**COMBE, ANDREW** (1797-1847), Scottish physiologist, was born in Edinburgh on the 27th of October 1797, and was a younger brother of George Combe. He served an apprenticeship in a surgery, and in 1817 passed at Surgeons' Hall. He proceeded to Paris to complete his medical studies, and whilst there he investigated phrenology on anatomical principles. He became convinced of the truth of the new science, and, as he acquired much skill in the dissection of the brain, he subsequently gave additional interest to the lectures of his brother George, by his practical demonstrations of the convolutions. He returned to Edinburgh in 1819 with the intention of beginning practice; but being attacked by the first symptoms of pulmonary disease, he was obliged to seek health in the south of France and in Italy during the two following winters. He began to practise in 1823, and by careful adherence to the laws of health he was enabled to fulfil the duties of his profession for nine years. During that period he assisted in editing the *Phrenological Journal* and contributed a number of articles to it, defended phrenology before the Royal Medical Society of Edinburgh, published his *Observations on Mental Derangement* (1831), and prepared the greater portion of his *Principles of Physiology Applied to Health and Education*, which was issued in 1834, and immediately obtained extensive public favour. In 1836 he was appointed physician to Leopold I., King of the Belgians, and removed to Brussels, but he speedily found the climate unsuitable and returned to Edinburgh, where he resumed his practice. In 1836 he published his *Physiology of Digestion*, and in 1838 he was appointed one of the physicians extraordinary to the queen in Scotland. Two years later he completed his *Physiological and Moral Management of Infancy*, which he believed to be his best work and it was his last. His latter years were mostly occupied in seeking at various health resorts some alleviation of his disease; he spent two winters in Madeira, and tried a voyage to the United States, but was compelled to return within a few weeks of the date of his landing at New York. He died at Gorgie, near Edinburgh, on the 9th of August 1847.

His biography, written by George Combe, was published in 1850.

**COMBE, GEORGE** (1788-1858), Scottish phrenologist, elder brother of the above, was born in Edinburgh on the 21st of October 1788. After attending Edinburgh high school and university he entered a lawyer's office in 1804, and in 1812 began to practise on his own account. In 1817 the *Edinburgh Review* contained an article on the system of "craniology" of F. J. Gall and K. Spurzheim, which was denounced as "a piece of thorough quackery from beginning to end." Combe laughed like others at the absurdities of this so-called new theory of the brain, and thought that it must be finally exploded after such an exposure; and when Spurzheim delivered lectures in Edinburgh, in refutation of the statements of his critic, Combe considered the subject unworthy of serious attention. He was, however, invited to a friend's house where he saw Spurzheim dissect the brain, and he was so far impressed by the demonstration that he attended the second course of lectures. Investigating the subject for himself, he became satisfied that the fundamental principles of phrenology were true—namely "that the brain is the organ of mind; that the brain is an aggregate of several parts, each subserving a distinct mental faculty; and that the size of the cerebral organ is, ceteris paribus, an index of power or energy of function." In 1817 his first essay on phrenology was published in the *Scots Magazine*; and a series of papers on the same subject appeared soon afterwards in the *Literary and Statistical Magazine*; these were collected and published in 1819 in book form as *Essays on Phrenology*, which in later editions became *A System of Phrenology*. In 1820 he helped to found the Phrenological Society, which in 1823 began to publish a *Phrenological Journal*, and from 1824 to 1828 he devoted much attention to the subject on the continent of Europe and in America, as well as at home; and a long discussion with Sir William Hamilton in 1827-1828 excited general interest.

His most popular work, *The Constitution of Man*, was published in 1828, and in some quarters brought upon him denunciations as a materialist and atheist. From that time he saw everything by the light of phrenology. He gave time, labour and money to help forward the education of the poorer classes; he established the first infant school in Edinburgh; and he originated a series of evening lectures on chemistry, physiology, history and moral philosophy. He studied the criminal classes, and tried to solve the problem how to reform as well as to punish them; and he strove to introduce into lunatic asylums a humane system of treatment. In 1836 he offered himself as a candidate for the chair of logic at Edinburgh, but was rejected in favour of Sir William Hamilton. In 1838 he visited America and spent about two years lecturing on phrenology, education and the
treatment of the criminal classes. On his return in 1840 he published his *Moral Philosophy*, and in the following year his *Notes on the United States of North America*. In 1842 he delivered, in German, a series of twenty-two lectures on the university of Heidelberg, and he travelled much in Europe, inquiring into the management of schools, prisons and asylums.

The commercial crisis of 1855 elicited his remarkable pamphlet on *The Currency Question* (1858). The culmination of the religious thought and experience of his life is contained in his work *On the Relation between Science and Religion*, first publicly issued in 1857. He was engaged in revising the ninth edition of the *Constitution of Man* when he died at Moor Park, Farnham, on the 14th of August 1858. He married in 1833 Cecilia Siddons, a daughter of the great actress.

**COMBE, WILLIAM** (1741-1823), English writer, the creator of "Dr Syntax," was born at Bristol in 1741. The circumstances of his birth and parentage are somewhat doubtful, and it is questioned whether his father was a rich Bristol merchant, or a certain William Alexander, a London alderman, who died in 1762. He was educated at Eton, where he was contemporary with Charles James Fox, the 2nd Baron Lyttelton and William Beckford. Alexander bequeathed him some £2000—a little fortune for a private school in the eighteenth century—a legacy which gained him the nickname of Count Combe; and after a cherquered career as private soldier, cook and waiter, he finally settled in London (about 1771), as a law student and bookseller's hack. In 1776 he made his first success in London with *The Diaboliad*, a satire full of bitter personalities. Four years afterwards (1780) his debts brought him into the King's Bench; and much of his subsequent life was spent in prison. His spurious *Letters of the Late Lord Lyttelton* (1780) imposed on many of his contemporaries, and a writer in the *Quarterly Review*, so late as 1831, regarded these letters as authentic, basing upon them a claim that Lyttelton was "Junius." An early acquaintance with Lawrence Sterne resulted in his *Letters supposed to have been written by Yorick and Eliza* (1779). Periodical literature of all sorts—pamphlets, satires, burlesques, "two thousand columns for the papers," "two hundred biographies"—filled up the next years, and about 1789 Combe was receiving £200 yearly from Pitt, as pamphleteer. Six volumes of *Devil on Two Sticks in England* won him the title "to the "English le Sage"; in 1794-1796 he wrote the text for Bowdler's *History of the World*, and began to write for the *Times*. In 1809-1811 he wrote for Ackermann's *Political Magazine* the famous *Tour of Dr Syntax in search of the Picturesque* (descriptive and moralizing verse of a somewhat doggerel type), which, owing greatly to Thomas Rowlandson's designs, had an immense success. It was published separately in 1812 and was followed by two similar *Tours*, "in search of Consolation," and "in search of a Wife," the first Mrs Syntax having died at the end of the first Tour. Then came *Six Poems* in illustration of drawings by Princess Elizabeth (1831), *The English Dance of Death* (1815-1816), *The Dance of Life* (1816-1817), *The Adventures of Johnny Quae Genus* (1822)—all written for Rowlandson's caricatures; together with *Histories* of Oxford and Cambridge, and of Westminster Abbey for Ackermann; *Pictureque Tours* along the Rhine and other rivers, *Histories of Madeira*, *Antiquities of York*, texts for *Turner's Southern Coast Views*, and contributions innumerable to the *Literary Repository*. In his later years, notwithstanding a by no means unkindly character, Combe was courted for the sake of his charming company, his good books and anecdotes. He died in London on the 19th of June 1823.

Brief obituary memoirs of Combe appeared in Ackermann's *Literary Repository* and in the *Gentleman's Magazine* for August 1823; and in May 1859 a list of his works, drawn up by his own hand, was printed in the latter periodical. See also Diary of H. Crabb Robinson, *Notes and Queries* for 1869.

1 Thomas, 2nd Baron Lyttelton (1744-1779), commonly known as the "wicked Lord Lyttelton," was famous for his abilities and his libertinism, also for the mystery attached to his death, of which it was alleged he was warned in a dream three days before the event.

**COMBE, or COOMB,** a term particularly in use in south-western England for a short, closed-in valley, either on the side of a down or running up from the sea. It appears in place-names as a termination, e.g. Wiveliscombe, Ilfracombe, and as a prefix, e.g. Combemartin. The etymology of the word is obscure, but "hollow" seems a common meaning to similar forms in many languages. In English "combe" or "cumb" is an obsolete word for a "hollow vessel," and the like meaning attached to Teutonic forms *kummi* and *kumme*. The Welsh *cwm*, in place-names, means hollow or valley, with which may be compared *cum* in many Scots place-names. The Greek κόμβος also means a hollow vessel, and there is a French dialect word *combe* meaning a little valley.

**COMBERMERE, STAPLETON COTTON, 1st Viscount** (1773-1865), British field-marshall and colonial of the 1st Life Guards, was the second son of Sir Robert Salisbury Cotton of Combermere Abbey, Cheshire, and was born on the 14th of November 1773, at Llewenn Hall in Denbighshire. He was educated at Westminster School, and when only sixteen obtained a second lieutenancy in the 23rd regiment (Royal Welsh Fusiliers). A few years afterwards (1793) he became by purchase captain in the 17th Dragoons, and served in that regiment during the campaigns of the duke of York in Flanders. While yet in his twentieth year, he joined the 25th Light Dragoons (subsequently 22nd) as lieutenant-colonel, and, while in attendance with his regiment on George III. at Weymouth, he became a great favourite of the king. In 1796 he went with his regiment to India, taking part en route in the operations in Cape Colony (July-August 1796), and in 1799 served in the war with Tipu Sahib, and at the storming of Seringapatam. Soon after this, having become heir to the family baronetcy, he was, at his father's desire, exchanged into a regiment at home, the 16th Light Dragoons. He was stationed in Ireland during Emmett's insurrection, became colonel in 1800, and major-general five years later. From 1806 to 1814 he was M.P. for Newark. In 1808 he was sent to the seat of war in Portugal, where he shortly rose to the position of commander of Wellington's cavalry, and it was here that he most displayed that courage and judgment which won for him his fame as a cavalry officer. He succeeded to the baronetcy in 1809, but continued his military career. His share in the battle of Salamanca (22nd of July 1812) was especially marked, and he received the personal thanks of Wellington. The day after he was accidentally wounded. He was now a lieutenant-general in the British army and a K.B., and on the conclusion of peace (1814) was raised to the peerage under the style of Baron Combermere. He was not present at Waterloo, the command, which he expected, and bitterly regretted not receiving, having been given to Lord Uxbridge. When the latter was wounded Cotton was sent for to take over his command, and he remained in France until the reduction of the allied army of occupation. In 1817 he was appointed governor of Barbadoes and commander of the West Indian forces. From 1822 to 1825 he commanded in Ireland. His career of active service was concluded in India (1826), where he besieged and took Bhurtpore—a fort which twenty-two years previously had defied the genius of Lake and was deemed impregnable. For this service he was created Viscount Combermere. A long period of peace and honour still remained to him at home. In 1834 he was sworn a privy councillor, and in 1852 he succeeded Wellington as constable of the Tower and lord lieutenant of the Tower Hamlets. In 1847 he was made a field-marshal and G.C.B. He died at Clifton on the 21st of February 1856. Another statue, in bronze, the work of Baroni Marochetti, was raised in his honour at Chester by the inhabitants of Cheshire. Combermere was succeeded by his only son, William Henry (1818-1891), and the viscountcy is still held by his descendants.

**COMBES, [JUSTIN LOUIS] ÉMILE** (1835-1901), French statesman, was born at Roquecourbe in the department of the Tarn. He studied for the priesthood, but abandoned the idea before ordination, and took the diploma of doctor of letters (1862),
Then he studied medicine, taking his degree in 1867, and setting up in practice at Pons in Charente-Inférieure. In 1881 he presented himself as a political candidate for Saintes, but was defeated. In 1885 he was elected to the senate by the department of Charente-Inférieure. He sat with the Democratic left, and was elected vice-president in 1893 and 1894. The reports which he drew up upon educational questions drew attention to him, and on the 3rd of November 1893 he entered the Bourgeois cabinet as minister of public instruction, resigning with his colleagues on the 21st of April following. He actively supported the Waldock-Rousseau ministry, and upon its retirement in 1903 he was himself charged with the formation of a cabinet. In this he took the portfolio of the Interior, and the main energy of the government was devoted to the struggle with clericalism. The parties of the Left in the chamber, united upon this question in the Bloc républicain, supported Combes in his application of the law of 1901 on the religious associations, and voted the new bill on the congregations (1904), and under his guidance France took the first definite steps toward the separation of church and state. He was opposed with extreme violence by all the Conservative parties, who regarded the secularization of the schools as a persecution of religion. But his stubborn enforcement of the law won him the applause of the people, who called him familiarly le petit pesce; finally the decision of the Radical and Socialist parties induced him to resign on the 17th of January 1905, although he had not met an adverse vote in the Chamber. His policy was still carried on; and when the law of the separation of church and state was passed, all the leaders of the Radical parties entertained him at a noteworthy banquet in which they openly recognized him as the real originator of the movement.

**COMBINATION—COMBINATORIAL ANALYSIS**

**COMBINATION.** (Lat. combinare, to combine), a term meaning an association or union of persons for the furtherance of a common object, historically associated with agreements amongst workmen for the purpose of raising their wages. Such a combination was for a long time expressly prohibited by statute. See Trade Unions; also Conspiracy and Strikes and Lock Outs.

**COMBINATORIAL ANALYSIS.** The Combinatorial Analysis, as it was understood up to the end of the 18th century, was of limited scope and restricted application. P. Nicholson, in his Essays on the Combinatorial Analysis, published in 1818, states that "the Combinatorial Analysis is a branch of mathematics which teaches us to ascertain and exhibit all the possible combinations in which the same things may be associated and mixed together; so that we may be certain that we have not missed any combination or arrangement of these things that has not been enumerated." Writers on the subject seemed to recognize fully that it was in need of cultivation, that it was of much service in facilitating algebraic operations of all kinds, and that it was the fundamental method of investigation in the theory of Probabilities. Some idea of its scope may be gathered from a statement of the parts of algebra to which it was commonly applied, viz., the expansion of a multinomial, the product of two or more multinomials, the quotient of one multinomial by another, the reversion and conversion of series, the theory of indeterminate equations, &c. Some of the elementary theorems and various particular problems appear in the works of the earliest algebraists, but the true pioneer of modern researches seems to have been Abraham Demeivre, who first published in Phil. Trans. (1697) the law of the general coefficient in the expansion of the series \(a + bx + cx^2 + dx^3 + \ldots\) raised to any power. (See also Miscellanea Analytica, bk. iv. chap. ii. prop. iv.) His work on Probabilities would naturally lead him to consider questions of this nature. An important work at the time it was published was the De Partitione Numerorum of Leonhard Euler, in which the consideration of the reciprocal of the product \((1 - x_2)(1 - x_2)^2(1 - x_2)^3\ldots\) establishes a fundamental connexion between arithmetic and algebra, arithmetical addition being made to depend upon algebraical multiplication, and a close bond is secured between the theories of discontinuous and continuous quantities. (Cf. Numbers, Partition of) The multiplication of the two powers \(x^2, x^3\), viz. \(x^2 + x^3 = p + q\), showed Euler that he could convert arithmetical addition into algebraical multiplication, and in the paper referred to he gives the complete formal solution of the main problems of the partition of numbers. He did not obtain general expressions for the coefficients which arose in the expansion of his generating functions, but he gave the actual values to a high order of the coefficients which arise from the generating functions corresponding to various conditions of partitionment. Other writers who have contributed to the solution of special problems are James Bernoulli, Ruggiero Giuseppe Bosovich, Karl Friedrich Hindenburg (1741-1808), William Emerson (1730-1782), Robert Woodhouse (1773-1827), Thomas Simpson and Peter Barlow. Problems of combination were generally undertaken as they became necessary for the advancement of some particular part of mathematical science: it was not recognized that the theory of combinations is in reality a science by itself, well worth studying for its own sake irrespective of applications to other parts of analysis. There was a total absence of orderly development, and until the first third of the 19th century had passed, Euler's classical paper remained alike the chief result and the only scientific method of combinatorial analysis.

In 1846 Karl G. J. Jacobi studied the partitions of numbers by means of certain identities involving infinite series that are met in the theory of elliptic functions. The method employed is essentially that of Euler. Interest in England was aroused, in the first instance, by Augustus De Morgan in 1846, who, in a letter to Henry Warburton, suggested that combinatorial analysis stood in great need of development, and alluded to the theory of partitions. Warburton, to some extent under the guidance of De Morgan, prosecuted researches by the aid of a new instrument, viz. the theory of finite differences. This was a distinct advance, and he was able to obtain expressions for the coefficients in partition series in some of the simplest cases (Trans. Camb. Phil. Soc., 1849). This paper inspired a valuable paper by Sir John Herschel (Phil. Trans. 1850), who, by introducing the idea and notation of the circulating function, was able to present results in advance of those of Warburton. The new idea involved a calculus of the imaginary roots of unity. Shortly afterwards, in 1855, the subject was attacked simultaneously by Arthur Cayley and James Joseph Sylvester, and their combined efforts resulted in the practical solution of the problem that we have to-day. The former added the idea of the primary solution, and the latter invented the notation of the subject, and in his own special development the arithmetical term was denumerated. The next distinct advance was made by Sylvester, Fabian Franklin, William Pitt Durfee and others, about the year 1883 (Amer. Math. vol. v.) by the employment of a graphical method. The results obtained were not only valuable in themselves, but also threw considerable light upon the theory of algebraic series. So far it will be seen that researches had for their object the discussion of the partition of numbers. Other branches of combinatorial analysis were, from any general point of view, absolutely neglected. In 1888 P. A. MacMahon investigated the general problem of distribution, of which the partition of a number is a particular case. He introduced the method of symmetric functions and the method of differential operators, applying both methods to the two important subdivisions, the theory of composition and the theory of partition. He introduced the notion of the separation of a partition, and extended all the results so as to include multiparticle as well as unipartite numbers. He showed how to introduce zero and negative numbers, uniparticulate and multiparticulate, into the general theory; he extended Sylvester's graphical method to three dimensions; and finally, in 1898, he invented the "Partition Analysis" and applied it to the solution of novel questions in arithmetic and algebra. An important paper by G. B. Mathews, which reduces the problem of compound partition to that of simple partition, should also be noticed. This is the problem which was known to Euler and his contemporaries as "The Problem of the Virgins," or "the Rule of Ceres"; it is only now, nearly 200 years later, that it has been solved.
The most important problem of combinatorial analysis is connected with the distribution of objects into classes. A number \( n \) may be regarded as enumerating \( n \) similar objects; it is then said to be unipartite. On the other hand, if the objects be not all similar they cannot be effectively enumerated by a single integer; we require a succession of integers. If the objects be \( p \) in number of one kind, \( q \) of a second kind, \( r \) of a third, etc., the enumeration is given by the succession \( pqr \ldots \) which is termed a multipartite number, and written,

\[ \text{where } p+q+r+\ldots=n. \]

If the order of magnitude of the numbers \( p, q, r \ldots \) is immaterial, it is usual to write them in descending order of magnitude, and the succession may then be termed a partition of the number \( n \), and is written \( (pqr \ldots) \).

The succession of integers thus has a twofold significance: (i.) as a multipartite number it may enumerate objects of different kinds; (ii.) it may be viewed as a partition taken into separate parts of a unipartite number. We may say either that the objects are represented by the multipartite number \( pqr \ldots \), or that they are defined by the partition \( (pqr \ldots) \) of the unipartite number \( n \). Similarly the classes into which they are distributed may be \( n \) in number all similar; or they may be \( p_1 \) of one kind, \( q_1 \) of a second, \( r_1 \) of a third, etc., \( \text{where } p_1+q_1+r_1+\ldots=n \). We may thus denote the classes either by the multipartite numbers \( p_1q_1r_1 \ldots \), or by the partition \( (p_1q_1r_1 \ldots) \) of the unipartite number \( m \). The distributions to be considered are such that any number of objects may be in any one class subject to the restriction that no class is empty. Two cases arise. If the order of the objects in a particular class is immaterial, the class is termed a \textit{parcel}; if the order is material, the class is termed a \textit{group}. The distribution into parcels is alone considered here, and the main problem is the enumeration of the distributions of objects defined by the partition \( (pqr \ldots) \) of the number \( n \) into \( m \) classes defined by the partition \( (pqr \ldots) \) of the number \( m \). (See "Symmetric Functions and the Theory of Distributions," Proc. London Mathematical Society, vol. xix.)

Three particular cases are of great importance. Case I. is the "one-to-one distribution," in which the number of parcels is equal to the number of objects, and one object is distributed in each parcel. Case II. is that in which the parcels are all different, being defined by the partition \((1111\ldots)\); this is the theory of the compositions of unipartite and multipartite numbers. Case III. is that in which the parcels are all similar, being defined by the partition \((m)\); this is the theory of the partitions of unipartite and multipartite numbers. Previous to discussing these in detail, it is necessary to describe the method of symmetric functions which will be largely utilized.

Let \( \alpha, \beta, \gamma, \ldots \) be the roots of the equation

\[ x^m-a_1x^{m-1}+a_2x^{m-2}-\ldots=0. \]

The symmetric function \( \Sigma \alpha^p \beta^q \gamma^r \ldots \), where \( p+q+r+\ldots=n \), is in the partition notation, written \((pqr\ldots)\). Let \( A_{(pqr\ldots)} \) denote the number of ways of distributing the \( n \) objects defined by the partition \((pqr\ldots)\) into the \( m \) parcels defined by the partition \((pqr\ldots)\). The expression

\[ \Sigma A_{(pqr\ldots)}(pqrs\ldots \ldots) \]

where the numbers \( p_1, q_1, r_1 \ldots \) are fixed and assumed to be in descending order of magnitude, the summation being for every partition \((pqr\ldots)\) of the number \( n \), is defined to be the distribution function of the objects defined by \((pqr\ldots)\) into the parcels defined by \((pqr\ldots)\). It gives a complete enumeration of \( n \) objects of whatever species into parcels of the given species.

1. One-to-One Distribution. Parcels \( m \) in number (i.e., \( m=n \)).

\[ \text{Case I.} \]

Let \( h_i \) be the homogeneous product-sum of degree \( s \) of the quantities \( \alpha, \beta, \gamma, \ldots \) so that

\[ h_i=\Sigma a_1^{\alpha-s}a_2^{\beta-s}a_3^{\gamma-s}+\ldots \]

Form the product \( h_ih_jh_k \ldots \)

Any term in \( h_i \) may be regarded as derived from \( p_i \) objects distributed into \( p_i \) similar parcels, one object in each parcel, since the order of occurrence of the letters \( \alpha, \beta, \gamma \ldots \) in any term is immaterial. Moreover, every selection of \( q_i \) letters from the letters in \( \sigma^p\beta^q \gamma^r \ldots \) will occur in some term of \( h_i \), every further selection of \( q_i \) letters will occur in some term of \( h_i \), and so on. Therefore in the product \( h_ih_jh_k \ldots \) the term \( \sigma^p\beta^q \gamma^r \ldots \) and therefore also the symmetric function \((pqr\ldots)\), will occur as many times as it is possible to distribute objects defined by \((pqr\ldots)\) into parcels defined by \((pqr\ldots)\) one object in each parcel. Hence

\[ \Sigma A_{(pqr\ldots)}(pqrs\ldots) \]

This theorem is of algebraic importance; for consider the simple particular case of the distribution of objects \((43)\) into parcels \((52)\), and represent objects and parcels by small and capital letters respectively. One distribution is shown by the scheme

A A A A B B

in which an object denoted by a small letter is placed in a parcel denoted by the capital letter immediately above it. We may interchange small and capital letters and derive from it a distribution of the objects \((52)\) into parcels \((43)\), viz.,

A A A A B B

and generally,

\[ X_s=2^n \prod x_i^{m_i} \]

and the summation being in regard to every partition of \( s \). Consider the result of the multiplication

\[ X_sX_{s_1}X_{s_2} \ldots = 2^n \prod x_i^{m_i} \]

To determine the nature of the symmetric function \( P \), a few definitions are necessary.

Definition 1. Of a number \( n \) take any partition \((\lambda_1\lambda_2 \ldots \lambda_k)\) and separate it into component partitions thus:

\[ (\lambda_1\lambda_2 \ldots \lambda_k) = (\lambda_1) (\lambda_2) \ldots (\lambda_k) \]

in any manner. This may be termed a separation of the partition, the numbers occurring in the separation being identical with those which occur in the partition. In the theory of symmetric functions the separation denotes the product of symmetric functions

\[ \Sigma(x_i^{\lambda_1}x_j^{\lambda_2}x_k^{\lambda_3} \ldots) \]

The portions \((\lambda_1\lambda_1\lambda_2\ldots \ldots)\) are termed separated, and if \( \lambda_1 \lambda_2 \ldots \lambda_k = p_1p_2p_3p_4 \ldots \lambda_k \lambda_1 \lambda_2 \ldots \lambda_k \lambda_1 \lambda_2 \ldots \ldots \)

Now it is clear that \( P \) consists of an aggregate of terms, each of which, to a numerical factor \( \alpha \), is a separation of the partition \((\alpha_1 \alpha_2 \alpha_3 \ldots)\) of species \((pqr\ldots)\). Further, \( P \) is the distribution function of objects into parcels denoted by \((pqr\ldots)\), subject to the restriction that the distributions have each of them the specification

in the product
\[ \prod_i (x_i + \cdots + x_n) \]
and thus the number of arithmetical correspondences obtainable is subject to no finite limit (cf. MacMahon, loc. cit. pp. 125 et seq.).

3. The Theory of Partitions. Parcels defined by \( m \).—When an ordinary unipartite number \( n \) is broken up into other numbers, and the order of occurrence of the numbers is immaterial, the collection of numbers is termed a partition of the number \( n \). It is usual to arrange the numbers comprised in the collection, termed the parts of the partition, in descending order of magnitude, and to indicate repetitions of the same part by the use of exponents. Thus \((32111)\), a partition of 8, is written \((321^31^2)\).

Euler's pioneering work on the subject rests on the observation that the algebraic multiplication
\[ x_1 x_2 \cdots x_n = x_1^{a_1} x_2^{a_2} \cdots x_n^{a_n} \]
is equivalent to the arithmetical addition of the exponents \( a_1, a_2, \ldots \). He showed that the number of ways of composing \( n \) with \( p \) integers drawn from the series \( a, b, c, \ldots \) repeated or not, is equal to the coefficient of \( x_1^{a_1} x_2^{a_2} \cdots x_n^{a_n} \) in the ascending expansion of the fraction
\[ \prod \frac{1}{1 - x_i^{a_i} x_2^{a_2} \cdots x_n^{a_n}} \]
which he termed the generating function of the partitions in question.

If the partitions are to be composed of \( p_1 \) or fewer parts, it is merely necessary to multiply this fraction by \( \frac{1}{1 - x} \). Similarly, if the parts are to be unrepeatable, the generating function is the algebraic product
\[ (1 + x)(1 + x^2)(1 + x^3) \cdots \]
each part may occur at most twice, \( n = 1 \), \( n = 2 \) and \( n = 3 \) are the most easily obtained, and generally if each part may occur at most \( k - 1 \) times it is
\[ \prod \frac{1}{1 - x^{k_i}} \]
It is thus easy to form generating functions for the partitions of numbers into parts subject to various restrictions. If there be no restriction in regard to the numbers of the parts, the generating function is
\[ \prod \frac{1}{1 - x^{k_i}} \]
and the problems of finding the partitions of a number \( n \), and of determining their number, are the same as those of solving and enumerating the solutions of the indeterminate equation in positive integers
\[ a_1 x_1 + a_2 x_2 + \cdots + a_n x_n = n \]
Euler considered also the question of enumerating the solutions of the indeterminate simultaneous equation in positive integers
\[ a_1 x_1 + a_2 x_2 + \cdots + a_n x_n = n \]
which was called by him and those of his time the "Problem of the Virgin." The enumeration is given by the coefficient of \( x_1^{a_1} x_2^{a_2} \cdots x_n^{a_n} \) in the expansion of the fraction
\[ \prod \frac{1}{1 - x^{a_i}} \]
which enumerates the partitions of the multipartite number \( m n n' n'' \cdots \)
into the parts \( a b c \cdots , a b^2 c \cdots \)
Sylvester has determined an analytical expression for the coefficient of \( x^n \) in the expansion of
\[ \prod \frac{1}{1 - x^{a_i} (1 - x^{e_i})} \]
To explain this we have two lemmas:

**Lemma 1.**—The coefficient of \( x^n \), \( i.e. \), after Cauchy, the residue in the ascending expansion of \((1 - x^{-i})^{-1} \) is \(-1 \). For when \( i \) is unity, it is obviously the case, and
\[
(1 - e^{-i})^{-1} = (1 - e^{-i})^{-1} \cdot e^{i(1 - e^{-i})^{-1}} = (1 - e^{-i})^{-1} \cdot \frac{d}{dx} (1 - e^{-i})^{-1} \cdot \frac{1}{e^{i(1 - e^{-i})^{-1}}}.
\]
Here the residue of \( \frac{d}{dx} (1 - e^{-i})^{-1} \) is zero, and therefore the residue of \((1 - e^{-i})^{-1} \) is unchanged when \( i \) is increased by unity, and is therefore always \(-1 \). For all values of \( i \), the exponential multiplied in succession by each of its values (zero excepted, if there be such), which makes the given fraction infinite.

**Lemma 2.**—The constant term in any proper algebraical fraction developed in ascending powers of its variable is the same as the residue, with changed sign, of the sum of the fractions obtained by substituting in the given fraction, in place of the variable, its exponential multiplied in succession by each of its values (zero excepted, if there be such), which makes the given fraction infinite.

For write the proper algebraical fraction
\[ F(x) = \sum \frac{\lambda_{n,m}}{(a_{n-m} - x)^{1 + \text{select}} x^\text{select}} \]
The constant term is \( \Sigma \sum \frac{c_{i,\mu}}{a_\mu} \)

Let \( a \) be a value of \( x \) which makes the fraction infinite. The residue of \( \Sigma \sum \frac{c_{i,\mu}}{(a_\mu - a)^2} \) is equal to the residue of \( \Sigma \sum \frac{c_{i,\mu}}{(a_\mu - a)^2} \), and when \( \nu = \mu \), the residue vanishes, so that we have to consider \( \frac{c_{i,\mu}}{a_\mu(1 - e)^2} \), and the residue of this is, by the first lemma,

\[ -\Sigma \frac{c_{i,\mu}}{a_\mu} \]

which proves the lemma.

TakeF \( x = \frac{1}{x^{(1-x^a)}(1-x^b)} \). \( x^n \) is the number of partitions of \( n \) into \( x \) parts of which \( x \) is its constant term.

Let \( \rho \) be a root of unity which makes \( f(x) \) infinite when substituted for \( x \). The function of which we have to take the residue is \( \rho \sum \frac{c_{i,\mu}}{(1-\rho x)^2} \),

we may divide the calculation up into sections by considering separately that portion of the summation which involves the primitive \( q \)th roots of unity, \( q \) being a divisor of one of the numbers \( a, b, \ldots \).

The qth term is

\[ \sum \rho^{-n} \frac{c_{i,\mu}}{(1-\rho x)^2} \]

which, putting \( \rho_\mu \) for \( \rho \) and \( \nu = \mu + 1 \), may be written

\[ \sum \rho_\mu^{-n} \frac{c_{i,\mu}}{(1-\rho_\mu x)^2} \]

Sylvester's graphical method.

Sylvester, Franklin, Durfee, G. S. Ely and others have evolved a constructive theory of partitions, the object of which is the contemplation of the partitions themselves, and the evolution of their properties from a study of their inherent characters. It is concerned for the most part with the partition of a number into parts drawn from the natural series of numbers 1, 2, 3 . . . . Any partition, say (521) of the number 8, is represented by nodes placed in order at the points of a rectangular lattice,

when the partition is given by the enumeration of the nodes by lines. If we enumerate by columns we obtain another partition of 8, viz. (321), which is termed the conjugate of the former. The fact of conjugacy was first pointed out by Norman Macleod Ferrers. If the original partition is one of a number \( n \) in i parts, of which the largest is \( j \), the conjugate is one into \( j \) parts, of which the largest is \( i \), and we obtain the theorem:—"The number of partitions of any number into \( i \) parts and having the largest part \( j \) equal or less than \( j \), remains the same when the numbers \( i \) and \( j \) are interchanged."

The study of this representation on a lattice (termed by Sylvester the "graph") yields many theorems similar to that just given, and, moreover, throws considerable light upon the expansion of algebraic series.

The theorem of reciprocity just established shows that the number of partitions of \( n \) into \( j \) parts or fewer, is the same as the number of ways of composing \( n \) with the integers 1, 2, 3, . . . . Hence we can expand \( (1-x^a)(1-x^{a+b})(1-x^{a+b+c}) \ldots \) for the coefficient of \( a^0 \) in the expansion is the number of ways of composing \( n \) with \( j \) or fewer parts, and this we have seen in the coefficients of \( a^0 \) in the ascending expansion of \( \frac{1}{1-x} = 1+x+x^2+ \ldots \). Therefore

\[ \frac{1}{1-x-a} = 1+a-a^2+1-a^3+ \ldots \]

The coefficient of \( a^0 \) in the expansion of \( \frac{1}{1-x-a} \) denotes the number of ways of composing \( n \) with \( j \) or fewer parts, none of which are greater than \( i \). The expansion is known to be

\[ \frac{1}{1-x-a} = 1-x-a-x^2-a^2+1-x-a^3+ \ldots \]

which, observe, is altered by interchange of \( i \) and \( j \).

Franklin has also similarly established the identity of Euler

\[ (1-x)(1-x^a)(1-x^b) \ldots \]

known as the "pentagonal number theorem," which on interpretation shows that the number of ways of partitioning \( n \) into an even number of unremarked parts is equal to that into an uneven number, except when \( n \) has the pentagonal number form \((3j^2-\frac{1}{2})\), \( j \) a positive or negative, when the difference between the numbers of the partitions is \((\frac{1}{2})\).

To illustrate an important dissection of the graph we will consider those graphs which read the same by columns as by lines; these are called self-conjugate. Such a graph may be obviously dissected into a square, containing say \( \theta \) nodes, and into two graphs, one lateral and one subjecent, the latter being the conjugate of the former. The former graph is limited to contain not more than \( \theta \) parts, but is subject to no other condition. Hence the number of self-conjugate

partitions of \( n \) which are associated with a square of \( \theta \) nodes is clearly equal to the number of partitions of \((\frac{1}{2}(n-\theta))\) into \( \theta \) or fewer parts, i.e. it is the coefficient of \( x^{(1-\theta)} \) in

\[ \frac{1}{1-x} = 1-x^2-x^3- \ldots \]

or of \( x^\theta \) in

\[ \frac{1}{1-x-x^2-x^3-} = x^\theta\]

and the whole generating function is

\[ 1+\frac{1}{1-x-x^2-x^3-} = x^{\theta+2}\]

Now the graph is also composed of \( \theta \) angles of nodes, each angle containing an uneven number of nodes; hence the partition is transformable into one containing \( \theta \) unequal uneven numbers. In the case depicted this partition is \((17, 5, 1)\). Hence the number of the partitions based upon a square of \( \theta \) nodes is the coefficient of \( x^{\theta(a)} \) in the product \( (1+x)(1+x^2)(1+x^3) \ldots (1+x^\theta) \ldots \) and the coefficient of \( a^{\theta} \) in this product is \( x^\theta \) and we have the expansion

\[ (1+a)(1+ax)(1+ax^2) \ldots \]

Again, if we restrict the part magnitude to \( \iota \), the largest angle contains at most \( 2\iota \) nodes, and based upon a square of \( \theta \) nodes we have partitions enumerated by the coefficient of \( a^{\theta} \) in the product \((1+a)(1+ax)(1+ax^2) \ldots (1+ax^{\theta-1})\); moreover the same number enumerates the partition of \((\frac{1}{2}(n-\theta))\) into \( \theta \) or fewer parts, of which the largest part is equal to or less than \( \iota \), and, is thus given by the coefficient of \( x^{(1-\iota)} \) in the expansion of

\[ \frac{1}{1-x} = 1-x^2-x^3- \ldots \]
The principle in directions and represented perpendicular of solutions.

There is no difficulty in extending the graphical method to three dimensions, and we have then a theory of a special kind of partition of multipartite numbers. Of such kind is the partition

\[ (a_1 a_2 a_3, \ldots, b_1 b_2 b_3, \ldots) \]

of the multipartite number

\[ (a_1 + a_2 + a_3 + \ldots, b_1 + b_2 + b_3 + \ldots) \]

for then the graphs of the parts \( a_1 a_2 a_3, \ldots \) are superposable, and we have what we may term a regular graph in three dimensions. Thus the partition \((643, 632, 411)\) of the multipartite \((16, 8, 6)\) leads to the graph

![Graph Image]

and every such graph is readable in six ways, the axis of \( z \) being perpendicular to the plane of the paper.

Ex. Gr.

Plane parallel to \( xy \), direction \( Ox \) reads (643, 632, 411)

\[ \begin{array}{c}
\text{Ex. Gr.} \\
\text{Plane parallel to} \ xy, \ \text{direction} \ Ox \ \text{reads}(643,632,411) \\
\end{array} \]

and if we write the expansion of that portion which involves products of the letters \( a, b, \gamma, \ldots \) of degree \( r \) in the form

\[ 1 + b \alpha x + b \beta x^2 + \ldots \]

we may write the development

\[ \left[ (1 + bx, 1 - b' x + b'' x^2, \ldots) \right] \]

and picking out the coefficient of \( b^n x^n \) we find

\[ t_1 t_2 t_3 \]

where

\[ \Sigma r = m, \ \Sigma t = n. \]

The quantities \( h \) are symmetric functions of the quantities \( a, b, \gamma, \ldots \) which in simple cases can be calculated without difficulty, and then the distribution function can be formed.

Ex. Gr.—Required the enumeration of the partitions of all multipartite numbers \((p_1 p_2 \ldots)\) into exactly two parts. We find

\[ h_2 = h_1 - h_i + h^2 \]

\[ h_3 = h_2 - h_i + h_2 \]

\[ h_4 = h_3 - h_i + h_2 \]

and paying attention to the fact that in the expression of \( h_4 \) the term \( h^3 \) is absent when \( r \) is uneven, the law is clear. The generating function is

\[ h_0 x^0 + h_1 x^1 + (h_1 + h^2_2)x^2 + (h_2 + h_1 + h_3)x^3 + (h_3 + h_2 + h_1 + h_4)x^4 + (h_4 + h_3 + h_2 + h_1 + h_5)x^5 + (h_5 + h_4 + h_3 + h_2 + h_1 + h_6)x^6 + \ldots \]

Taking \( h_2 = h_1 + (2 + 1)^2 \)

\[ = 2(4 + 3 + 1) + 4 + 2(17 + 7 + 1) \]

the term \( 5(21) \) indicates that objects such as \( a, a, b, c \) can be partitioned in five ways into two parts. These are \( a b, a c, b a, c a, b c, a b, a c, b a, c a, b c \). The function \( h_2 \) has been studied. (See MacMahon, Proc. Lond. Math. Soc. vol. xix.) Putting \( x = 1 \) equal to unity, the function may be written

\[ (h_0 + h_1 + h_2 + \ldots)(1 + h_1 + h_2 + h_3 + \ldots) \]

an evident formula.

The method of differential operators, of wide application to problems of combinatorial analysis, has for its leading idea the designing of a function and of a differential operator, so that when the operator is performed upon the function a number is reached which enumerates the solutions of the given problem. Generally speaking, the problems considered are such as are connected with lattices, or as it is possible to connect with lattices.

To take the simplest possible example, consider the problem of finding the number of permutations of \( n \) different letters. The
function is here $x^n$, and the operator $\left(\frac{d}{dx}\right)^n = \delta^*_n$, yielding $\delta^*_n x^n = n!$

the number which enumerates the permutations. In fact—

$$\delta^*_n x^n = \delta_1 x + \delta_2 x^2 + \delta_3 x^3 + \cdots$$

and differentiating we obtain a sum of $n$ terms by striking out an $x$ from the product in all possible ways. Fixing upon any one of these terms, say $x \cdot x \cdot x \cdot \cdots$, we again operate with $\delta_1$ by striking out an $x$ in all possible ways, and one of the terms so reached is $x \cdot x \cdot x \cdot \cdots$. Fixing upon this term, and again operating and continuing the process, we finally arrive at one solution of the problem, which (taking say $n=4$) may be said to be in correspondence with the operator diagram—

<table>
<thead>
<tr>
<th>$\delta_1$</th>
<th>$\delta_2$</th>
<th>$\delta_3$</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>1</td>

<tr>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

the number in each row of compartments denoting an operation of $\delta_1$. Hence the permutation problem is equivalent to that of placing $n$ units in the compartments of a square lattice of order $n$ in such manner that each row and each column contains a single unit. Observe that the method not only enumerates, but also gives a process by which each solution is actually formed. The same problem is that of placing $n$ rooks upon a chess-board of $n^2$ compartments, so that no rook can be captured by any other rook.

Regarding these elementary remarks as introductory, we proceed to give some typical examples of the method. Take a lattice of $m$ columns and $n$ rows, and consider the problem of placing units in the compartments in such wise that the $m$th column shall contain $\lambda_m$ units ($\lambda_m = 1, 2, 3, \ldots m$), and the $m$th row $p_m$ units ($p_m = 1, 2, 3, \ldots n$). Writing

$$1 + a_1 x + a_2 x^2 + \cdots + \cdots = \frac{1}{1 - (1 + a_2 x)(1 + a_3 x)(1 + a_4 x)\cdots}$$

and $D_p = \frac{1}{1 - (\delta_1 p_1 + \delta_2 x + a_3 x + \cdots)}$, the multiplication being symbolic, so that $D_p$ is an operator of order $p$, the function is

$$\alpha_1, \alpha_2, \ldots \alpha_n = \cdots + \Delta^2 \alpha_1, \alpha_2, \ldots \alpha_n = \cdots$$

and the operator $D_p D_{p_2} D_{p_3} \cdots D_{p_n}$ enumerates the solutions. For the mode of operation of $D_p$ upon a product reference must be made to the section on “Differential Operators” in the article ALGEBRAIC FORMS. Writing

$$\alpha_1, \alpha_2, \ldots \alpha_n = \cdots + A \alpha_1, \alpha_2, \ldots \alpha_n = \cdots$$

or, in partition notation,

$$(1^n)(1^n)\cdots(1^n) = \cdots + A (p_1 p_2 \cdots p_n) \cdots +$$

$D_p D_{p_2} D_{p_3} \cdots D_{p_n}$ and $D_{p_1} D_{p_2} D_{p_3} \cdots D_{p_n}$, the law by which the operation is performed upon the product shows that the solutions of the given problem are enumerated by the number $A$, and that the process of operation actually represents each solution.

EX. Gr.—Take $\lambda_1 = 3$, $\lambda_2 = 2$, $\lambda_3 = 1$,

$$D_3 D_2 D_1 = 1 \cdot 1 \cdot 1 = 1, \quad D_2 D_1 D_1 = 1 \cdot 1 \cdot 1 = 1, \quad D_1 D_2 D_1 = 1 \cdot 1 \cdot 1 = 1,$$

and the process yields the eight diagrams:

<table>
<thead>
<tr>
<th>1</th>
<th>1</th>
<th>1</th>

</tr>
</tbody>
</table>

the solutions are enumerated by

$$D_p D_{p_2} \cdots D_{p_n}$$

Putting as before $\lambda_1 = 3$, $\lambda_2 = 2$, $\lambda_3 = 1$, $p_1 = 1$, $p_2 = 1$, $p_3 = 1$, $p_4 = 1$, the reader will have no difficulty in constructing the diagrams of the eighteen solutions.

The next and last example of a multitude that might be given shows the extraordinary power of the method by solving the famous problem of the “Latin Square,” which for hundreds of years had proved beyond the powers of mathematicians. The problem consists in placing $n$ letters $a, b, c, \ldots n$ in the compartments of a square lattice of $n^2$ compartments, no compartment empty, so that no letter occurs twice either in the same row or in the same column. The function is here

$$\Sigma a^{n-1} a^{n-2} \cdots a^2 a_1 = a_n$$

and the operator $D_n$, the enumeration being given by

$$D_n = \left(\Sigma a^{n-1} a^{n-2} \cdots a^2 a_1 a_n\right)$$

(P. A. M.)

COMBUSTION (from the Lat. combustur, to burn up), in chemistry, the process of burning or, more scientifically, the oxidation of a substance, generally with the production of flame and the evolution of heat. The term is more customarily given to productions of flame such as we have in the burning of oils, gas, fuel, &c., but it is conveniently extended to other cases of oxidation, such as are met with when metals are heated for a long time in air or oxygen. The term "spontaneous combustion" is used when a substance smoulders or inflames apparently without the intervention of any external heat or light; in such cases, as, for example, in heaps of cotton-waste soaked in oil, the oxidation has proceeded slowly, but steadily, for some time, until the heat evolved has raised the mass to the temperature of ignition.

The explanation of the phenomena of combustion was attempted at very early times, and the early theories were generally bound up in the explanation of the nature of fire or flame. The idea that some extraneous substance is essential to the process is of ancient date; Clement of Alexandria (c. 3rd century A.D.) held that some "air" was necessary, and the same view was accepted during the middle ages, when it had been also found that the products of combustion weighed more than the original combustible, a fact which pointed to the conclusion that some substance had combined with the combustible during the process. This theory was supported by the French physician Jean Ray, who showed also that in the cases of tin and lead there was a limit to the increase in weight. Robert Boyle, who made many researches on the origin and nature of fire, regarded the increase as due to the fixation of the particles of fire. Ideas identical with these were expressed by John Mayow in his Tractatus quinque melico-physicus (1674), but his death in 1679 undoubtedly accounts for the neglect of his suggestions by his contemporaries.

Theories which attempted the similarity of the processes of combustion and connection, and showed that one constituent of the atmosphere, which he termed spiritus nitro-acereus, was essential to combustion and life, and that the second constituent, which he termed spiritus nitri acidi, inhibited combustion and life. At the beginning of the 15th century a new theory of combustion was promulgated by Georg Ernst Stahl. This theory regarded combustibility as due to a principle named phlogiston (from the Gr. φλογίτως, burnt), which was present in all combustible bodies in an amount proportional to their degree of combustibility; for instance, coal was regarded as practically
pure phlogiston. On this theory, all substances which could be burnt were composed of phlogiston and some other substance, and the process of burning was simply equivalent to the liberation of the phlogiston. The Stahlian theory, originally a theory of combustion, came to be a general theory of chemical reactions, since it provided simple explanations of the ordinary chemical processes (when regarded qualitatively) and permitted generalizations which largely stimulated its acceptance. Its inherent defect—that the products of combustion were invariably heavier than the original substance instead of less as the theory demanded—was ignored, and until late in the 18th century it dominated chemical thought. Its overthrow was effected by Lavoisier, who showed that combustion was simply an oxidation, the oxygen of the atmosphere (which was isolated at this time by K. W. Scheele and J. Priestley) combining with the substance burnt.

**COMEDY**, the general term applied to a type of drama the chief object of which, according to modern notions, is to amuse. It is contrasted on the one hand with tragedy and on the other with farce, burlesque, &c. As compared with tragedy it is distinguished by having a happy ending (this being considered for a long time the essential difference), by quaint situations, and by lightness of dialogue and character-drawing. As compared with farce it abstains from crude and boisterous jesting, and is marked by some subtilty of dialogue and plot. It is, however, difficult to draw a hard and fast line of demarcation, there being a distinct tendency to combine the characteristics of farce with those of true comedy. This is perhaps more especially the case in the so-called “musical comedy,” which became popular in Great Britain and America in the later 19th century, where true comedy is frequently subservient to broad farce and spectacular effects.

The word “comedy” is derived from the Gr. κωμῳδία, which is a compound either of κώμος, revel, and άδοξος, singer; also, άδειος, to sing, or of κώμος, village and άδοξος: it is possible that κώμος itself is derived from χωμ-, and originally meant a village revel. The word comes into modern usage through the Lat. comedia and Ital. commedia. It has passed through various shades of meaning. In the middle ages it meant simply a story with a happy ending. Thus some of Chaucer’s Tales are called comedies, and in this sense Dante used the term in the title of his poem, La Commedia (cf. his Epistola X., in which he speaks of the comic style as “loquitos vulgaris, in qua et muliericiu communicat”), again “comedia vero remissae et humiliter;” “differt a tragedia per hoc, quod t. in principio est admirabilis et quieta, in fine sive exitu est foetida et horribilis.” Subsequently the term is applied to mystery plays with a happy ending. The modern usage combines this sense with that in which Renaissance scholars applied it to the ancient comedies.

The adjective “comic” (Gr. κωμῳδικός), which strictly means that which relates to comedy, is in modern usage generally confined to the sense of “laughter-provoking”; it is distinguished from “humorous” or “witty” inasmuch as it is applied to an incident or remark which provokes spontaneous laughter without a special mental effort. The phenomena connected with laughter and that which provokes it, the comic, have been carefully investigated by psychologists, in contrast with other phenomena connected with the emotions. It is very generally agreed that the predominate characteristics are incongruity or contrast in the object, and shock or emotional seizure on the part of the subject. It has also been held that the feeling of superiority is an essential, if not the essential, factor: thus Hobbes speaks of laughter as a “sudden glory.” Physiological explanations have been given by Kant, Spencer and Darwin. Modern investigators have paid much attention to the origin both of laughter and of smiling, babies being watched from infancy and the date of their first smile being carefully recorded. For an admirable analysis and account of the theories see James Sully, On Laughter (1902), who deals generally with the development of the “play instinct” and its emotional expression.

See Drama; also Humor; Caricature; Play, &c.

**COMENIUS** (or KOMENSKY), JOHANN AMOS (1592–1671), a famous writer on education, and the last bishop of the old church of the Moravian and Bohemian Brethren, was born at Comna, or, according to another account, at Niwitz, in Moravia, of poor parents belonging to the sect of the Moravian Brethren. Having studied at Herborn and Heidelberg, and travelled in Holland and England, he became rector of a school at Prenau, and after that pastor and rector of a school at Fulnek. In 1621 the Spanish invasion and persecution of the Protestants robbed him of all he possessed, and drove him into Poland. Soon after he was made bishop of the church of the Brethren. He supported himself by teaching Latin at Lissa, and it was here that he published his Pansophiae prodromus (1630), a work on education, and Janua linguarum rerum (1631), the latter of which gained for him a widespread reputation, being produced in twelve European languages, and also in Arabic, Persian and Turkish. He subsequently published several other works of a similar kind, as the Eruditionis scholasticae Janus and the Janua linguarum triungulae. His method of teaching languages, which he seems to have been the first to adopt, consisted in giving, in parallel columns, sentences conveying useful information, in the vernacular and the languages intended to be taught (i.e. in Comenius's works, Latin and sometimes Greek). In some of his books, as the Orbis sensualium pictus (1658), pictures are added; this work is, indeed, the first children’s picture-book. In 1698 Comenius was requested by the government of Sweden to draw up a scheme for the management of the schools of that country; and a few years after he was invited to join the commission that the English parliament then intended to appoint, in order to reform the system of education. He visited England in 1641, but the disturbed state of politics prevented the appointment of the commission, and Comenius passed over to Sweden in August 1642. The great Swedish minister, Oxenstjerna, obtained for him a pension, and a commission to furnish a plan for regulating the Swedish schools according to his own method. Devoting himself to the elaboration of his scheme, Comenius settled first at Elbing, and then at Lissa; but, at the burning of the latter city by the Poles, he lost nearly all his manuscripts, and he finally removed to Amsterdam, where he died in 1671.

As an educator, Comenius holds a prominent place in history. He was disgusted at the pedantic teaching of his own day, and he insisted that the teaching of words and things must go together. Languages should be taught, like the mother tongue, by conversation on ordinary topics; pictures, object lessons, should be used; teaching should go hand in hand with a happy life. In his course he included singing, economy, politics, world-history, geography, and the arts and handicrafts. He was one of the first to advocate teaching science in schools.

As a theologian, Comenius was greatly influenced by Boehme. In his Synopsis physicae ad lumen divinum reformatae he gives a physical theory of his own, said to be taken from the book of Genesis. He was also famous for his prophecies and the support he gave to visionaries. In his Lectura Hermeneutica he published the visions of Kotterus, Dabrius and Christina Pontiova. Attempting to interpret the book of Revelation, he promised the millennium in 1672, and guaranteed miraculous assistance to those who would undertake the destruction of the Pope and the house of Austria, even venturing to prophesy that Cromwell, Gustavus Adolphus, and Rakoczky, prince of Transylvania, would perform the task. He also wrote to Louis XIV., informing him that the empire of the world should be his reward if he would overthrow the enemies of God.

Comenius also wrote against the Socinians, and published three historical works—Ratio disciplinae ordinis et in unilate fratrum comitis—of which the third work (1648), Historia persecutionum ecclesiae Bohemicae, and Martyrologium Bohemicum. See Raumer’s Geschichte der Pädogogik, and Carpzov’s Religionsuntersuchung der böhmischen und mährischen Brethren.
from the arc of a parabola. An obvious but not sharp classification of comets is into bright comets visible to the naked eye, and telescopic comets which can be seen only with a telescope. The telescopic class is much the more numerous of the two, only from 20 to 30 bright comets usually appearing in any one century, while several telescopic comets, frequently 6 or 8, are generally observed in the course of a year.

A bright comet consists of (1) a star-like nucleus; (2) a nebulous haze, called the coma, surrounding this nucleus, the latter fading into the haze by insensible gradations; (3) a tail or luminous stream flowing from the coma in a direction opposite to that of the sun. The nuclei and comae of different comets exhibit few peculiarities to the unaided vision except in respect to brightness; but the tails of comets differ widely, both in brightness and in extent. They range from a barely visible brush or feather of light to a phenomenon extending over a considerable arc of the heavens, which, comparatively bright near the head of the comet, becomes gradually fainter and more diffuse towards its end, fading out by gradations so insensible that a precise length cannot be assigned to it. When a telescopic comet is first discovered the nucleus is frequently invisible, the observer seeing only a faint nebulous haze, scarcely distinguishable in aspect from a nebula. When the nucleus appears it may at first be only a comparatively faint condensation, and may or may not develop into a point of light as the comet approaches the sun. A tail also is generally not seen at great distances from the sun, but gradually develops as the comet approaches perihelion, to fade away again as the comet recedes from the sun.

A few comets are known to revolve in orbits with a regular period, while, in the case of others, no evidence is afforded by observation that the orbit deviates from a parabola. Were the orbit a parabola or hyperbola the comet would never return (see Orbit). Periodicity may be recognized in two ways: observations during the apparition may show that the motion is in an elliptic and not in a parabolic orbit; or a comet may have been observed at more than one return. In the latter case the comet is recognized as distinctly periodic, and therefore a member of the solar system. The shortest periods range between 3 and 10 years. The majority of comets which have been observed have been known as periodic, and an orbit appears to be periodic the process is usually very long, being sometimes measured by centuries, but generally by thousands of years. It is conceivable that a comet might revolve in a hyperbolic orbit. Although there are several of these bodies observations on which indicate such an orbit, the deviation from the parabolic form has not in any case been so well marked as, to be fully established. Circumstances lead to the classification of newly appearing comets as expected and unexpected. An expected comet is a periodic one of which the return is looked for at a determinate time and in a certain region of the heavens. When this is not the case the comet is an unexpected one.

Physical Constitution of Comets.—The subject of the physical constitution of these bodies is one as to the details of which much uncertainty still exists. The considerations on which conclusions in this field rest are very various, and can best be set forth by beginning with what we may consider to be the best established facts.

We must regard it as well established that comets are not like planets and satellites, permanent in mass, but are continuously losing minute portions of the matter which belongs to them, through a progressive dissipation—at least when they are in the neighbourhood of the sun. When near perihelion the matter of a comet is seen to be undergoing a process in the nature of evaporation, successive envelopes of vapour rising from the nucleus to form the coma, and then gradually repelled from the sun to form the tail. If this process went on indefinitely every comet would, in the course of ages, be entirely dissipated. This result has actually happened in the case of some known comets, the best established example of which is that of Biela, in which the process of disintegration was clearly followed. As the amount of matter lost by a comet at any one return cannot be estimated, and may be very small, it is impossible to set any limit to the period during which its life may continue. It is still an unsettled question whether, in every case, the evaporation will ultimately cease, leaving a residuum as permanent as any other mass of matter.

The next question in logical order is one of great difficulty. It is whether the nucleus of a comet is an opaque solid body, a cluster of such bodies, or a mass of particles of extreme tenuity. Some light is thrown on this and other questions by the spectroscope. This instrument shows in the spectrum of nearly every comet three bright bands, recognized as those of hydrocarbons. The obvious conclusion is that the light forming these bands is not reflected sunlight, but light radiated by the gaseous hydrocarbons. Since a gas at so great a distance from the sun cannot be heated to incandescence, the question arises how incandescence is excited. The generalizations of recent years growing out of the phenomena of radioactivity make it highly probable that the source of this band is to be found in some form of electrical excitation, produced by electrons or other corpuscles thrown out by the sun. The resemblance of the cometary spectrum to the spectrum of hydrocarbons in the Geissler tube lends great plausibility to this conclusion. It is also observed that when a comet is close to the sun it showed the bright lines of sodium with such intensity that they were observed in daylight by R. Copeland and W. O. Lohse.

In addition to these gaseous spectra, all but the fainter comets show a continuous spectrum, crossed by the Fraunhofer lines, which is doubtless due to reflected sunlight. It happens that, since the spectroscope has been perfected, no comet of great brilliancy has been favourably situated for observation. Until the opportunity is offered, the conclusions to be derived from spectroscopic observation cannot be further extended.

In the telescope the nucleus of a bright comet appears as an opaque mass, one or more seconds in diameter, the absolute dimensions comparing with those of the satellites of the planets, sometimes, indeed, equal to our moon. But the actual results of micrometric measures are found to differ very widely. In the case of Donati’s comet of 1858 the nucleus seemed to grow smaller as perihelion was approached. This is evidently due to the fact that the coma immediately around the nucleus was so bright as apparently to form a part of it at considerable distances from the sun. P. Bond estimated the diameter of the actual nucleus at 500 m. That the nucleus is a body of appreciable mass seems to be made probable by the fact that, except for the central attraction of such a body, a comet would speedily be dissipated by the different attractions of the sun on different parts of the mass, which would result in each particle pursuing an orbit of its own. It follows that there must be a mass sufficient to hold the parts of the comet, if not absolutely together, at least in each other’s immediate neighbourhood. How great a central mass may be required for this is a subject not yet investigated. It might be supposed that the amount of matter must be sufficient to make the nucleus quite opaque. But two considerations based on observations militate against this view. One is that an opaque body, reflecting much sunlight, would show a brighter continuous spectrum than has yet been found in any comet. Another and yet more remarkable observation is on record which goes far to prove not only the tenuity, but the transparency of a cometary nucleus. The great comet of 1882 made a transit over the sun on the 17th of September, an occurrence unique in the history of astronomy. But the fact of the transit escaped the observation of the Comet of the Century. Here the comet was watched by W. H. Finlay and by W. L. Elkin as it approached the sun, and was kept in sight until it came almost or quite in contact with the sun’s disk, when it disappeared. It should, if opaque, have appeared a few minutes later, projected on the sun’s disk; but not a trace of it could be seen. The sun was approaching Table Mountain at the critical moment, and its limb was undulating badly, making the detection of a minute point difficult. The possibility of a very small opaque nucleus is therefore still left open; yet the remarkable conclusion still holds that, immediately around a possible central nucleus, the matter of the head of the comet was so rare as not to intercept

COMET

any appreciable fraction of the sun's light. This result seems also to show that, with the possible exception of a very small central mass, what seems to telescopic vision as a nucleus is really only the central portion of the coma, which, as the distance from the centre increases, becomes less and less dense by imperceptible gradations.

Another fact tending towards this same conclusion is that after this comet passed perihelion it showed several nuclei following each other. Evidently the powerful attraction of the sun had separated the parts of the apparent nucleus, which were following each other in nearly the same orbit. As they could not have been completely brought together again, we may suppose that in such cases the smaller nuclei were permanently separated from the main body. In addition to this, the remarkable similarity of the orbit of this comet to that of several others indicates a group of bodies moving in nearly the same orbit.

The other members of the group were the great comets of 1843, 1880, and 1887. The former, though so bright as to be conspicuous to the naked eye, showed no nucleus whatever. The closely related orbits of the four bodies are also remarkable for approaching nearer the sun at perihelion than does the orbit of any other known comet.

All the great comets pass through the matter of the sun's corona with a velocity of more than 100 m per second without suffering any retardation. As it is beyond all reasonable probability that several independent bodies should have moved in orbits so nearly the same, the conclusion is that the comets were originally portions of one mass, which gradually separated in the course of ages by the powerful attraction of the sun as the collection successively passed the perihelion. It may be remarked that observations on the comet of 1843 seemed to show a slight ellipticity of the orbit, corresponding to a period of several centuries; but the deviation of all the orbits from a parabola is too slight to be established by observations. The periods of the comets are therefore unknown except that they must be counted by centuries and possibly by thousands of years.

Another fact which increases the complexity of the question is the well-established connexion of comets with meteoric showers. The shower of November 13-15, now known as the Leonids, which recurred for several centuries at intervals of about one third of a century, are undoubtedly due to a stream of particles left behind by a comet observed in 1866. The same is true of Biela's comet, the disintegrated particles of which give rise to the Andromedids, and probably true also of the Perseids, or August meteors, the orbits of which have a great similarity to a comet seen in 1862. The general and well-established conclusion seems to be that, in addition to the visible features of a comet, every such body is followed in its orbit by a swarm of meteoric particles which must have been gradually detached and separated from it. (See Meteor.)

The source of the repulsive force by which the matter forming the tail of a comet is driven away from the sun is another question that has not yet been decisively answered. Two causes have been suggested, of which one has only recently been brought to light. This is the repulsion of the sun's rays, a form of action the probability of which was shown by J. Clerk Maxwell in 1879, and which was experimentally established about thirty years later. The intensity of this action is a parabolic proportional to the surface presented by the particle to the rays, and therefore to the square of its diameter, while its mass, and therefore its gravitation to the sun, are proportional to the cube of the diameter. It follows that if the size and mass of a particle in space are below a certain limit, the repulsion of the rays will exceed the attraction of the sun, and the particle will be driven off into space. But, in order that this repulsive force may act, the particles, however minute they may be, must be opaque. Moreover, theory shows that there is a lower as well as an upper limit to their magnitude, and that it is only between certain definable limits of magnitude that the force acts. Conceiving the particle to be of the density of water, and considering its diameter as a diminishing variable, theory shows that the repulsion will balance gravity when the diameter has reached 0.0015 of a millimetre. As the diameter is reduced below this limit the ratio of the repulsive to the attractive force increases, but soon reaches a maximum, after which it diminishes down to a diameter of 0.005 mm., when the two actions are again balanced. Below this limit the light speedily ceases to act. It follows that a purely gaseous body, such as would emit a characteristic bright line spectrum, would not be subject to the repulsion. We must therefore conclude that both the solid and gaseous forms of matter are here at play, and this view is consonant with the fact that the comet leaves behind it particles of meteoric matter.

Another possible cause is electrical repulsion. The probability of this cause is suggested by recent discoveries in radioactivity and by the fact that the sun undoubtedly sends forth electrical emanations which may ionize the gaseous molecules rising from the nucleus, and lead to their repulsion from the sun, thus resulting in the phenomena of the tail. But well-established laws are not yet sufficiently developed to lead to definite conclusions on this point, and the question whether both causes are combined, and, if not, to which one the phenomena in question are mainly due, must be left to the future.

A curious circumstance, which may be explained by a duplex character of the matter forming a cometary tail, is the great difference between the visual and photographic images of these bodies. The soft, delicate, feathery-like form which the comet with its tail presents to the eye is wanting in a photograph, which shows principally a round head with an irregularly formed tail much like the knotted stalk of a plant. It follows that the light emitted by the central axis of the tail greatly exceeds in actinic power the diffuse light around it. A careful comparison of the form and intensity of the photographic and visual tails may throw much light on the question of the constitution of these bodies, but no good opportunity of making the comparison has been afforded since the art of celestial photography has been brought to its present state of perfection.

The main conclusion to which the preceding facts and considerations point is that the matter of a comet is partly solid and partly gaseous. The gaseous form is shown conclusively by the spectroscope, but in view of the extreme delicacy of the indications with this instrument no quantitative estimate of the gas can be made. As there is no central mass sufficient to hold together a continuous atmosphere of elastic gas of any sort, it seems probable that the gaseous molecules are only those rising from the coma, possibly by ordinary evaporation, but more probably by the action of the ultra-violet and other rays of the sun giving rise to an ionization of disconnected gaseous molecules. The matter cannot be wholly gaseous because in this case there could be no central force sufficient to keep the parts of the comet together.

The facts also point to the conclusion that the solid matter of a comet is formed of a swarm or cloud of small disconnected masses, probably having much resemblance to the meteoric masses which are known to be flying through the solar system and possibly of the same general kind as these. The question whether there is any central solid of considerable mass is still undecided; it can only be said that if so, it is probably small relative to cosmic masses in general—more likely less than one hundred in diameter. The light of the comet therefore proceeds from the sun, which the incandescence of gases, the other the sunlight reflected from the solid parts. No escape can be formed of the ratio between these two kinds of light until a bright comet shall be spectroscopically observed during an entire apparition.

Origin and Orbits of Comets.—The great difference which we have pointed out between comets and the permanent bodies of the solar system naturally suggested the idea that these bodies do not belong to that system at all, but are nebulous masses, scattered through the stellar spaces, and brought one by one into the sphere of the sun's attraction. The results of this view are easily shown to be incompatible with the observed facts. The sun, carrying the whole solar system with it, is moving through space with a speed of about 10 m per second. If it approached a comet nearly at rest the result would be a relative motion of this amount which, as the comet came nearer,
would be constantly increased, and would result in the comet describing relative to the sun a markedly hyperbolic orbit, deviating too widely from a parabola to leave any doubt, even in the most extreme cases. Moreover, a large majority of comets would then have their aphelia in the direction of the sun's motion, and therefore their perihelia in the opposite direction. Neither of these results corresponds to the fact. The conclusion is that if we regard a comet as a body not belonging to the solar system, it is at least a body which before its approach to the sun had the same motion through the stellar spaces that the sun has. As this unity of motion must have been maintained from the beginning, we may regard comets as belonging to the solar system in the sense of not being visitors from distant regions of space.

The acceptance of this seemingly inevitable conclusion leads to another: that no comet yet known moves in a really hyperbolic orbit, but that the limit of eccentricity must be regarded as 1, or that of the parabola. It is true that seeming evidence of hyperbolic eccentricity is sometimes afforded by observations and regarded by some astronomers as sufficient. The objections to the reality of the hyperbolic orbit are two. (1) A comet moving in a decidedly hyperbolic orbit must have come from so great a distance within a finite time, say a few millions of years, as to have no relation to the sun, and must after its approach to the sun return into space, never again to visit our system. In this case the motion of the sun through space renders it almost infinitely improbable that the orbit would have been so nearly a parabola as all such orbits are actually found to be. (2) The apparent deviation from a very elongated ellipse has never been in any case greater than might have been the result of errors of observation on bodies of this class.

This being granted, a luminous view of the causes which lead to the observed orbits of comets is readily gained by imagining these bodies to be formed of nebulous masses, which originally accompanied the sun in its journey through space, but at distances, in most cases, vastly greater than that of the farthest planet. Such a mass, when drawn towards the sun, would move round it in a nearly parabolic orbit, similar to the actual orbits of the great majority of comets. The period might be measured by thousands, tens of thousands, or hundreds of thousands of years, according to the distances of the comet in the beginning; but instead of bodies extraneous to the system, we should have bodies properly belonging to the system and making revolutions around the sun.

Were it not for the effect of planetary attraction long periods like these would be the general rule, though not necessarily universal. But at every return to perihelion the motion of a comet will be to some extent either accelerated or retarded by the action of Jupiter or any other planet in the neighbourhood of which it may pass. Commonly the action will be so slight as to have little influence on the orbit and the time of revolution. But should the comet chance to pass the orbit of Jupiter just in front of the planet, its motion would be retarded and the orbit would be changed into one of shorter period. Should it pass behind the planet, its motion would be accelerated and its period lengthened. In such cases the orbit might be changed to a hyperbola, and then the comet would never return. It follows that there is a tendency towards a gradual but constant diminution in the total number of comets. If we call Δε the amount by which the eccentricity of a cometary orbit is less than unity, Δε will be an extremely minute fraction in the case of the original orbits. If we call ±δ the change which the eccentricity ε − Δε undergoes by the action of the planets during the passage of the comet through our system, it will leave the system with the eccentricity ε − Δε ± δ. The possibilities are even whether δ shall be positive or negative. If negative, the eccentricity will be diminished and the period shortened. If positive, and greater than Δε, the eccentricity ε − Δε + δ will be greater than 1, and then the comet will be thrown into a hyperbolic orbit and become for ever a wanderer through the stellar spaces.

The nearer a comet passes to a planet, especially to Jupiter, the greatest planet, the greater δ may be. If δ is a considerable negative fraction, the eccentricity will be so reduced that the comet will after the approach be one of short period. It follows that, however long the period of a comet may be, there is a possibility of its becoming one of short period if it approaches Jupiter. There have been several cases of this during the past two centuries, the most recent being that of Brooks's comet, 1859, V. Soon after its discovery this body was found to have a period of only about seven years. The question why it had not been observed at previous returns was settled after the orbit had been determined by computing its motion in the past.

It was thus found that in October 1886 the comet had passed in the immediate neighbourhood of Jupiter, the action of which had been such as to change its orbit from one of long period to the short observed period. A similar case was that of Lexell's comet, seen in 1770. Originally moving in an unknown orbit, it encountered the planet Jupiter, made two revolutions round the sun, in the second of which it was observed, then again encountered the planet, to be thrown out of its orbit into one which did not admit of determination. The comet was never again found.

A general conclusion which seems to follow from these conditions, and is justified by observations, so far as the latter go, is that comets are not to be regarded as permanent bodies like the planets, but that the conglomerations of matter which compose them are undergoing a process of gradual dissipation in space. This process is especially rapid in the case of the fainter periodic comets. It was first strikingly brought out in the case of Biela's comet. This object was discovered in 1772, was observed to be periodic after several revolutions had been made, and was observed with a fair degree of regularity at different returns until 1852. At the previous apparition it was found to have separated into two masses, and in 1852 these masses were so widely separated that they might be considered as forming two comets. Notwithstanding careful search at times and places when the comet was due, no trace of it has since been seen. An examination of the table of periodic comets given at the end of this article will show that the same thing is probably true of several other comets, especially Brossen's and Tempel's, which have each made several revolutions since last observed, and have been sought for in vain.

In view of the seemingly inevitable dissipation of comets in the course of ages, and of the actually observed changes of their orbits by the attraction of Jupiter, the question arises whether the orbits of all comets of short period may not have been determined by the attraction of the planets, especially of Jupiter. In this case the orbit would, for a period of several centuries, have continued to nearly intersect that of the planet. We find, as a matter of fact, that several periodic comets either pass near Jupiter or have their aphelia in the neighbourhood of the orbit of Jupiter. The approach, however, is not sufficiently close to have led to the change unless in former times the proximity of the orbits was much greater than it is now. As the orbits of all the bodies of the solar system are subject to a slow secular change of their form and position, this may only show that it must have happened hundreds of years ago when the comets were of very short period. The two cases of most difficulty are those of Halley's and Encke's comets. The orbit of the former is so elongated and so inclined to the general plane of the planetary orbits that its secular variation must be very slow indeed. But it does not pass near the orbit of any planet except Venus; and even here the proximity is far from being sufficient to have produced an appreciable change in the period. The orbit of Encke's comet is entirely within the orbit of Jupiter, and it also cannot have passed near enough to a planet for thousands of years to have had its orbit changed by the action in question. It therefore seems difficult to regard these two comets as other than permanent members of the solar system.

Special Periodic Comets.—One of the most remarkable periodic comets with which we are acquainted is that known to astronomers as Halley's. Having perceived that the elements of the comet of 1682 were nearly the same as those of two comets which had respectively appeared in 1531 and 1607, Edmund
Halley concluded that all the three orbits belonged to the same comet, of which the periodic time was about 76 years. After a rough estimate of the perturbations it must sustain from the attraction of the planets, he predicted its return for 1757, a bold prediction at that time, but justified by the event, for the comet again made its appearance as was expected, though it did not pass through its perihelion till the month of March 1759, the attraction of Jupiter and Saturn having caused, as was computed by Clairaut previously to its return, a retardation of 618 days. This comet had been observed in 1066, and the accounts which have been preserved represent it as having then appeared to be four times the size of Venus, and to have shone with a light equal to a fourth of that of the moon. History is silent respecting it from that time till the year 1456, when it passed very near to the earth: its tail then extended over 60° of the heavens, and had the form of a sabre. It returned to its perihelion in 1835, and was well observed in almost every observatory. But its brightness was far from comparing with the glorious accounts of its former apparitions. That this should have been due to the process of dissipation does not seem possible in so short a period; we must therefore consider either that the earlier accounts are exaggerated, or that the brightness of the comet is subject to changes from some unknown cause. Previous appearances of Halley's comet have been calculated by J. R. Hiad, and more recently by P. H. Cowell and A. C. D. Crommelin of Greenwich, the latter having carried the comet back to 87 B.C. with certainty, and to 240 B.C. with fair probability. It was detected by Max Wolf at Heidelberg on plates exposed on Sept. 11, 1909, and subsequently on a Greenwich plate of Sept. 9.

The comet of shortest period bears the name of J. F. Encke, the astronomer who first investigated its orbit and showed its periodicity. It was originally discovered in 1786, but its periodicity was not recognized until 1818, after it had been observed at several returns. This comet has given rise to a longer series of investigations than any other, owing to Encke's result that the orbit was becoming smaller, and the revolutions therefore accelerated, by some unknown cause, of which the most plausible was a resisting medium surrounding the sun. As this comet is almost the only one that passes within the orbit of Mercury, it is quite possible that it alone would show the effect of such a medium. Recent investigations of this subject have been made at the Pulkova observatory, first by F. E. von Asten, and later by J. O. Backlund who, in 1909, was awarded the Gold Medal of the Royal Astronomical Society for his researches in this field. During some revolutions there was evidence of a slight acceleration of the return, and during others there was not.

The following is a list (compiled in 1909) of comets which are well established as periodic, through having been observed at least once or more returns. In addition to what has already been said of several comets in this list the following remarks may be made.

**COMET-SEEKER—COMITIA**

When the resemblance of the two orbits led to the conclusion of the identity of the bodies, the period of which was soon made evident by continued observations. The comets of Pons and Olbers are remarkable for having an almost equal period. But their orbits are otherwise totally different, so that there does not seem to be any connexion between them. Bronsen's comet seems also to be completely dissipated, not having been seen since 1789.

There are also a number of cases in which a comet has been observed through one apparition, and which was not seen to return at the end of its supposed period. In some of these cases it seems likely that the comet passed near the planet Jupiter and thus had its orbit entirely changed. It is possible that in other cases the apparent periodicity is due to the unavoidable errors of observation to which, owing to their diffused outline, the nuclei of comets are liable.

**COMET-SEEKER,** a small telescope (q.v.) adapted especially for searching to comets: commonly of short focus length and large aperture, in order to secure the greatest brilliancy of light.

**COMILLA,** a town of British India, headquarters of the Tippera district in Eastern Bengal and Assam, situated on the river Gumti, with a station on the Assam-Bengal railway, 90 m. from the coast terminus at Chittagong. Pop. (1901) 17,149. The town has many large tanks and an English church, built in 1875.

**COMINES,** or **COMINES** (Flem. **Komen**), a town of western Flanders, 13 m. N.N.W. of Lille by rail. It is divided by the river Lys, leaving one part on French (department of Nord), the other on Belgian territory (province of West Flanders). Pop. of the French town 6359 (1906); of the Belgian town, 6453 (1904). The former has a belfry of the 14th century, restored in the 17th and 19th centuries, and remains of a château. Comines carries on the spinning of flax, wool and cotton.

**COMITIA,** the name applied, always in technical and generally in popular phraseology, to the most frequent type of gathering of the sovereign people in ancient Rome. It is the plural of *comitium*, the old "meeting-place" (Lat. *sum*, together, *ire*, to go) on the north-west of the Forum. The Romans had three words for describing gatherings of the people. These were *concilium*, *comitia* and *contio*. Of these *concilium* had the most general significance, and could be distinguished from *comitia* by the addition of the word *comitia*. But *comitia* was often used to describe assemblies in foreign states. Hence, therefore, a word that might be employed to denote an organized gathering of a portion of the Roman people such as the plebs, and in this sense is contrasted with *comitia*, which when used strictly should signify an assembly of the whole people. Thus the Roman draughtsman who wishes to express the idea "magistrates of any kind as president of assemblies" writes "*Magistratus quequecumque comitia conciliumve habeit*" (*Lex Latina tabulae Bantiniae*, I. 5), and formalism required that a magistrate who summoned only a portion of the people to meet should, in his summons, use the word *concilium*. This is said by Lælius Felix, a lawyer probably of the age of Hadrian, when he writes "Is qui non universum populum, sed partem aliquam adesse jubet, non comitia, sed concilium edicere debet" (*Gellius*, *Notices Attic*, xx. 27). But this procedure, however convenient and simple, did not conform to this canon, and *comitia*, which gained in current Latin the sense of "elections" was sometimes used of the assemblies of the plebs (see the instances in Botsford, distinction between *Comitia* and *Concilium*, p. 23). The distinction between *comitia* and *contio* was more clearly marked. Both were formal assemblies convened by a magistrate; but while, in the case of the *comitia*, the magistrate's purpose was to ask a question of the people and to elicit their binding response, his object in summoning a *contio* was merely to bring the people together either

COMITIA

for their instruction or for a declaration of his will as expressed in an edict ("contulit habere est verba facere ad populum sine ullo rogatione.") Gell. op. cit. xiii. 6). The word comitia merely means "meetings."

The earliest comitia was one organized on the basis of parishes (curiae) and known in later times as the comitia curiata. The curia voted as a single unit and thus furnished the type for that system of group-voting which runs through all the later organization of the popular assembles. This comitia must originally have been composed exclusively of patricians (q.v.); but there is reason to believe that, at an early period of the Republic, it had, in imitation of the centuriae organization, come to include plebeians (see CURIA). The organization which gave rise to the comitia centuriata was the result of the earliest steps in the political emancipation of the plebs. Three stages in this process may be conjectured. In the first place the plebeians gained full rights of ownership and transfer, and could thus become freeholders of the land which they occupied and of the appurtenances of this land (res mancipii). This legal capacity rendered them liable to military service as heavy-armed fighting men, and as such they were enrolled in the military units called centuriae. When the enrolment was completed the whole host (exercitus) was the best organized and most representative gathering in Italy. The show was that therefore either they or became gradually invested with voting powers, and gained a range of power which for two centuries (308-287 B.C.) made it the dominant assembly in the state. But its aristocratic organization, based as this was on property qualifications which gave the greatest voting power to the richest men, prevented it from being a fitting channel for the expression of plebeian claims. Hence the plebeans adopted a new political organization of their own. The tribune called into existence a purely plebeian assembly, firstly, for the election of plebeian magistrates; secondly, for jurisdiction in cases where these magistrates had been injured; thirdly, for presenting petitions on behalf of the plebs through the consuls to the comitia centuriata. This right of petitioning developed into a power of legislation. The stages of the process (marked by the Valerio-Erastian laws of 449 B.C., the Publilian law of 339 B.C., and the Hortensian law of 287 B.C.) are unknown; but it is probable that the two first of the laws progressively weakened the discretionary power of senate and consuls in admitting such petitions; and that the Hortensian law fully recognized the right of the plebs (plebeians) through plebiscitum to forestall the comitia centuriata. The plebeian assembly, which had perhaps originally met by curiae, was organized on the basis of the territorial tribes in 471 B.C. This change suggested a renewed organization of the whole people for comital purposes. The comitia tributa populi was the result. This assembly seems to have been already in existence at the epoch of the Twelve Tables in 451 B.C., its electoral activity is perhaps attested in 447 B.C., and it appears as a legislative body in 357 B.C.

In spite of the formal differences of these four assemblies and the real distinction springing from the fact that patriots were not members of the plebeian bodies, the view which is appropriate to the developed Roman constitution is that the people expressed its will equally through all, although the mode of expression varied with the channel. This will was in theory unlimited. It was restricted only by the conservatism of the Roman, by the condition that the initiative must always be taken by a magistrate, by the de facto authority of the senate, and by the magisterial veto which the senate often had at its command (see SENATE). There were no limitations on the legislative powers of the comitia except such as they chose to impose on themselves, and the majority prevailed. They never during the Republican period lost the right of criminal jurisdiction, in spite of the fact that so many spheres of this jurisdiction had been assigned in perpetuity to standing commissions (quaestiones perpetuae). This power of judging exercised by the assemblies had in the main developed from the use of the right of appeal (provocatio) against the judgments of the magistrates. But it is probable that, in the developed procedure, where it was known that the judgment pronounced might legally give rise to the appeal, the magistrate pronounced no sentence, but brought the case at once before the people. The case was then heard in four separate contiones. After these hearings the comitia gave its verdict. Finally, the people elected to every magistracy with the exception of the occasional offices of Dictator and Interrex. The distribution of these functions amongst the various comitia, and the differences in their organization, were as follows:

The comitia curiata had in the later Republic become a merely formal assembly. Its main function was that of passing the lex curiata which was necessary for the ratification both of the imperium of the higher magistrates of the people, and of the potestas of those of lower rank. This assembly also met, under the name of the comitia calata and under the presidency of the pontifex maximus, for certain religious acts. These were the inauguration of the rex sacrorum and the flamen; and that abjuration of hereditary worship (detestatio sacrorum) which was made by a man who passed from his clan (gens) either by an act of adrogation (see ROMAN LAW and ADOPTION) or by transition from the patron to the plebeian order. For the purpose of passing the lex curiata, and probably for its other purposes as well, this comitia was in Cicero's day represented by thirty lictors (Cic. de Leg. Agr., ii. 12, 31).

The comitia centuriata could be summoned and presided over only by the two consuls. The comitia curiata, and the consuls, and alone had the power of declaring war. According to the principle laid down in the Twelve Tables (Cicero, de Legibus, iii. 4. 11) capital cases were reserved for this assembly. It was not frequently employed as a legislative body after the two assemblies of the tribes, which were easier to summon and organize, had been recognized as possessing sovereign rights. The internal structure of the comitia centuriata underwent a great change during the Republic—a change which has been conjecturally attributed to the censorship of Flaminius in 220 B.C. (Mommsen, Staatsrecht, iii. p. 270). In the early scheme, at a time when a pecuniary valuation had replaced land and its appurtenances (res mancipi) as the basis of qualification, five divisions (classes) were recognized whose property was assessed respectively at 100,000, 75,000, 50,000, 25,000, and 11,000 (or 12,500) asses. The first class contained 80 centuries; the second, third and fourth 70; the fifth 58. Added to these were the 18 centuries of knights (see EQUITES). The composition of the first class and the knights was thus represented by 98 centuries; that of the whole of the other classes (including 4 or 5 centuries of professional corporations connected with the army, such as the fabri and 1 century of proletarii, i.e., of all persons below the minimum census) was represented by 95 or 96 centuries. Thus the upper classes in the community possessed more than half the votes in the assembly. The newer scheme aimed at a greater equality of voting power; but it has been differently interpreted. The interpretation most usually accepted, which was first suggested by Pantagathus, a 17th-century scholar, is based on the view that the five classes were distributed over the tribes in such a manner that there were 2 centuries of each class in a single tribe. As the number of the tribes was 35, the total number of centuries would be 350. To these we must add 18 centuries of knights, 4 of fabri, &c., and 1 of proletarii. Here the first class and the knights command but 88 votes out of a total of 373. Mommsen's interpretation (Staatsrecht, iii. p. 257) was different. He allowed the 70 votes for the 70 centuries of the first class, but thought that the 290 centuries of the other classes were so combined as to form only 100 votes. Thus the total votes in the comitia would be 70+100+5 (fabri, &c.)+18 (knights), i.e., 193, as in the earlier arrangement. In 88 B.C. a return was made to the original and more aristocratic system by a law passed by the consuls Sulla and Pompeius. At least this seems to be the meaning of Appian (Bellum Civil. i. 59) when he says συναγωγή... τὰς χωρονοσίας μὴ κατὰ φυλᾶς άλλα κατὰ λόγους... χίλιοια. But this change was not permanent as the more liberal system prevails in the Ciceronian period.
The *comitia tributa* was in the later Republic the usual organ for laws passed by the whole people. Its presidents were the magistrates of the people, usually the consuls and praetors, and, for purposes of jurisdiction, the curule aediles. It elected these aediles and other lower magistrates of the people. Its jurisdiction was limited to monetary penalties.

The *concilium plebis*, although voting, like this last assembly, by tribes, could be summoned and presided over only by plebeian magistrates, and never included the patricians. Its utterances (*plebiscita*) had the full force of law; it elected the tribunes of the plebs and the plebeian aediles, and it pronounced judgment on the penalties which they proposed. The right of this assembly to exercise capital jurisdiction was questioned; but it possessed the undisputed right of pronouncing outlawry (*aquae et ignis interdictio*) against any one already in exile (Livy xxv. 4, and xxvi. 3).

When the tenure of the religious colleges—formerly filled up by co-optation—was submitted to popular election, a change effected by a *lex Domitia* of 104 B.C., a new type of *comitia* was devised for this purpose. The electoral body was composed of 17 tribes selected by lot from the whole body of 35.

There was a body of rules governing the *comitia* which were concerned with the time and place of meeting, the forms of promulgating the sense. The methods of voting. This might be held on any of the 104 "comital" days of the year which were not market or festival days (*nundinae, feriae*). The *comitia curiata* and the two assemblies of the tribes met within the walls, the former usually in the Comitium, the latter in the Forum or on the Area Capitolii; but the elections at these assemblies were in the later Republic held in the Campus Martius outside the walls. The *comitia centuriata* was by law compelled to meet outside the city and its gathering place was usually the Campus. Promulgation was required for the space of 3 *nundinae* (i.e. 24 days) before a matter was submitted to the people. The voting was preceded by a *contio* at which a limited debate was permitted by the magistrates. In the assemblies of the *curiae* and the tribes the voting of the groups took place simultaneously, in that of the centuries in a fixed order. In elections as well as in legislative acts an absolute majority was required, and hence the candidate who gained a mere relative majority was not returned.

The *comitia* survived the Republic. The last known act of comital legislation belongs to the reign of Nerva (*A.D.* 96–98). After the essential elements in the election of magistrates had passed to the senate in *A.D.* 14, the formal announcement of the successful election (*renuntiatio*) came to be made to the popular assemblies. Early in the 3rd century Dio Cassius still saw the *comitia centuriata* meeting with all its old solemnities (Dio Cassius lviii. 20).

**COMITY** (from the Lat. *comites*, courtesy, from *cemic*, friendly, courteous), friendly or courteous behaviour; a term particularly used in international law, in the phrase "comity of nations," for the courtesy of nations towards each other. This has been held by some authorities to be the basis for the recognition by courts of law of the judgments and rules of law of foreign tribunals (see International Law, Private). "Comity of nations" is sometimes wrongly used, from a confusion with the Latin *comes*, a companion, for the whole body or company of nations practising such international courtesy (Heidelberg, 1888;). Comma, *Gr. κώμα*, a thing stamped or cut off, *from κόπτω*, to strike, originally, in Greek rhetoric, a short clause, something less than the "colon," hence a mark (.), in punctuation, to show the smallest break in the construction of a sentence. The mark is also used to separate numerals, mathematical symbols and the like. Inverted commas, or "quotation-marks," i.e. pairs of commas, the first inverted, and the last upright, are placed at the beginning and end of a sentence or word quoted, or of a word used in a technical or conventional sense; single commas are similarly used for quotations within quotations. The word is also applied to comma-shaped objects, such as the "comma-bacillus," the causative agent in cholera.

**COMMANDER** (from the South African Dutch *kommander*, to command), properly, to compel the performance of military duty in the field, especially of the military service of the Boer republics (see Commando); also to seize property for military purposes; hence used of any peremptory seizure for other than military purposes.

**COMMANDER**, in the British navy, the title of the second grade of captains. He commands a small vessel, or is second in command of a large one. A staff commander is entrusted with the navigation of a large ship, and ranks above a navigating lieutenant. Since 1838 the officer next in rank to a captain in the U.S. navy has been called commander.

**COMMANDERY** (through the Fr. *commanderie*, from med. Lat. *commendatoria*, a trust or charge), a division of the landed property in Europe of the Knights Hospitalers (see St John of Jerusalem). The property of the order was divided into "priorates," "eirens," "bailliwick," which in turn were of two kinds—"commanderies" or "fiefs," these were placed in charge of a "commander" or commander. The word is also applied to the emoluments granted to a commander of a military order of knights.

**COMMANDO**, a Portuguese word meaning "command," adopted by the Boers in South Africa through whom it has come into English use, for military and semi-military expeditions against the natives. More particularly a "commando" was the administrative and tactical unit of the forces of the former Boer republics, "commandeered" under the law of the constitutions which made military service obligatory on all males between the ages of sixteen and sixty. Each "commando" was formed from the burghers of military age of an electoral district.

**COMMEMORATION**, a general term for celebrating some past event. It is also the name for the annual act, or *Encaenia*, the ceremonial closing of the academic year at Oxford University. It consists of a Latin oration in commemoration of benefactors and founders; of the recitation of prize compositions in prose and verse, and the conferring of honorary degrees upon English or foreign celebrities. The ceremony, which is usually on the third Wednesday after Trinity Sunday, is held in the Sheldonian Theatre on the second or third day of "Commemoration," the term used for the equivalent ceremony at Cambridge, and this is also used in the case of American universities.

**COMMENDATION** (from the Lat. *commendare*, to entrust to the charge of, or to procure a favour for), approval, especially when expressed to one person on behalf of another, a recommendation. The word is used in a liturgical sense for an office commending the souls of the dying and dead to the mercies of God. In feudal law the term is applied to the practice of a freeman placing himself under the protection of a lord (see Feudalism), and in ecclesiastical law to the granting of benefices in commendam. A benefice was held in commendam when granted either temporarily until a vacancy was filled up, or to a layman, or, in case of a monaster or abbey, to a secular cleric to enjoy the revenues and privileges for life (see Abbey), or to a bishop to hold together with his see. An act of 1836 prohibited the holding of benefices in commendam in England.

**COMMENTS** (Lat. = Gr. *διαβούλημα*), notes to assist the memory, memoranda. This original idea of the word gave rise to a variety of meanings: notes and abstracts of speeches for the assistance of orators; family memorials, the origin of many of the legends introduced into early Roman history from a desire to glorify a particular family; diaries of events occurring in their own circle kept by private individuals,—the day-book, drawn up for Trimalchio in Petronius (Satyricon, 53) by his *actarius* (a slave to whom the duty was specially assigned) is quoted as an example; memoirs of events in which they had taken part drawn up by public men,—such were the "Commentaries" of Caesar on the
Gallic and Civil wars, and of Cicero on his consulship. Different departments of the imperial administration and certain high functionaries kept records, which were under the charge of an official known as a commentarius (cf. a secretis, ab epistulis). Municipal authorities also kept a register of their official acts.

The Commentarii Principis were the register of the official acts of the emperor. They contained the decisions, favourable or unfavourable, in regard to certain citizens; accusations brought before him or ordered by him; lists of persons in receipt of special privileges. These must be distinguished from the commentarii diurni, a daily court-journal. At a later period records called ephemerides were kept by order of the emperor; these were much used by the Scriptores Historiae Augustae (see Augustan History). The Commentarii Senatus, only once mentioned (Tacitus, Annals, xv. 74) are probably identical with the Acta Senatus (q.e.). There were also Commentarii of the priestly colleges: (a) Pontificum, collections of their decrees and responses for future reference, to be distinguished from their Annales, which were historical records, and from their Acta, minutes of their meetings; (b) Augurium, similar collections of augural decrees and responses; (c) Decemvirorum; (d) Praetorium Arnulvum. Like the priests, the magistrates also had similar manuals of their previous decisions; and these records, which were under the charge of an official known as a commentarius, were the subject. But practically nothing is known of these Commentarii Magistratuum. Mention should also be made of the Commentarii Regum, containing decrees concerning the functions and privileges of the kings, and forming a record of the acts of the king in his capacity of priest. They were drawn up in historical times like the so-called leges regiae (jus Papiriani), supposed to contain the decrees and decisions of the Roman kings.

See the exhaustive article by A. von Premerstein in Pauly-Wissowa, Realencyclopadie (1901); Teuffel-Schwabe, Hist. of Roman Lit. (Eng. trans.), pp. 72, 77-79; and the concise account by H. Théodet in Daremberg and Saglio, Dictionnaire des antiquités.

COMMENTARY, a town of central France, in the department of Allier, 42 m. S.W. of Moulins by the Orléans railway. Pop. (1906) 7,587. Commentary gives its name to a coalfield over 5000 acres in extent, and has important foundries and forges.

COMMERCY (Lat. commercium, from cum, together, and mers, merchandise), in its general acceptance, the international traffic in goods, or what constitutes the foreign trade of all nations; it is distinct from their domestic records of which they formed the subject. But practically nothing is known of these Commentarii Magistratuum. Mention should also be made of the Commentarii Regum, containing decrees concerning the functions and privileges of the kings, and forming a record of the acts of the king in his capacity of priest. They were drawn up in historical times like the so-called leges regiae (jus Papiriani), supposed to contain the decrees and decisions of the Roman kings.

In tracing the history of such dealings we may go back to the early records found in the Hebrew Scriptures. Such a transaction as that of Abraham, for example, weighing down "four hundred shekels of silver, current with the merchant," for the field of Ephron, is suggestive of a group of facts and ideas indicating an advanced condition of commercial intercourse, property in land, sale of land, arts of mining and purifying metals, the use of silver of recognized purity as a common medium of exchange, and merchandise an established profession, or division of labour. That other passage in which we read of Joseph being sold by his brethren for twenty pieces of silver to "a company of Ishmaelites, coming from Gilead, with their camels bearing spicery and balm and myrrh to Egypt," extends our vision still farther, and shows us the populous and fertile Egypt in commercial relationship with Chaldaea, and Arabs, foreign to both, as intermediaries in their traffic, generations before the Hebrew commonwealth was founded.

The first foreign merchants of whom we read, carrying goods and bars of silver from one distant region to another, were the southern Arabs, reputed descendants of Ishmael and Esau. The first notable navigators and maritime carriers of goods were the Phoenicians. In the commerce of the ante-Christian ages the Jews do not appear to have performed any conspicuous part. Both the agricultural and the theocratic constitution of their society were unfavourable to a vigorous prosecution of foreign trade. In such traffic as they had with other nations they were served on their eastern borders by Arabian merchants, and on the west and south by the Phoenician shippers. The abundance of gold, silver and other precious commodities gathered from distant parts, of which we read in the days of greatest Hebrew prosperity, has most the character of spoils of war and tributes of independent states than the conquest by free exchange of their domestic produce and manufacture. It was not until the Jews were scattered by foreign invasions, and finally cast into the world by the destruction of Jerusalem, that they began to develop those commercial qualities for which they have since been famous.

There are three conditions as essential to extensive international traffic as diversity of natural resources, division of labour, accumulation of stock, or any other primal element—(1) means of transport, (2) freedom of labour and exchange, and (3) security; and in all these conditions the ancient world was signally deficient.

The great rivers, which became the first seats of population and empire, must have been of much utility as channels of transport, and hence the course of human power of which they are the geographical delineation, and probably the idolatry with which they were sometimes honoured. Nor were the ancient rulers insensible of the importance of opening roads through their dominions, and establishing post and lines of communication, which, though primarily for official and military purposes, must have helped the national development of the population. But the free navigable area of great rivers is limited, and when diversion of traffic had to be made to roads and tracks through deserts, there remained the slow and costly carriage of burdens of burden, by which only articles of small bulk and the rarest value could be conveyed with any hope of profit. Corn, though of the first necessity, could only be thus transported in famines, when beyond price to those who were in want, and under this extreme pressure could only be drawn from within a narrow sphere, and in quantity sufficient to the sustenance of but a small number of people. The routes of ancient commerce were thus interrupted and cut asunder by barriers of travel, and the farther they were extended became the more impassable to any considerable quantity or weight of commodities. As long as navigation was confined to rivers and the shores of inland gulfs and seas, the oceans were a terra incognita, contributing nothing to the facility or security of transport from one part of the world to another, and leaving even one populous part of Asia as unapproachable from another as if they had been in different hemispheres. The various routes of trade from Europe and northern Asia to India, which have been discussed, are to be regarded more as speculations of future development than as realities of ancient history. It is not improbable that the ancient traffic of the Red Sea may have been extended along the shores of the Arabian Sea to some parts of Hindustan, but that vessels braved the Indian Ocean and passed round Cape Comorin into the Bay of Bengal, 3000 or even 4000 years before mariners had learned to double the Cape of Good Hope, is scarcely to be believed. The route by the Euxine and the Caspian Sea has probably never in any age reached India. That by the Euphrates and the Persian Gulf is shorter, and was besides the more likely from passing through tracts of country which in the most remote times were seats of great population. There may have been many merchants who traded on all these various routes, but that commodities were passed in bulk over great distances is inconceivable. It may be doubted whether in the ante-Christian ages there was any heavy transport over even 500 m., save for warlike or other purposes, which engaged the public resources of imperial states, and in which the idea of commerce, as understood, is in a great measure lost.

The advantage which absolute power gave to competitive enterprises in their warlike enterprises, and in the execution of public works of more or less utility, or of mere ostentation and monumental magnificence, was dearly purchased by the sacrifice of individual freedom, the right to labour, produce and exchange under the steady operation of natural economic principles, which more than any other cause vitalizes the individual and social energies, and multiplies the commercial resource of communities. Commerce in all periods and countries has obtained a certain freedom and hospitality from the fact that the foreign merchant has something
desirable to offer; but the action of trading is reciprocal, and requires multitudes of producers and merchants, as free agents, on both sides, searching out by patient experiment wants more advantageously supplied by exchange than by direct production, before it can attain either permanence or magnitude, or can become a vital element of national life. The ancient polities offered much resistance to this development, and in their absolute power over the liberty, industry and property of the masses of their subjects raised barriers to the extension of commerce scarcely less formidable than the want of means of communication itself. The conditions of security under which foreign trade can alone flourish equally exceed the resources of ancient civilization. Such roads as exist must be protected from robbers, the rivers and seas from pirates; goods must have safe passage and safe storage, must be held in a manner sacred in the territories through which they pass, be insured against accidents, be respected even in the madness of hostilities; the laws of nations must give a guarantee on which traders can proceed in their operations with reasonable confidence; and the governments, while protecting the commerce of their subjects with foreigners as their interests required, must maintain their fiscal policy, and in all their acts, be exuded with the highest spirit of commerce, and in honour. Every great breach of this security stops the continuous circulation, which is the life of traffic and of the industries to which it ministers. But in the ancient records we see commerce exposed to great risks, subject to constant pilage, hunted down in peace and utterly extinguished in war. Hence it became necessary that foreign trade should itself be an armed force in the world; and though the states of purely commercial origin soon fell into the same arts and wiles as the powers to which they were opposed, yet their history exhibits clearly enough the necessity out of which they arose. Once organized, it was inevitable that they should meet intrigue with intrigue, and force with force. The political empires, while but imperfectly developing industry and traffic within their own territories, had little sympathy with any means of prosperity from without. Their sole policy was either to absorb under their own spirit and conditions of rule, or to destroy, whatever was rich or great beyond their borders. Nothing is more marked in the past history of the world than this struggle of commerce to establish conditions of security and means of communication with the highest spirit of commerce. Wherever it was driven from the land, it often found both on the sea; and often, when its success had become brilliant and renowned, it perished under the assault of stronger powers, only to rise again in new centres and to find new channels of intercourse.

While Rome was giving laws and order to the half-civilized tribes of Italy, Carthage, operating on a different base, and by other methods, was opening trade with less accessible parts of Europe. The strength of Rome was in her legions, that of Carthage in her ships; and her ships could cover ground where the legions were powerless. Her mariners had passed the mythical straits into the Atlantic, and established the port of Cadiz. Within the Mediterranean itself they founded Carthagena and Barcelona on the same Iberian peninsula, and ahead of the Roman legions had depots and traders on the shores of Gaul. After the destruction of Tyre, Carthage became the greatest power in the Mediterranean, and inherited the trade of her Phoenician ancestors with Egypt, Greece and Asia Minor, as well as her own settlements in Sicily and on the European coasts. As a natural guardian of the naval and the greatest military power, whose interests crossed each other at so many points, was sure to occur; and in the three Punic wars Carthage measured her strength with that of Rome both on sea and on land with no unequal success. But a commercial state impelled into a series of great wars has departed from its own proper base; and in the year 146 B.C. Carthage was so totally destroyed by the Romans that of the great city, more than 20 m. in circumference, and containing at one period near a million of inhabitants, only a few thousands were found within its ruined walls. In the same year Corinth, one of the greatest of the Greek capitals and seaports, was captured, plundered of vast wealth and given to the flames by a Roman consul. Athens and her magnificent harbour of the Piraeus fell into the same hands 60 years later. It may be presumed that trade went on under the Roman conquerors in some degree as before; but these were grave events to occur within a brief period, and the spirit of the seat of trade in every case having been broken, and its means and resources more or less plundered and dissipated—in some cases, as that of Carthage, irreparably—the most necessary commerce could only proceed with feebly and languid interest under the military, consular and proconsular licence of Rome at that period. Tyre, the great seaport of Palestine, having been destroyed by Alexander the Great, Palmyra, the great inland centre of Syrian trade, was visited with a still more complete annihilation by the Roman Emperor Aurelian within little more than half a century after the capture and spoliation of Athens. The walls were razed to their foundations; the population—men, women, children and the rustie round the city—were all either massacred or dispersed; and the queen Zenobia was carried captive to Rome. Palmyra had for centuries, as a centre of commercial intercourse and transit, been of great service to her neighbours, east and west. In the wars of the Romans and Parthians she was respected by both powers as a focus of common interests which it would have been simple barbarity to invade or reduce; when it was finally subdued, Palmyra was subjugated, and Palmyra became a Roman annexe, she continued to flourish as before. Her relations with Rome were more than friendly; they became enthusiastic and heroic; and her citizens having inflicted signal chastisement on the king of Persia for the imprisonment of the emperor Valerian, the admiration of this conduct at Rome was so great that their spirited leader Odaenathus, the husband of Zenobia, was proclaimed Augustus, and became co-emperor with Gallienus. It is obvious that the destruction of Palmyra must not only have doomed Palestine, already bereft of her seaports, to greater poverty and commercial isolation than had been known in long preceding ages, but have also rendered it more difficult to Rome herself to hold or turn to any profitable account her conquests in Asia; and, being an example of the policy of Rome to the seats of trade over nearly the whole ancient world, it may be said to contain in graphic characters a presage of what came to be the actual event—the collapse and fall of the Roman empire itself.

The remains of the Huns and Goths were the Huns gave no rest to the Venetians in the Adriatic, which had not sunk during more than a thousand years a history of usual splendour. The Veneti cultivated fertile lands on the Po, and built several towns, of which Padua was the chief. They appear from the earliest note of them in history to have been both an agricultural and trading people; and they offered a rich prey to the barbarian hordes when these broke through every barrier into the plains of Italy. Thirty years before Attila razed the neighbouring city of Aquileia, the consuls and senate of Padua, oppressed and terrified by the prior ravages of Alaric, passed a decree for erecting Rialto, the largest of the numerous islets at the mouth of the Po, into a chief town and port, not more as a convenience to the islanders than as a security for themselves and their goods. But every fresh incursion, every new act of spoliation by the dreaded enemies, increased the flight of the rich and the industrious to the islands, and thus gradually arose the second Venice, whose glory was so greatly to exceed that of the first. Approachable from the mainland only by boats, through river-passes easily defended by practised sailors against barbarians, it had not a never plied an ear, the Venetian refugees could look in peace on the desolation which swept over Italy; their warehouses, their markets, their treasures were safe from plunder; and stretching their hands over the sea, they found in it fish and salt, and in the rich possessions of trade and territory which it opened to them more than compensation for the fat lands and inland towns which had long been their home. The Venetians traded with Constantinople, Greece, Syria and Egypt. They became lords of the Morea, and of Candia, Cyprus and other islands of the Levant. The trade of Venice with India, though spoken of, was probably never great. But the crusades of the 12th and 13th centuries against the Saracens in Palestine
extended her repute more widely east and west, and increased both her naval and her commercial resources. It is enough, indeed, to account for the grandeur of Venice that in course of centuries, from the security of her position, the growth and energy of her population, and the regularity of her government at a period when these sources of prosperity were rare, she became the great emporium of the Mediterranean—all that Carthage, Corinth and Athens had been in a former age on a scene the most remarkable in the world for its fertility and facilities of traffic,—and that as Italy and other parts of the Western empire became again more settled her commerce found always a wider range. The bridge built from the largest of the islands to the opposite bank became the “Rialto,” or famous exchange of Venice, whose transactions reached farther, and assumed a more consolidated form, than had been known before. There was where the first public bank was organized; that bills of exchange were first negotiated, and funded debt became transferable; that finance became a science and book-keeping an art. Nor must the effect of the example of Venice on other cities of Italy be left out of account. Genoa, following her steps, rose into great prosperity and power at the foot of the Maritime Alps, and became her rival, and finally, Napoleon took Genoa, and made one of the towns of Italy, and Rome herself, long after her fall, were encouraged to struggle for the preservation of their municipal freedom, and to foster trade, arts and navigation, by the brilliant success set before them on the Adriatic; but Venice, from the early start she had made, and her command of the sea, had the commercial pre-eminence.

The state of things which arose on the collapse of the Roman empire presents two concurrent facts, deeply affecting the course of trade—(1) the ancient seats of industry and civilization were undergoing constant decay, while (2) the energetic races of Europe were rising into more civilized forms and manifold vigour and copiousness of life. The fall of the Eastern division of the empire prolonged the effect of the fall of the Western empire; and the advance of the Saracens over Asia Minor, Syria, Greece, Egypt, over Cyprus and other possessions of Venice in the Mediterranean, over the richest provinces of Spain, and finally across the Hellespont into the Danubian provinces of Europe, was a new irruption of barbarians from another point of the compass, and revived the calamities and disorders inflicted by the Huns, the Avars, and Vandals of the second Roman empire on the Northern tribes. For more than ten centuries the naked power of the sword was vivid and terrible as flashes of lightning over all the seats of commerce, whether of ancient or modern origin. The feudal system of Europe, in organizing the open country under military leaders and defenders subordinated in possession and service under a legal system to each other and to the sovereign power, must have been well adapted to the necessity of the times in which it spread so rapidly; but it would be impossible to say that the feudal system was favourable to trade, or the extension of trade. The commercial spirit in the feudal, as in preceding ages, had to find for itself places of security, and it could only find them in towns, armed with powers of self-regulation and defence, and prepared, like the feudal barons themselves, to resist violence from whatever quarter it might come. Rome, in her best days, had founded the municipal system, and when this system was more than ever necessary as the bulwark of arts and manufactures, its extension became an essential element of the whole European civilization. Towns formed themselves into leagues for defensive protection, and out of leagues not infrequently arose commercial republics. The Hanseatic League, founded as early as 1241, gave the first note of an increasing traffic between countries on the Baltic and in northern Germany, which a century or two before were sunk in isolated barbarism. From Lübeck and Hamburg, commanding the navigation of the Elbe, it gradually spread over 85 towns, including Amsterdam, Cologne and Frankfort in the south, and Danzig, Königsberg and Riga in the north. The last trace of this league, long of much service in protecting trade, and as a means of political mediation, passed away in the erection of the German empire (1870), but only from the same cause that had brought about its gradual dissolution—the formation of powerful and legal governments—which, while leaving to the free cities their municipal rights, were well capable of protecting their mercantile interests. The towns of Holland found lasting strength and security from other causes. Their foundations were laid as literally in the sea as those of Venice had been. They were not easily attacked whether by sea or land, and if attacked had formidable means of defence. The Zuyder Zee, which had been opened to the German Ocean in 1282, carried into the docks and canals of Amsterdam the traffic of the ports of the Baltic, of the English Channel and of the south of Europe, and what the seas did for Amsterdam from without the Rhine and the Maas did for Dort and Rotterdam from the interior. By the Union of Utrecht in 1579 Holland became an independent republic, and for long after, as it had been for some time before, was the greatest centre of maritime traffic in Europe. The rise of the Dutch power in a low country, exposed to the most destructive inundations, difficult to cultivate or even to inhabit, affords a striking illustration of those conditions which in all times have been found specially favourable to commercial development, and which are not indistinctly reflected in the mercantile history of England, preserved by its insular position from hostile invasion, and in its exertions to protect its goods on the seas and the rights of its subjects in foreign countries.

The progress of trade and productive arts in the middle ages, though not rising to much international exchange, was very considerable both in quality and extent. The republics of Italy, which had no claim to rival Venice or Genoa in maritime power or traffic, developed a degree of art, opulence and refinement commanding the admiration of modern times; and if any historian of trans-Alpine Europe, when Venice had already attained some greatness, could have seen it five hundred years afterwards, the many strong towns of France, Germany and the Low Countries, the great number of their artisans, the products of their looms and anvils, and their various cunning workmanship, might have added many a brilliant page to his annals. Two centuries before England had discovered any manufacturing quality, or knew even how to utilize her most valuable raw materials, and was importing goods from the continent for the production of which she was soon to be found to have special resources, the Flemings were selling their woollen and linen fabrics, their linen, silk, woolen, silk and cotton cloths, which the French and English merchants purchased in quantity, to all parts of the world. The Hanseatic League of German and other northern populations of Europe under a severe discipline, trained them in the most varied branches of industry, and developed an amount of handicraft and ingenuity which became a solid basis for the future. But trade was too walled in, too much clad in armour, and too incessantly disturbed by wars and tumults, and violations of common right and interest, to exert its full influence over the general society, or even to realize its most direct advantages. It wanted especially the freedom and mobility essential to much international increase, and these it was now to receive from a series of the most pregnant events.

The mariner’s compass had become familiar in the European ports about the beginning of the 14th century, and the seamen of Italy, Portugal, France, Holland and England entered upon a more enlightened and adventurous course of navigation. The Canary Islands were sighted by a French vessel in 1330, and colonized in 1418 by the Portuguese, who two years later landed on Madeira. In 1431 the Azores were discovered by a shipmaster of Bruges. The Dutch were next, and in 1471 the Portuguese, steering his course almost unwittingly along the coast of Africa, came upon the land’s-end of that continent; and eleven years afterwards Vasco da Gama, of the same nation, not only doubled the Cape of Good Hope, but reached India. About the same period Portuguese travellers penetrated to India by the old-time honoured way of Suez; and a land which tradition and imagination had invested with almost fabulous wealth and splendour was becoming more real to the European world at the moment when the expedition of Vasco da Gama had made an oceanic route to its shores distinctly visible. One can hardly now realize the impression made by these discoveries
in an age when the minds of men were awakening out of a long sleep, when the printing press was disseminating the ancient classical and sacred literature, and when geography and astronomy were subjects of eager study in the seats both of traffic and of learning. But their practical effect was seen in swiftly succeeding events. Before the end of the century Columbus had thrice crossed the Atlantic, touched at San Salvador, discovered Jamaica, Porto Rico and the Isthmus of Darien, and had seen the waters of the Orinoco in South America. Meanwhile Cabot, sent out by England, had discovered Newfoundland, planted the English flag on Labrador, Nova Scotia and Virginia, and made known the existence of an expanse of land now known as Canada. This tide of discovery by navigators flowed on without intermission. But the opening of a maritime route to India and the discovery of America, surprising as these events must have been at the time, were slow in producing the results of which they were a sure prognostic. The Portuguese established in Cochin the first European factory in India a few years after Vasco da Gama's expedition, and other maritime nations of Europe traced a similar course. But it was not till 1600 that the English East India Company was established, and the opening of the first factory of the Company in India must be dated some ten or eleven years later. So also it was one thing to discover the two Americas, and another, in any real sense, to possess or colonize them, or to bring their productions into the general traffic and use of the world. Spain, following the stroke of the valiant oar of Columbus, found in Mexico and Peru remarkable remains of an ancient though feeble civilization, and a wealth of gold and silver mines, which to Europeans of that period was fascinating from the rarity of the precious metals in their own realms, and consequently gave to the Spanish colonizations and conquests in South America an extraordinary but unsolid prosperity. The value of the precious metals in Europe was found to fall as soon as they began to be more widely distributed, a process in itself at that period of no small tediousness; and it was discovered further, after a century or two, that the production of gold and silver is limited like the production of other commodities for which they exchange, and only increased in quantity at a heavier cost, that is only reduced again by greater art and science in the process of production. Many difficulties, in short, had to be overcome, many wars to be waged, and many deplorable errors to be committed, in turning the new advantages to account. But given a maritime route to India and the discovery of a new world of continent and islands in the richest tropical and sub-tropical latitudes, it could not be difficult to foresee that the course of trade was to be wholly changed as well as vastly extended.

The substantial advantage of the oceanic passage to India by the Cape of Good Hope, as seen at the time, was to enable European trade with the East to escape from the Moors, Algerines and Turks who now swarmed round the shores of the Mediterranean, and waged a predatory war on ships and cargoes which would have been a formidable obstacle even if traffic, after running this danger, had not to be further levied on, or filtered into the smallest proportions, in the hands of the Isthmus, and dangerously among the Arabs who commanded the navigation of the Red and Arabian Seas. Venice had already begun to decline in her wars with the Turks, and could inadequately protect her own trade in the Mediterranean. Armed vessels sent out in strength from the Western ports often fared badly at the hands of the pirates. European trade with India can scarcely be said, indeed, to have yet come into existence. The maritime route was round about, and it lay on the hitherto almost untroubled ocean, but the ocean was a safer element than inland seas and deserts infested by the lawlessness and ferocity of hostile tribes of men. In short, the maritime route enabled European traders to see India for themselves, to examine what were its products and its wants, and by what means a profitable exchange on both sides could be established; and on this basis of knowledge, ships could leave the ports of their owners in Europe with a reasonable hope, via the Cape, of reaching the places to which they were destined without transhipment or other intermediary obstacle. This is the explanation to be given of the joy with which the Cape of Good Hope route was received, as well as the immense influence it exerted on the future course and extension of trade, and of the no less important line with which it was to somewhat discerned in favour of the ancient line, via the Mediterranean, Isthmus of Suez and the Red Sea. The maritime route to India was the discovery to the European nations of a "new world" quite as much as the discovery of North and South America and their central isthmus and islands. The one was the far, populous Eastern world, heard of from time immemorial, but with which there had been no patent lines of communication. The other was a vast and comparatively unpeopled solitude, yet full of material resources, and capable in a high degree of European colonization. America offered less resistance to the action of Europe than India, China and Japan; but on the other hand this new populous Eastern world held out much attraction to trade. These two great terrestrial discoveries were contemporaneous; and it would be difficult to name any conjunction of material events bearing with such importance on the history of the world. The Atlantic Ocean was the medium of both; and the waves of the Atlantic beat into all the bays and tidal rivers of western Europe. The centre of commercial activity was thus physically engaged; and the formative power of trade over human affairs was seen in the subsequent phenomena—the rise of great seaports on the Atlantic seaboard, and the ceaseless activity of geographical exploration, manufactures, shipping and emigration, of which they became the outlets.

The Portuguese are entitled to the first place in utilizing the new sources of wealth and commerce. They obtained Macao as a settlement from the Chinese as early as 1537, and their trading operations followed close on the discoveries of their navigators on the coast of Africa, in India and in the Indian Archipelago. Spain spread her dominion over Central and South America, and forced the labour of the subject natives into the gold and silver mines, which seemed in that age the chief prize of her conquests. France introduced her trade in both the East and West Indies, and was the first to colonize Canada and the Lower Mississippi. The Dutch founded New York in 1621; and England, which in boldness of naval and commercial enterprise had attained high rank in the reign of Elizabeth, established the thirteen colonies which became the United States, and otherwise had a full share in all the operations which were transforming the state of the world. The original disposition of affairs was destined to be much changed by the fortune of war; and success in foreign trade and colonization, indeed, called into play other qualities besides those of naval and military prowess. The products of so many new countries—tissues, dyes, metals, articles of food, chemical substances—greatly extended the range of European manufacture. But in addition to the mercantile faculty of discovering how they were to be exchanged and wrought into a profitable trade, their use in arts and manufactures required skill, invention and aptitude for manufacturing labour, and those again, in many cases, were found to depend on abundant possession of natural materials. In other words, and a populous countries, like India and China, modern manufacture had to be imported and contend with ancient manufacture, and had at once to learn from and improve economically on the established models, before an opening could be made for its extension. In many parts of the New World there were vast tracts of country, without population or with native races too wild and savage to be reclaimed to habits of industry, whose resources could only be developed by the introduction of colonies of Europeans; and innumerable experiments disclosed great variety of qualification among the European nations for the adventure, hardship and perseverance of colonial life. There were countries which, whatever their fertility of soil or favour of climate, produced nothing for which a market could be found; and products such as the sugar-cane and the seed of the cotton plant had to be carried from regions where they were indigenous to other regions where they might be successfully cultivated, and the art of planting had to pass through an ordeal of risk and speculation. There were
also countries where no European could labour; and the ominous work of transporting African negroes as slaves into the colonies—began by Spain in the first decade of the 16th century, followed up by Portugal, and introduced by England in 1562 into the West Indies, at a later period into New England and the Southern States, and finally domiciled by royal privilege of trade in the Thames and three or more outports of the kingdom,—after being done on an elaborate scale, and made the basis of an immense superstructure of labour, property and mercantile interest over nearly three centuries, had, under a more just and ennobling view of humanity, to be as elaborately undone at a future time.

These are some of the difficulties that had to be encountered in utilizing the great maritime and geographical conquests of the new epoch. But one cannot leave out of view the obstacles, arising from other sources, to what might be expected to be the regular and easy course of affairs. Commerce, though an undying and prevailing interest of civilized countries, is but one of the forces acting on the policy of states, and has often to yield the pace to other elements of national life. It was needless to say what injury the great but vain and purposeless wars of Louis XIV. of France inflicted on that country, or how largely the fruitful and heroic energies of England were absorbed in the civil wars between Charles and the Parliament, to what poverty Scotland was reduced, or in what distraction and savagery Ireland was kept by the same course of events. The grandeur of Spain in the preceding century was due partly to the claim of her kings to be Holy Roman emperors, in which imperial capacity they entailed intolerable mischief on the Low Countries and on the commercial civilization of Europe, and partly to their command of the gold and silver mines of Mexico and Peru, in an eager lust of whose produce they brought cruel calamities on a newly-discovered continent where there were many traces of antique life, the records of which perished in their hands or under their feet. These ephemeral causes of greatness removed, the hollowness of the situation was exposed; and Spain, though rich in her own natural resources, was found to be actually poor—poor in number of people, poor in roads, in industrial art, and in all the primary conditions of interior development. An examination of the foreign trade of Europe two centuries after the opening of the maritime route to India and the discovery of America would probably give more reason to be surprised at the smallness than the magnitude of the use that had been made of these events.

By the beginning of the 19th century the world had been well explored. Colonies had been planted on every coast; great nations had sprung up in vast solitudes or in countries inhabited only by savage or decadent races of men; the most haughty and exclusive of ancient nations had opened their ports to foreign merchants; and all parts of the world been brought into habitual commercial intercourse. The seas, subdued by the progress of navigation to the service of man, had begun to yield their own riches in great abundance and the whale, seal, herring, cod and other fisheries, prosecuted with ample capital and hardy seamanship, had become the source of no small traffic in themselves. The lists of imports and exports and of the places from which they flowed to and from the centres of trade, as they swelled in bulk from time to time, show how busily and steadily the threads of commerce had been weaving together the labour and interests of mankind, and extending a security and bounty of existence unknown in former ages. The 19th century witnessed an extension of the commercial relations of mankind of which there was no parallel in previous history. The heavy debts and taxes, and the currency complications in which the close of the Napoleonic wars left the European nations, as well as the fall of prices which was the necessary effect of the sudden closure of a vast war expenditure and absorption of labour, had a crippling effect for many years on trading energies. Yet even under such circumstances commerce is usually found, on its well-established modern basis, to make steady progress from one series of years to another. The powers of production had been greatly increased by a brilliant development of mechanical arts and inventions. The United States had grown into a commercial nation of the first rank. The European colonies and settlements were being extended, and assiduously cultivated, and were opening larger and more varied markets for manufactures. In 1819 the first steamboat crossed the Atlantic from New York to Liverpool, and a similar adventure was accomplished from England to India in 1825—events in themselves the harbingers of a new era in trade. China, after many efforts, was opened under treaty to an intercourse with foreign nations which was soon to attain surprising dimensions. These various causes supported the activity of commerce in the first four decades; but the great movement which made the 19th century so remarkable was chiefly disclosed in practical results from about 1840. The outstanding characteristics of the 19th century were the many remarkable inventions which so widened the field of commerce by the discovery of new and improved methods of production, the highly organized division of labour which tended to the same end, and, above all, the powerful forces of steam navigation, railways and telegraphs.

Commerce has thus acquired a security and extension, in all its most essential conditions, of which it was void in any previous age. Rarely, if ever, can a foreigner, after a visit to Europe, fail to wonder what influence it may have exerted on the various countries of his own extensive travels. It is easy to say, with much truth, that the world in general has never been in such a condition as at present. The consequence of the close of the Napoleonic wars has been the opening of all the products of the world to all the manufacturers of the world, and the diffusion of all the merchandises of the world. The commerce of Europe has been opened to the commerce of America, the commerce of America to that of Europe, and the commerce of all the world to that of the whole world. The geographical discoveries of the modern age have opened the great mass of the earth to the prudential interests of the nations of the earth. The whole face of the earth is now covered with commerce, and the whole face of mankind is now covered with the effects of commerce.

COMMERC, the name of a card-game. Any number can play with an ordinary pack. There are several variations of the game, but the following is a common one. Each player receives three cards, and three more are turned up as a "pool." The first player may exchange one or two of his cards for one or two of the exposed cards, putting his own, face upwards, in their place. His object is to "make his hand" (see below), but if he changes all three cards at once he cannot change again. The next player can do likewise, and so on. Usually there are as many rounds as there are players, and a fresh card is added to the pool at the beginning of each. If a player passes once he cannot exchange afterwards. When the rounds are finished the hands are shown, the holder of the best either receiving a stake from
COMMERCIAL COURT—COMMERCIAL TREATIES

all the others, or, supposing each has started with three “lives,”
taking one life from the lowest. The hands, in order of merit,
are: (i.) Tricote—the same cards, three aces ranking above
two kings, and so on. (ii) Sequence—three cards of the same
suit in consecutive order; the highest sequence is the best.
(iii) Flush—three cards of the same suit, the highest “point”
wins, i.e. the highest number of pips, ace counting eleven and
court-cards ten. (iv) Pair—two similar cards, the highest pair
winning. (v) Point—the largest number of pips winning, as in
“flush,” but there is no restriction as to suit. Sometimes
“pair” and “point” are not recognized. A popular variation
of Commerce is Pounce Commerce. In this, if a player has
already three similar cards, etc. three nines, and the fourth nine
comes into the pool, he says “Pounce!” and takes it, thus obtaining
a hand of four, which is higher than any hand of three:
whenever a pounce occurs, a new card is turned up from the pack.

COMMERCIAL COURT, in England, a court presided over
by a single judge of the king’s bench division, for the trial, as
expeditiously as may be, of commercial cases. By the Rules
of the Supreme Court, Order xvi. a (made in November 1893),
a plaintiff was allowed to dispense with pleadings altogether,
provided that the indorsement of his writ of summons contained
a statement sufficient to give notice of his claim, or of the relief
or remedy required in the action, and stating in what court he
intended to proceed to trial without pleading. The judge might,
if on the application of the defendant, order a statement of claim
to be delivered, or the action to proceed to trial without pleadings,
and if necessary particular of the claim or defence to be delivered.
Out of this order grew the commercial court. It is not a distinct
court or division or branch of the High Court, and is not regulated
by any special rules of court made by the rule committee.
It originated in a notice issued by the judges of the queen’s bench
division, in February 1893 (see W.N., 2nd of March 1893), the
provisions contained in which represent only “a practice agreed
on by the judges, who have the right to deal by convention
among themselves with this mode of disposing of the business
in their courts” (per Lord Esher in Barry v. Persian Corporation,
1896, 1 Q. B. p. 209). A separate list of causes of a commercial
character is made and assigned to a particular judge,
charged with commercial business, to whom all applications
before the trial are made. The 8th paragraph is as follows:—

Such judge may at any time appear and without pleadings
make such order as he thinks fit for the speedy determination,
in accordance with the long rules, of the questions really in
controversy between the parties.

Practitioners before Sir George Jessel, at the rolls, in the years
1872 to 1880, will be reminded of his mode of ascertaining the
point in controversy and bringing it to a speedy determination.
Obviously the scheme is only applicable to cases in which there
is some single issue of law or fact, or the case depends on
the construction of some contract or other instrument or section
of an act of parliament, and such issue or question is either agreed
upon by the parties or at once ascertainable by the judge.
The success of the scheme also depends largely on the personal
qualities of the judge to whom the list is assigned. Under the
able guidance of Mr (afterwards Lord) Justice Mathew (d. 1908),
the commercial court became very successful in bringing cases to a
speedy and satisfactory determination without any technicality
or unnecessary expense.

COMMERCIAL LAW, a term used rather indefinitely to
include those main rules and principles which, with more or less
minor differences, characterize the commercial transactions
and customs of most European countries. It includes within
its compass such titles as principal and agent; carriage by land
and sea; merchant shipping; guarantee; marine, fire, life
and accident insurance; bills of exchange, partnership, &c.

COMMERCIAL TREATIES. A commercial treaty is a contract
between two or more states relative to trade. It is a bilateral act whereby
definite arrangements are entered into by each contracting
country towards the other—not mere conventions. As regards
technical distinctions, an “agreement,” an “exchange of
notes,” or a “convention” properly applies to one specific
subject; whereas a “treaty” usually comprises several matters,
whether commercial or political.

In ancient times foreign intercourse, trade and navigation
were in many instances regulated by international arrangements.
The text is extant of treaties of commerce and navigation con-
cluded between Carthage and Rome in 309 and 348 B.C. Aristotle
mentions that nations were connected by commercial treaties;
and other classical writers advert to these engagements. Under
the Roman empire the matters thus dealt with became regulated
by law, or by usages sometimes styled laws. When the territories
of the empire were contracted, and the imperial authority was
weakened, some kind of international agreements again became
necessary. At Constantinople in the 10th century treaties cited
by Gibbon protected “the person, effects and privileges of
the Russian merchant”; and, in western Europe, intercourse,
trade and navigation were carried on, at first tacitly by usage
derived from Roman times, or under verbal permission given
to merchants by the ruler to whose court they resorted. After-
wards, security in these transactions was afforded by means of
formal documents, such as royal letters, charters, laws and other
instruments possessing the force of government measures.
Instances affecting English commercial relations are the letter
of Charlemagne in 796, the Brabant Charter of 1305, and the
treaties of 1496 by which the German, Italian, and English
shippers were protected. But these medieval treaties of truce or peace
often contained a clause permitting in general terms the renewal
of personal and commercial communication as it subsisted before
the war. This custom is still followed. But these medieval
arrangements were precarious: they were often of temporary
duration, and were usually only effective during the lifetime
of the contracting sovereigns.

Passing over trade agreements affecting the Eastern empire,
the modern commercial treaty system came into existence in the 18th
century. Genoa, Pisa and Venice were then well-organized
commercial communities, and were in keen rivalry. Whenever their position in
a foreign country was strong, a trading centre was established, and
few or no specific engagements were made on their part. But in
serious competition or difficulty another course was adopted:
a formal agreement was concluded for the better security of their
commerce and navigation. The arrangements of 1140 between
Venice and Sicily; the Genoese conventions of 1149 with Valencia,
of 1161 with Morocco, and of 1181 with the Balearic Islands;
the Pisan conventions of 1173 with Sultan Saladin, and of 1184
with the Balkaric Islands, were the earliest Western commercial
treaties. Such definite arrangements, although still of a personal
character, were soon perceived to be preferable to general pro-
visions for security of trade by truce or peace. They afforded
also greater security than privileges enjoyed under usage; or under grants
of various kinds, whether local or royal. The policy thus
inaugurated was adopted gradually throughout Europe. The first
arrangements relative to the trade of the Netherlands were between
Brabant and Holland in 1203, Holland and Utrecht in 1204,
and Brabant and Cologne in 1251. Early northern commercial
arrangements were those between Riga and Smolensk in 1229,
and between Lübeck and Sweden 1269. The first commercial relations
between the Hanse Towns and foreign countries were arrange-
ments made by gilds of merchants, not by public authorities as a
governing body. For a long period the treaty system did not
entirely supersede conditions of intercourse between nations
dependent on permission.

The earliest English commercial treaty is that with Norway in
1217. It provides “ut mercatores et homines qui sunt de
potestate vestra liberet et sine impedimento terram nostram adire
possint, et homines et mercatores nostri similiter vestram.”
These stipulations are in due treaty form. The next early
English treaties are—-with Flanders, 1274 and 1314; Portugal,
1308, 1352 and 1356; Baltic Cities, 1310 and 1388; Biscaia and
Burgundy, 1417 and 1496; France, 1471, 1497
and 1510; Florence, 1490. The commercial treaty policy in
England was carried out systematically under Henry IV. and
Henry VII. It was continued under James I. to extend to
Scotland English trading privileges. The results attained in the
17th century were—regularity in treaty arrangements; their
COMMERCIAL TREATIES

durable instead of personal nature; the conversion of permissive into perfect rights; questions as to contraband and neutral trade stated in definite terms. Treaties were at first limited to exclusive and distinct engagements between the contracting states; each treaty differing more or less in its terms from other similar compacts. Afterwards by extending to a third nation privileges granted to particular countries, the **most favoured nation article** began to be framed, as a unilateral engagement by a particular state. The Turkish capitulations afford the earliest instances; and the treaty of 1641 between the Netherlands and Portugal contains the first European formula. Cromwell continued the commercial treaty policy partly in order to obtain a formal recognition of the commonwealth from foreign powers. His treaty of 1654 with Sweden contains the first reciprocal "most favoured nation clause".—Article IV. provides that the people, subjects and inhabitants of either confederate "shall have and possess in the countries, lands, dominions and kingdoms of the other as full and ample privileges, and as many exemptions, immunities and liberties, as any foreigner doth or shall possess in the dominions and kingdoms of the said confederate." The government of the Restoration replaced and enlarged the Protectorate arrangements by fresh agreements. The general policy of the 18th century continued to be based on the principle that, whatever was the right of the most favored nation, it would be more advantageous to Britain to insist on it as a right than to recognize the difference as a fact.

In contemporary treaties France obtained from Spain (1659) that French subjects should enjoy the same liberties as had been granted to the English; and England obtained from Denmark (1661) that the English should not pay more or greater customs than the people of the United Provinces and other foreigners, the Swedes only excepted. The colonial and navigation policy of the 17th century, and the proceedings of Louis XIV., provoked animosities and retaliatory tariffs. During the War of the Spanish Succession the Methuen Treaty of 1703 was concluded. Portugal removed prohibitions against the importation of British woollens; Great Britain engaged that Portuguese wines should pay one-third less duty than the rate levied on French wines. At the peace of Utrecht in 1713 political and commercial treaties were concluded. England agreed to remove prohibitions on the importation of French goods, and to grant most favoured nation treatment in all matters to goods from any other country in Europe; the French general tariff of the 18th of September 1664, was to be again put in force for English trade. The English provision was at variance with the Methuen Treaty. A violent controversy arose as to the relative importance in 1713 of Anglo-Portuguese or Anglo-French trade. In the end the House of Commons, by a majority of 9, rejected the bill to give effect to the commercial treaty of 1713; and trade with France remained on an unsatisfactory footing until 1786. The other commercial treaties of Utrecht were very complete in their provisions, equal to those of the present time; and contained most favoured nation articles—England secured in 1715 reduction of duties on woollens imported into the Austrian Netherlands; and trading privileges in Spanish America. Moderate import duties for woollens were obtained in Russia by the commercial treaty of 1766. In the meanwhile the Bourbon family compact of the 13th of August 1761 assured national treatment for the subjects of France, Spain and the Two Sicilies, and for their trade in the European territories of the other two states; and most favoured nation treatment as regards any special terms granted to any foreign country. The first commercial treaties concluded by the United States with the Venetian Republic and with the Cape of Good Hope, and the British and Dutch possessions in the East Indies, contained most favoured nation clauses: this policy has been continued by the United States, but the wording of the clause has often varied.

In 1786 France began to effect tariff reform by means of commercial treaties. The first was with Great Britain, and it terminated the long-continued tariff warfare. But the wars of the French Revolution swept away these reforms, and brought about a renewal of hostile tariffs. Prohibitions and differential duties were renewed, and prevailed on the continent until the sixth decade of the 19th century. In 1860 a government existed in France sufficiently strong and liberal to revert to the policy of 1786. The bases of the Anglo-French treaty of 1860, beyond its most favoured nation provisions, were in France a general transition from prohibition or high customs duties to a moderate tariff; in the United Kingdom abandonment of all protective imposts, and reduction of duties maintained for fiscal purposes to the lowest rates compatible with these exigencies. Other European countries were obliged to obtain for their trade the benefit of the conventional tariff thus established in France, as an alternative to the high rates inscribed in the general tariff. A series of commercial treaties was accordingly concluded by different European states between 1861 and 1866, which effected further reductions of customs duties in the several countries that came within this treaty system. In 1871 the Republican government sought to terminate the treaties of the empire. The British negotiations nevertheless obtained the relinquishment of the attempt to levy protective duties under the guise of compensation for imposts on raw materials; the duration of the treaty of 1860 was prolonged; and stipulations were agreed to that in future wars and most tariff reductions or reforms, not less than 1863, however, France terminated her existing European tariff treaties. Belgium, Switzerland, Germany, Austria, and the other countries concluded fresh treaties, less liberal than those of the system of 1860, yet much better than anterior arrangements. Great Britain did not formally accept these higher duties; the treaty of the 28th of February 1884, with France, which secured most favoured nation treatment in other matters, provided that customs duties should be "henceforth regulated by the internal legislation of each of the two states." In 1892 France also fell out of international tariff arrangements; and adopted the system of double columns of customs duties—one, of lower rates, to be applied to the goods of all nations receiving most favoured treatment; and the other, of higher rates, for countries not on this footing. Germany then took up the treaty tariff policy; and between 1891 and 1894 concluded several commercial treaties.

International trade in Europe in 1909 was regulated by a series of tariffs which came into operation, mainly on the initiative of Germany in 1906. Austria-Hungary, Belgium, Bulgaria, Germany, Italy, Rumania, Russia, Servia and Switzerland, were parties to them. Their object and effect was protectionist. The depression which followed the world war, obtaining modifications to remedy disadvantages to British trade, was in the case of Bulgaria and Rumania. An important series of commercial arrangements had been concluded between 1884 and 1900 respecting the territories and spheres of interest of European powers in western, central and eastern Africa. In these regions exclusive privileges were not claimed; most favoured nation treatment was recognized, and there was a disposition to extend national treatment to all Europeans and their trade.

The Turkish Capitulations (q.v.) are grants made by successive sultans to Christian nations, conferring rights and privileges in favour of their subjects resident or trading in the Ottoman dominions, following the policy towards European states of the Eastern empire. In the first instance capitulations were granted separately to each Christian state, beginning with the Genoese in 1453, which entered into pacific relations with Turkey. Afterwards new capitulations were obtained which summed up in one document earlier concessions, and added to them in general terms whatever had been conceded to one or more other states; a stipulation which became a most favoured nation article. The English capitulations date from 1569, and then secured the same treatment as the Venetian, French, Poles and the subject of the emperor of Germany; they were revised in 1675, and as the settled were confirmed by treaties of subsequent date "now and for ever." Capitulations signify that which is arranged under distinct "headings"; the Turkish phrase is "ibid namez," whereas a treaty is "muahed6”—the latter does, and the former does not, signify a reciprocal engagement. Thus, although the Turkish capitulations are not in themselves treaties, yet by subsequent confirmation they have acquired the force of commercial
treaties of perpetual duration as regards substance and principles, while details, such as rates of customs duties, may, by mutual consent, be varied from time to time.

The most favoured nation article already referred to concedes to the state in the treaty with which it is concluded whatever advantages in matters comprised within its stipulations have been allowed to any foreign or third state. It does not in itself directly confer any particular rights, but sums up the whole of the rights in the matters therein mentioned which have been or may be granted to foreign countries. The value of the privileges under this article accordingly varies with the conditions as to these rights in each state which concedes this treatment.

The article is drafted in different form:

1. That contracting states A. and B. agree to extend to each other whatever rights and privileges they concede to countries C. and D., or to C. and D. and any other country. The object in this instance is to ensure specifically to B. and A. whatever advantages C. and D. may possess. A recent instance is Article XI. of the treaty of May 10, 1871, between France and Germany, which binds them respectively to extend to each other whatever advantages they confer on their respective terri- 

2. The present general formula: A. and B. agree to extend to each other whatever advantages they concede to any third country; and in the event of a third country or higher duties be levied on the importation into A. and B. respectively of goods the produce or manufacture of A. and B. than are levied on the like goods the produce or manufacture of any country the most favoured in this respect. There is a reciprocal clause in regard to exportation.

3. The conditional or reciprocity formula, often used in the 18th and in the early part of the 19th century, namely, that whenever A. and B. make special concessions to another or to countries A. respectively are either excluded from participation therein, or must make some additional equivalent concession in order to participate in those advantages. It may further be observed that the word "like" relates to the goods themselves, to their material or quality, not to conditions of manufacture, mode of conveyance or anything beyond the fact of their precise description; small local facilities allowed to traffic between contiguous land districts are not at variance with this article.

A recent complete and concise English formula is that of Article 2 of the treaty of commerce and navigation of the 31st of October, 1905, with Rumania. "The contracting parties agree that, whenever matters relating to the treaty are in dispute as to the conditions of protection and industry, any privilege, favour or immunity which either contracting party has actually granted, or may hereafter grant, to the subjects or citizens of any other foreign state, shall be extended immediately and uncondi-

4. And in the case of a commercial treaty concluded by the United States, with the intention that the commerce, navigation and industry of each country shall be placed, in all respects, on the footing of the most favoured nation."

Colonies.—The application of commercial treaties to colonies depends upon the wording of each treaty. The earlier colonial policy of European states was to subordinate colonial interests to those of the mother country, to reserve colonial trade for the mother country, and to abstain from engagements contrary to these general rules. France, Portugal and Spain have adhered in principle to this policy. Germany and Holland have been more liberal. The self-government enjoyed by the larger British colonies has led since 1860 to the insertion of an article in British commercial and other treaties whereby the assent of the mother colonies, and likewise of India, is reserved before they apply to each of these possessions. And further, the fact that certain other British colonies are now within the sphere of commercial intercourse controlled by the United States, has since 1891 induced the British government to enter into special agreements on behalf of colonies for whose products the United States is now the chief market. As regards the most favoured nation article, it is to be remembered that the mother country and colonies are not distinct—not foreign or third—countries with respect to each other. The most favoured nation article, therefore, does not preclude special arrangements between the mother country and colonies, nor between colonies.

Termination.—Commercial treaties are usually concluded for a term of years, and either lapse at the end of this period, or are terminable then, or subsequently, if either state gives the required notice. When a portion of a country establishes its independence, for example the several American republics, according to present usage foreign trade is placed on a uniform most favoured nation footing, and fresh treaties are entered into to regulate the commercial relations of the new communities. In the case of former Turkish provinces, the capitulations remain in force in principle until they are replaced by new engagements. If one state is absorbed into another, for instance Texas into the United States, or when territory passes by conquest, for instance Alsace to Germany, the commercial treaties of the new supreme government take effect. In administered territories, as Cyprus and formerly Bosnia, and in protected territories, it depends on the policy of the administering power how far the previous fiscal system shall remain in force. When the separate Italian states were united into the kingdom of Italy in 1861, the commercial engagements of Sardinia superseded those of the other states, but fresh treaties were concluded by the new kingdom to place international relations on a regular footing. When the German empire was established under the constitution of Prussia in 1871, the commercial engagements of any state which were at variance with a Zollverein treaty were superseded by that treaty. Hence the scope of commercial treaties is well expressed by Calvo in his work on international law. They provide for the importation, exportation, transit, transhipment and bonding of merchandise; customs tariffs; navigation charges; quarantine; the admission of vessels to roadsteads, ports and docks; coasting trade; the admission of consuls and their rights; fisheries; they determine the local position of the subjects of each state in the other country in regard to residence, property, payment of taxes or exemptions, and military service; nationality; and a most favoured nation clause. They usually contain a termination, and sometimes a colonial article. Some of the matters enumerated by Calvo—consular privileges, fisheries and nationality—are now frequently dealt with by separate conventions. Contraband and neutral trade are not included as frequently as they were in the 18th century.

The preceding statement shows that commercial treaties afford to foreigners, personally, legal rights, and relief from technical duties, and may afford security to trade and navigation, and regulate other matters comprised in their provisions. In Europe the general principles established by the series of treaties 1860–1866 hold good, namely, the substitution of uniform rates of customs duties for prohibitions or differential rates. The disadvantages urged are that these treaties involve government interference and bargaining, whereas each state should act independently as its interests require, that they are opposed to free trade, and restrict the fiscal freedom of the legislature. It may be observed that these objections imply some confusion of ideas. All contracts may be designated bargains, and some of the details of commercial treaties in Calvo's enumeration enter directly into the functions of government; moreover, countries cannot remain isolated. If two countries agree by simultaneous action to adopt fixed rates of duty, this agreement is favourable to commerce, and it is not apparent how, in any contrary, even to free trade principle. Moreover, security in business transactions, very important consideration, is provided.

Our conclusions are—

1. that under the varying jurisprudence of nations commercial treaties are adopted by common consent;
2. that their provisions depend upon the general and fiscal policy of each state;
3. that tariff arrangements, if judiciously settled, benefit trade;
4. that commercial treaties are now entered into by all states; and that they are necessary under present conditions of commercial intercourse between nations.

C. M. K.*

See the British parliamentary Return (C. 4080) of all commercial treaties between various countries in force on Jan. 1, 1908.

COMMERCE, a town of north-eastern France, capital of an arrondissement in the department of Meuse, on the left bank of the Meuse, 26 m. E. of Bar-le-Duc by rail. Pop. (1906) 5622. Commercy possesses a chateau of the 17th century, now used as a cavalry barracks. A Benedictine convent occupied by a training college for primary teachers, and a communal college for boys. A statue of Dom Calmet, the historian, born in the vicinity, stands
in one of the squares. The industries include iron-working and the manufacture of nails, boots and shoes, embroidery and hosiery. The town has trade in cattle, grain and wood, and is well known for its cakes (madeleines). Commercy dates back to the 9th century, and at that time its lords were dependent on the bishop of Metz. In 1544 it was besieged by Charles V in person. For some time the lordship was in the hands of François Paul de Gondi, cardinal de Retz, who lived in the town for a number of years, and there composed his memoirs. From him it was purchased by Charles IV, Duke of Lorraine. In 1744 it became the residence of Stanislas, King of Poland, who spent a great deal of care on the embellishment of the town, castle and neighbourhood.

COMMERYS (from Lat. commercium), the German term for the German students' social gatherings held annually on occasions such as the breaking-up of term and the anniversary of the university's founding. A Commers consists of speeches and songs and the drinking of unlimited quantities of beer. The arrangements are governed by officials (Chargiers) elected by the students from among themselves. Strict rules as to drinking exist, and the chairman after each speech calls for what is called a salamander (ad exercitium Salamandris bibere, torgerie). All rise and having emptied their glasses hammer three times on the table with them. On the death of a student, his memory is honoured with a salamander, the glasses being broken to atoms at the close.

COMMINES, Philippe de (c. 1445-c. 1511), French historian, called the father of modern history, was born at the castle of Renesencure, near Hazebrouck in Flanders, a little earlier than 1447. He lost both father and mother in his earliest years. In 1463 his godfather, Philip V, Duke of Burgundy, summoned him to his court, and soon after transferred him to the household of his son, afterwards known as Charles the Bold. He speedily acquired considerable influence over Charles, and in 1468 was appointed chamberlain and councillor; consequently when in the same year Louis XI. was entrapped at Péronne, Commines was able both to soften the passion of Charles and to give useful advice to the king, whose life he did much to save. Three years later he was charged with an embassy to Louis, who gained him over to himself by many brilliant promises, and in 1472 he left Burgundy for the court of France. He was at once made chamberlain and councillor; a pension of 6000 livres was bestowed on him; he received the principality of Talmont, the confiscated property of the Amboise family, over which the family of La Trémoille claimed to have rights. The king arranged his marriage with Héléne de Chambes, who brought him the fine lordship of Argentan, and Commines took the name d'Argenton from then (27th of January 1473). He was employed to carry out the intrigues of Louis in Burgundy, and spent several months as envoy in Italy. On his return he was received with the utmost favour, and in 1479 obtained a decree confirming him in possession of his principality.

On the death of Louis in 1483 a suit was commenced against Commines by the family of La Trémoille, and he was cast in heavy damages. He plotted against the regent, Anne de Beaujeu, and joined the party of the duke of Orleans, afterwards Louis XII. Having attempted to carry off the king, Charles VIII., and so free him from the tutelage of his sister, he was arrested, and put in one of his old master's iron cages at Locrès. In 1489 he was banished to one of his own estates for ten years, and made to give bail to the amount of 10,000 crowns of gold for his good behaviour. Recalled to the council in 1492, he strenuously opposed the Italian expedition of Charles VIII., in which, however, he took part, notably as representing the king in the negotiations which resulted in the treaty of Vercelli. During the rest of his life, notwithstanding the accession of Louis XII., whom he had served as duke of Orleans, he held no position of importance; and his last days were disturbed by lawsuits. He died at Argenton on the 18th of October, probably in 1511. His wife Héléne de Chambes survived him till 1532; their tomb is now in the Louvre.

The Mémoire, to which Commines owes his reputation as a statesman and man of letters, were written during his latter years. The graphic style of his narrative and above all the keenness of his insight into the motives of his contemporaries, an insight undimmed by undue regard for principles of right and wrong, make this work one of the great classics of history. His portrait of Louis XI. remains unique, in that to such a writer was given such a subject. Scott in Quentin Durward gives an interesting picture of Commines, from whom he largely draws. Sainte-Beuve, after speaking of Commines as being in date the first truly modern writer, and comparing him with Montaigne, says that his history remains the definitive history of his time, and that from it all political history took its rise. None of this praise is undeserved, for the pages of Commines abound with excellences. He analyses motives and pictures manners; he delineates men and describes events; his reflections are pregnant with suggestiveness, his conclusions strong with the logic of facts.

The Memoirs divided themselves into two parts, the first from the reign of Louis XI., 1464-1483, the second on the Italian expedition and the negotiations at Venice leading to the Vercell treaty, 1494-1495. The first part was written between 1489 and 1493. The Comte de Commines, brother of Luc, the second from 1495 to 1498. Seven MSS. are known, of which one is a holograph, and as this was undoubtedly badly written, the copies were inaccurate: the best is that which belonged to Anne de Polignac, niece of Commines, and it is the only one containing books vii. and viii.

The best edition of Commines is the one edited by B. de Mandrot and published at Paris in 1901-1903. For this edition the author used a manuscript hitherto unknown and more complete than the others, and in his introduction he gives an account of the life of Commines.

BIBLIOGRAPHY.—The Memoirs remained in MS. till 1524, when parts of them were printed by Galliot du Pré, the remainder first seeing light in 1524. Subsequent editions were put forth by Denys Sauvage in 1562, by Denys Godefrey in 1569, and by Lenglet Du Fresnoy in 1774. That of Mademoiselle Dupont (1841-1848) and M. de Chantelouze (1881) have many merits, but the best was given by Bernard de Mandrot: Memoirs de Philippe de Commines, from the MS. of Anne de Polignac (1901). Various translations of Commines into English have appeared, from that of T. Danett in 1640, based on the Dupont edition, which was in Bohn's series in 1855.

COMMISSARIAT, the department of an army charged with the provision of supplies, both food and forage, for the troops. The supply of military stores such as ammunition is not included in the duties of a commissariat. In almost every army the duties of transport and supply are performed by the same corps of departmental troops.

COMMISSARY (from Med. Lat. commissarius, one to whom a charge or trust is committed), generally, a representative; e.g., the emperor's representative who presided in his absence over the imperial diet; and especially, an ecclesiastical official who exercises in special circumstances the jurisdiction of a bishop (q.v.); in the Church of England this jurisdiction is exercised in a Consistory Court (q.v.), except in Canterbury, where the court of diocesan discipline is called at the metropolitan jurisdiction of the archbishop is called a commissary court, and the judge is the commissary general of the city and diocese of Canterbury. When a see is vacant the jurisdiction is exercised by a "special commissary" of the metropolitan. Commissary is also a general military term for an official charged with the duties of supply, transport and finance of an army. In the 17th and 18th centuries the commissaire des guerres, or Kriegskommissär was an important official in continental armies, by whose agency the troops, in their relation to the civil inhabitants, were placed upon semi-political control. In French military law, commissaires du gouvernement represent the ministry of war on military tribunals, and more or less correspond to the British judge-advocate (see Court-Martial).

COMMISSION (from Lat. commissio, committere), the action of committing or entrusting any charge or duty to a person, and the charge or trust thus committed, and so particularly an authority, or the document embodying such authority, given to some person to act in a particular capacity. The term is thus applied to the
written authority to command troops, which the sovereign or president, as the ultimate commander-in-chief of the nation's armed forces, grants to persons selected as officers, or to the similar authority issued to certain qualified persons to act as justices of the peace. For the various commissions of assize see Assize. The word is also used of the order issued to a naval officer to take the command of a ship of war, and when manned, armed and fully equipped for active service she is said to be "put in commission."

In the law of evidence (q.v.) the presence of witnesses may, for certain necessary causes, be dispensed with by the order of the court, and the evidence be taken by a commissioner. Such evidence in England is said to be "on commission" (see R.S.C. Order XXXVII). Such causes may be illness, the intention of the witness to leave the country before the trial, residence out of the country or the like. Where the witness is out of the jurisdiction of the court, and his place of residence is a foreign country where objection is taken to the execution of a commission, or is a British colony or India, "letters of request" for the examination of the witness are issued, addressed to the head of the tribunal in the foreign country, or to the secretary of state for the colonies for India.

Where the functions of an office are transferred from an individual to a body of persons, the body exercising these delegated functions is generally known as a commission and the members as commissioners; thus the office of lord high admiral of Great Britain is administered by a permanent board, the lords of the admiralty. Such a delegation may be also temporary, as where the authority under the great seal to give the royal assent to legislation is issued to lords commissioners. Similarly bodies of persons or single individuals may be specially charged with carrying out particular duties; these may be permanent, such as the Charity Commission or the Ecclesiastical and Church Estates Commission, or may be temporary, such as various international bodies of inquiry, like the commission which met in Paris in 1905 to inquire into the North Sea incident (see DOGGER BANK), or such as the various commissions of inquiry, royal, statutory or departmental, of which an account is given below.

A commission may be granted by one person to another to act as his agent, and particularly in business; thus the term is applied to that method of business in which goods are entrusted to an agent for sale, the remuneration being a percentage on the sales. This percentage is known as the "commission," and hence the word is extended to all remuneration which is based on a percentage on the value of the work done. The right of an agent to remuneration in the form of a "commission" is always founded upon an express or implied contract between himself and his principal. Such a contract may be implied from custom or usage, from the conduct of the principal or from the circumstances of the particular case. Such commissions are only payable on transactions directly resulting from agency and may be payable though the principal acquires no benefit. In order to claim remuneration an agent must be legally qualified to act in the capacity in which he claims remuneration. He cannot recover in respect of unlawful or wagering transactions, or in cases of misconduct or breach of duty.

Semi-Commission.—The giving of a commission, in the sense of a bribe or unlawful payment to an agent or employer in order to influence him in relation to his principal's or employer's affairs, has grown to considerable proportions in modern times; it has been rightly regarded as a gross breach of trust upon the part of employés and agents, inasmuch as it leads them to look to their own interests rather than to those of their employers. In order to suppress this bribing of employés the English legislature in 1866 passed the Prevention of Corruption Act, which enacts that if an agent corruptly accepts or obtains for himself or for any other person any gift or consideration as an inducement or reward for doing or forbearance to do any act or business, or for showing or forbearing to show favour or disfavour to any person in relation to his principal's affairs, he shall be guilty of a misdemeanour and shall be liable on conviction or indictment to imprisonment with or without hard labour for a term not exceeding two years, or to a fine not exceeding £500, or to both, or on summary conviction to imprisonment not exceeding four months with or without hard labour or to a fine not exceeding £50, or both. The act also applies the same punishment to any person who corruptly gives or offers any gift or consideration to an agent. Also if a person knowingly gives an agent, or if an agent knowingly uses, any receipt, account or document with intent to mislead the principal, they are guilty of a misdemeanour and liable to the punishment already mentioned. For the purposes of the act "consideration" includes valuable consideration of any kind, and "agent" includes any person employed by or acting for another. No prosecution can be instituted without the consent of the attorney-general, and every information must be upon oath.

Legislation to the same effect has been adopted in Australia. A federal act was passed in 1905 dealing with secret commissions, and in the same year both Victoria and Western Australia passed drastic measures to prevent the giving or receiving of corruptly commissions. The Victorian act applies to trustees, executors, administrators and liquidators as well as to agents. Both the Victorian and the Western Australian acts enact that gifts to the agent are liable to be deemed gifts to the principal unless the contrary is proved; also that the custom of any trade or calling is not in itself a defence to a prosecution.

Commissions of Inquiry, i.e. commissions for the purpose of eliciting information as to the operation of laws, or investigating particular matters, social, educational, &c., are distinguished, according to the terms of their appointment, as royal, statutory and departmental. A royal commission in England is appointed by the crown, and the commissions usually issue from the office of the executive government which they specially concern. The objects of the inquiry are carefully defined in the warrant constituting the commission, which is termed the "reference." The commissioners give their services gratuitously, but where they involve any great degree of professional skill compensation is allowed for time and labour. The expenses incurred are provided out of money annually voted for the purpose. Unless expressly empowered by act of parliament, a commission cannot compel the production of documents or the giving of evidence, nor can it administer an oath. A commission may hold its sittings in any part of the United Kingdom, or may institute and conduct experiments for the purpose of testing the utility of invention, &c. When the inquiry or any particular portion of it is concluded, a report is presented to the crown through the home department. All the commissioners, if unanimous, sign the report, but those who are unable to agree with the majority can record their dissent, and express their individual opinions, either in paragraphs appended to the report or in separately signed memoranda.

Statutory commissions are created by acts of parliament, and, with the exception that they are liable to have their proceedings questioned in parliament, have absolute powers within the limits of their prescribed functions and subject to the provisions of the act defining the same. Departmental commissions or committees are appointed either by a treasury minute or by the authority of a secretary of state, for the purpose of instituting inquiries into matters of official concern or examining into proposed changes in administrative arrangements. They are generally composed of two or more permanent officials of the department concerned in the investigation, along with a subordinate member of the administration. Reports of such committees are usually regarded as confidential documents.

A full account of the procedure in royal commissions will be found in A. Todd's Parliamentary Government in England, vol. ii.

COMMISSIONAIRE, the designation of an attendant, messenger or subordinate employé in hotels on the continent of Europe, whose chief duty is to attend at railway stations, secure customers, take charge of their luggage, carry out the necessary formalities with respect to it and have it sent on to the hotel. They are also employed in Paris as street messengers, light porters, &c. The Corps of Commissionaires, in England, is an association of pensioned soldiers of trustworthy character, founded in 1859 by Captain Sir Edward Walter, K.C.B. (1823-1904).
COMMISSIONER—COMMODIANUS

It was first started in a very small way, with the intention of providing occupation for none but wounded soldiers. The nucleus of the corps consisted of eight men, each of whom had lost a limb. The demand, however, for neat, uniformed, trusty men, to perform certain light duties, encouraged the founder to extend his idea, and the corps developed into a large self-supporting organization. In 1906 there were over 3000 members of the corps, more than 2000 of whom served in London. Outstations were established in various large towns of the kingdom, and the corps extended its operations also to the colonies.

COMMISSIONER, in general an officer appointed to carry out some particular work, or to discharge the duty of a particular office; one who is a member of a commission (q.v.). In this sense the word is applied to members of a permanently constituted department of the administration, as civil service commissioners, commissioners of income tax, commissioners in lunacy, &c. It is also the title given to the heads of or important officials in various governmental departments, as commissioner of customs.

In some British possessions in Africa and the Pacific the head of the government is styled high commissioner. In India a commissioner is the chief administrative official of a division which includes several districts. The office does not exist in Madras, where the same duties are discharged by a board of revenue, but is found in most of the other provinces. The commissioner comes midway between the local government and the district officer. In the regulation provinces the district officer is called a collector (q.v.), and in the non-regulation provinces a deputy-commissioner. In the former he must always be a member of the covenanted civil service, but in the latter he may be a military officer.

A chief commissioner is a high Indian official, governing a province inferior in status to a lieutenant-governorship, but in direct subordination to the governor-general in council. The provinces which have chief commissioners are the Central Provinces and Berar, the North-West Frontier Province and Coorg. The agent to the governor-general of Baluchistan is also chief commissioner of British Baluchistan, the agent to the governor-general of Rajputana is also chief commissioner of the British district of Ajmere-Merwar, and there is a chief commissioner of the Andaman and Nicobar islands. Several provinces, such as the Punjab, Oudh, Burma and Assam, were administered by chief commissioners before they were raised to the status of lieutenant-governorships (see Lieutenant).

A commissioner for oaths in England is a solicitor appointed by the lord chancellor to administer oaths to persons making affidavits for the purpose of any cause or matter. The Commissioner for Oaths Act 1889 (with an amending act 1891), amending and consolidating various other acts, regulates the appointment and powers of such commissioners. In most large towns the minimum qualification for appointment is six years' continuous practice, and the application must be supported by two barristers, two solicitors and at least six neighbours of the applicant. The charge made by commissioners for taking oaths, declarations, acknowledgments of assignment upon honour is one shilling and sixpence; for marking each exhibit (a document or other thing sworn to in an affidavit and shown to a deponent when being sworn), one shilling.

COMMITMENT, in English law, a precept or warrant in writing, made and issued by a court or judicial officer (including, in cases of treason, the privy council or a secretary of state), directing the conveyance of a person named or sufficiently described therein to a prison or other legal place of custody, and his detention therein for a time specified, or until the person to be detained has done a certain act specified in the warrant, e.g. paid a fine imposed upon him on conviction. Its character will be more easily grasped by reference to a form now in use under statutory authority:—

In the county of A, Petty Sessional Division of B. To each and all of the constables of the county of A and the governor of His Majesty's Prison at C. E. F. hereinafter called the defendant has this day been convicted before the court of summary jurisdiction sitting at D. (Here the conviction and adjudication is stated.)

You the said constables are hereby commanded to convey the defendant to the said prison, and there deliver him to the governor thereof together with this warrant: and you the governor of the said prison to receive the defendant into your custody and keep him to hard labour for the space of three calendar months.

Dated Signature and seal of a justice of the peace.

A commitment as now understood differs from "committal," which is the decision of a court to send a person to prison, and not the document containing the directions to executive and ministerial officers of the law which are consequent on the decision. An interval must necessarily elapse between the decision to commit and the making out of the warrant of commitment, during which interval the detention in custody of the person committed is undoubtedly legal. A commitment differs also from a warrant of arrest (mandat d'amenner), in that it is not made until after the person to be detained has actually appeared, or has been summoned, before the court which orders committal, to answer to some charge.

If not always, at any rate since 1679, a warrant of commitment has been necessary to justify officers of the law in conveying a prisoner to gaol and a gaoler in receiving and detaining him there. It is ordinarily essential to a valid commitment that it should contain a specific statement of the particular cause of the detention ordered. To this the chief, if not the only exception, is in the case of commitments by order of either House of Parliament (May, Parl. Pr., 11th ed., 63, 70, 90). Commitments by justices of the peace must be under their hands and seals. Commitments by a court of record if formally drawn up are under the seal of the court.

Every person in custody is entitled, under the Habeas Corpus Act 1679, to receive within six hours of demand from the officer in whose custody he is, a copy of any warrant of commitment under which he is detained, and may challenge its legality by application for a writ of habeas corpus.

So far as concerns the acts of justices and tribunals of limited jurisdiction, the stringency of the rules as to commitments is an important aid to the liberty of the subject.

In the case of superior courts no statutory forms of commitment exist, and the same formalities are not so strictly enforced. Commitment of a person present in court for contempt of the court is enforced by his immediate arrest by the tipstaff as soon as committed is ordered, and he may be detained in prison on a memorandum of the clerk or registrar of the court while a formal order is being drawn up. And in the case of persons sentenced at assizes and quarter sessions the only written authority for enforcement is a calendar of the prisoners tried, on which the sentences are entered up, signed by the presiding judge.

Commitments are usually made by courts of criminal jurisdiction in respect of offences against the criminal law, but are also occasionally made as a punishment for disobedience to the orders made in a civil court, e.g. where a judgment debtor having means to pay refuses to satisfy the judgment debt, or in cases where the person committed has been guilty of a direct contempt of the court.

The expenses of executing a warrant of commitment, so far as not paid by the prisoner, are defrayed out of the parliamentary grants for the maintenance of prisons.

COMMITTEE (from committe, an Anglo-Fr. past participle of committer, Lat. committere, to entrust; the modern Fr. equivalent commité is derived from the Eng.), a person or body of persons to whom something is "committed" or entrusted. The term is used of a person or persons to whom the charge of the body ("committee of the person") or of the property and business affairs ("committee of the estate") of a lunatic is committed by the court (see Insanity). In this sense the English usage is to pronounce the word commi-ttee. The more common meaning of "committee" (pronounced commit-y) is that of a body of persons elected or appointed to consider and deal with certain matters of business, specially or generally referred to it.

COMMODOIANUS, a Christian Latin poet, who flourished about A.D. 250. The only ancient writers who mention him are Gennadius, presbyter of Massilia (end of 5th century), in his De
scriptorius ecclesiasticus, and Pope Gelasius in De ibris recipiens et non recipiens, in which his works are classed as Apocryphi, probably on account of certain heterodox statements contained in them. Commodianus is supposed to have been an African. As he himself tells us, he was originally a heathen, but was converted to Christianity when advanced in years, and felt called upon to instruct the ignorant in the truth. He was the author of two extant Latin poems, Instructiones and Carmen apologeticum (first published in 1852 by J. B. Pitra in the Spicilegium Solesmense, from a MS. in the Middlehill collection, now at Cheltenham, supposed to have been brought from the monastery of Bobbio). The Instructiones consist of 80 poems, each of which is an acrostic (with the exception of 60, where the initial letters are in alphabetical order). The initials of 80, read backwards, give Commodianus Mendicus Christi. The Apologeticum, undoubtedly by Commodianus, although the name of the author (as well as the title) is absent from the MS., is free from the acrostic restriction. The first part of the Instructiones is addressed to the heathens and Jews, and ridicules the divinities of classical mythology; the second contains reflections on Antichrist, the end of the world, the Resurrection, and advice to Christians, penitents and the clergy. In the Apologeticum all mankind are exhorted to repent, in view of the approaching end of the world. The appearance of Antichrist, identified with Nero and the Man from the East, is expected at an early date. Although they display fiery dogmatic zeal, the poems cannot be considered quite orthodox. To the classical scholar the metre alone is of interest. Although they are professedly written in hexameters, the rules of quantity are sacrificed to accent. The first four lines of the Instructiones may be quoted by way of illustration:

"Praefatio nostra viam erranti demonstrat,
Respectunque bonum, cum venerit seculi meta,
Aeternum heri, quod different interius corda corda
Ego similiter erravi tempore multo."

These versus politici (as they are called) show that the change was already passing over Latin which resulted in the formation of the Romance languages. The use of cases and genders, the construction of verbs and prepositions, and the verbal forms exhibit striking irregularities. The author, however, shows an acquaintance with Latin poets—Horace, Virgil, Lucretius.

The best edition of the text is by B. Dombart (Vienna, 1887), and a good account of the poems will be found in M. Manitius, Geschichte der christlichen Litteratur (1880), 2nd ed. (Biblica und Philologica, which may be added G. Boissier, "Commodien", in the Millententiertert (1887); H. Brewer, Kommodien von Gasa (Paderborn, 1906); H. Verbrugge, La Versification latine populaire en Afrique, in Revue des philologues, xxv. (1911); and C. Dupré, Commodien, Arbeide, Lactancie (1893). Teuffel-Schwebe, Ist. of Roman Literature (Eng. trans., 384), should also be consulted.

COMMODORE (a form of "commander"); in the 17th century the term "commander" was used, a temporary rank in the British navy for an officer in command of a squadron. There are two kinds, one with and the other without a captain below him in his ship, the first holding the temporary rank, pay, &c., of a rear-admiral, the other that of captain. It is also given as a courtesy title to the senior officer of a squadron of more than three vessels. In the United States navy "commodore" was a courtesy title given to captains who had been in command of a squadron. In 1862 it was made a commissioned rank, but was abolished in 1869. The name is given to the president of a yacht club, as of the Royal Yacht Squadron, and to the senior captain of a fleet of merchant vessels.

COMMODUS, LUCIUS AELIUS AURELIUS (161-192), also called Marcus Antoninus, emperor of Rome, son of Marcus Aurelius and Faustina, was born at Lanuvium on the 31st of August 161. In spite of a careful education he soon showed a fondness for low society and amusement. At the age of fifteen he was associated by his father in the government. On the death of Aurelius, whom he had accompanied in the war against the Quadi and Marcomanni, he hastily concluded peace and hurried back to Rome (180). The first years of his reign were uneventful, but in 183 he was attacked by an assassin at the instigation of his sister Lucilla and many members of the senate, which felt deeply insulted by the contemptuous manner in which Commodus treated it. From this time he became tyrannical. Many distinguished Romans were put to death as implicated in the conspiracy, and others were executed for no reason at all. The treasury was exhausted by lavish expenditure on gladiatorial and wild beast combats and on the soldiery, and the property of the wealthy was confiscated. At the same time Commodus, proud of his bodily strength and dexterity, exhibited himself in the arena, slew wild animals and fought with gladiators, and commanded that he should be worshipped as the Roman Hercules. Plots against his life naturally began to spring up. That of his favourite Perennis, praefect of the praetorian guard, was discovered in time. The next danger was from the people, who were infuriated by the death of corn. The mob repelled the praetorian guard, but the execution of the hated minister Clesander quieted the tumult. The attempt also of the daring highwayman Maternus to seize the empire was betrayed; but at last Eutocius, the emperor's chamberlain, Lacteus the praefect of the praetorians, and his mistress Marcia, finding their names on the list of those doomed to death, united to destroy him. He was poisoned, and then strangled by a wrestler named Narcissus, on the 31st of December 192. During his reign unimportant wars were successfully carried on by his generals Claudius Albinus, Pescennius Niger and Ulpius Marcellus. The frontier of Dacia was successfully defended against the Scythians and Sarmatians, and a tract of territory reconquered in north Britain. In 1874 a statue of Commodus was dug up at Rome, in which he is represented as Hercules—a lion's skin on his head, a club in his right hand and the apples of the Hesperides in his left hand.

See Aurelius Lampridius, Herodian, and fragments in Dio Cassius; H. Schiller, Geschichte der römischen Kaiserzeit; J. Zürcher, "Commodi" (1868, in Büdinger's Untersuchungen zur römischen Kaisergeschichte, a criticism of Herodian's account); Pauly-Wissowa, Real-Encyclopädie, ii. 245; F. Rödler, Hesperiden, History der Vaterlandische Literatur des Volks Commodi (Philologus, Supplementband ix.).

COMMON LAW, like "civil law," a phrase with many shades of meaning, and probably best defined with reference to the various things to which it is opposed. It is contrasted with statute law, as law not promulgated by the sovereign body; with equity, as the law prevailing between man and man, unless when the court of chancery assumed jurisdiction; and with local or customary law, as the general law for the whole realm, tolerating variations in certain districts and under certain conditions. It is also sometimes contrasted with civil, or canon, or international law, while the foreign systems recognized in certain special courts of law and within limits defined by the common law. As against all these contrasted kinds of law, it may be described broadly as the universal law of the realm, which applies wherever they have not been introduced, and which is supposed to have a principle for every possible case. Occasionally, it would appear to be used in a sense which would exclude the law developed by all events the more modern decisions of the courts.

Blackstone divides the civil law of England into lex scripta or statute law, and lex non scripta or common law. The latter, he says, consists of (1) general customs, which are the common law strictly so called, (2) particular customs prevailing in certain districts, and (3) laws used in particular courts. The first is the law by which "proceedings and determinations in the king's ordinary courts of justice are guided and directed." That the eldest son alone is heir to his ancestor, that a deed is of no validity unless sealed and delivered, that wills shall be construed more favourably and deeds more strictly, are examples. For common law doctrines, "set down in any written statute or ordinance, but depending on immemorial usage for their support." The validity of these usages is to be determined by the judges—"the depositories of the law, the living oracles who must decide in all cases of doubt, and who are bound by an oath to decide according to the law of the land." Their judgments are preserved as records, and "it is an established rule to abide by former precedents where the same points come again in litigation." The extraordinary deference paid to precedents is the source of the most striking peculiarities of the English common law. There
can be little doubt that it was the rigid adherence of the common law courts to established precedent which caused the rise of an independent tribunal administering justice on more equitable principles—the tribunal of the chancellor, the court of chancery. And the old common law courts—the king's bench, common pleas and exchequer—were always, as compared with the court of chancery, distinguished for a certain narrowness and technicality of reasoning. At the same time the common law was never a fixed or rigid system. In the application of old precedents to the changing circumstances of society, and in the development of new principles to meet new cases, the common law courts displayed an immense amount of subtlety and ingenuity, and a great deal of sound sense. The continuity of the system was not less remarkable than its elasticity. Two great defects of form long disfigured the English law. One was the separation of common law and equity. The Judicature Act of 1873 remedied this by merging the jurisdiction of all the courts in one supreme court, and causing equitable principles to prevail over those of the common law where they differ. The other is the overwhelming mass of precedents in which the law is embedded. This can only be removed by some well-conceived scheme of the nature of a code or digest; to some extent this difficulty has been overcome by such acts as the Sale of Goods Act 1893, the Partnership Act 1890, and the Landlord and Tenant Act 1954. The English common law may be described as a pre-eminently national system. Based on Saxon customs, moulded by Norman lawyers, and jealous of foreign systems, it is, as Bacon says, as mixed as the English language and as truly national. And like the language, it has been taken into other English-speaking countries, and is the foundation of the law in the United States.

COMMON LODGING-HOUSE, "a house, or part of a house, where persons of the poorer classes are received for gain, and in which they use one or more rooms in common with the rest of the inmates, who are not members of one family, whether for eating or sleeping" (Langdon v. Broadbent, 1877, 37 L.T. 434; Booth v. Ferrett, 1890, 25 Q.B.D. 87). There is no statutory definition of the class of houses in England intended to be included in the expression "common lodging-house," but the above definition is very generally accepted as embracing those houses which, under the Public Health and other Acts, must be registered and inspected. The provisions of the Public Health Act 1875 are that every urban and rural district council must keep registers showing the addresses and names of all common lodging-houses in their districts, the situations of the premises, and the number of lodgers authorized by them to be received therein. They may require the keeper to affix and keep undeleted and legible a notice with the words "registered common lodging-house" in some conspicuous place on the outside of the house, and may make by-laws fixing the number of lodgers, for the separation of the sexes, for promoting cleanliness and ventilation, for the giving of notices and the taking of precautions in case of any infectious disease, and generally for the well ordering of such houses. The keeper of a common lodging-house is required to linewash the walls and ceilings twice a year—in April and October—and to provide a proper water-supply. The whole of the house must be open at all times to the inspection of any officer of a council. The county of London (except the city) is under the Common Lodging Houses Acts 1851 and 1853, with the Sanitary Act 1866 and the Sanitary Law Amendment Act 1874. The administration of these acts was, from 1851 to 1894, in the hands of the chief commissioner of police, when it was transferred to the London County Council.

COMMON ORDER BOOK Common Order Books are called The Order of Geneva or Knox's Liturgy, a directory for public worship in the Reformed Church in Scotland. In 1557 the Scottish Protestant lords in council enjoined the use of the English Common Prayer, i.e. the Second Book of Edward VI. Meanwhile, at Frankfurt, among British Protestant refugees, a controversy was going on between the upholders of the English liturgy and the French Reformed Order of Worship respectively. By way of compromise John Knox and other ministers drew up a new liturgy based upon earlier Continental Reformed Services, which was not deemed satisfactory, but which on his removal to Geneva he published in 1556 for the use of the English congregations in that city. The Geneva book made its way to Scotland, and was used there and there by Reformed congregations. Knox's return in 1559 strengthened its position, and in 1562 the General Assembly enjoined the uniform use of it as the "Book of Our Common Order" in "the administration of the Sacraments and solemnization of marriages and burials of the dead." In 1564 a new and enlarged edition was printed in Edinburgh, and the Assembly ordered that "every Minister, exhorter and reader" should have a copy and use the Order contained therein not only for marriage and the sacraments but also "in Prayer," thus ousting the hitherto permissible use of the Second Book of Edward VI. at ordinary service. "The rubrics as retained from the Book of Geneva made provision for an extemporaneous prayer before the sermon, and allowed the minister some latitude in the other two prayers. The forms for the special services were more strictly imposed, but liberty was also given to vary some of the prayers in them. The rubrics of the Scottish portion of the book are somewhat stricter, and, indeed, one or two of the Geneva rubrics were made more absolute in the Scottish condemnations; but no doubt the "Book of Common Order" is best described as a discretionary liturgy.

The English common law may be described as a pre-eminently national system. Based on Saxon customs, moulded by Norman lawyers, and jealous of foreign systems, it is, as Bacon says, as mixed as the English language and as truly national. And like the language, it has been taken into other English-speaking countries, and is the foundation of the law in the United States.
deal of variety at different times and in different localities. Early in the 17th century under the twofold influence of the Dutch Church, with which the Scottish clergy were in close connexion, and of James I's endeavours to "justle out" a liturgy which gave the liberty of "conceiving" prayers, ministers began in prayer to read less and extemporize more.

Turning again to the legislative history, in 1567 the prayers were done into Gaelic; in 1579 parliament ordered all gentlemen and yeomen holding property of a certain value to possess copies. The assembly of 1601 declined to alter any of the existing prayers but expressed a willingness to admit new ones. Between 1606 and 1618 various attempts were made under English and Episcopal influence, by assemblies afterwards declared unlawful, to set aside the "Book of Common Order." The efforts of James I, Charles I, and Archbishop Laud proved fruitless; in 1637 the reading of Laud's draft of a new form of service based on the English prayer book led to riots in Edinburgh and to general discontent in the country. The General Assembly of Glasgow in 1638 abjured Laud's book and took its stand again by the Book of Common Order, an act repealed by the assembly of 1639, which also denounced against innovations proposed by the English separatists, who were then brought together to form a fourth Scottish church, the General or "Covenanting" party, and the minister kneeling for private devotion in the pulpit. An Aberdeen printer named Raban was publicly censured for having on his own authority shortened one of the prayers. The following years witnessed a counter attempt to introduce the Scottish liturgy into England, especially for those who in the southern kingdom were inclined to Presbyterianism. This effort culminated in the Westminster Assembly of divines which met in 1643, at which six commissioners from the Church of Scotland were present, and joined in the task of drawing up a Common Confession, Catechism and Directory for the three kingdoms. The commissioners reported to the General Assembly of 1644 that this Common Directory "is so begun...that we could not think upon any particular Directory for our own Kirk." The General Assembly of 1645 after careful study approved the new order. An act of Assembly on the 3rd of February and an act of parliament on the 6th of February ordered its use in every church, and henceforth, though there was no act setting aside the "Book of Common Order" of the Westminster Directory was at least called a "common place," as if to make known "the general heads, the sense and scope of the Prayers and other parts of Public Worship," and if need be, "to give a help and furniture." The act of parliament recognizing the Directory was annulled at the Restoration and the book has never since been acknowledged by a civil authority in Scotland. But General Assemblies have frequently recommended its use, and worship in Presbyterian churches is largely conducted on the lines of the Westminster Assembly's Directory.

The modern Book of Common Order or Euchologia is a compilation drawn from various sources and issued by the Church of Scotland. Society, an organization which endeavours to promote liturgical usages within the Established Church of Scotland.

**COMMONPLACE**—a translation of the Gr. κοινός τότος, i.e. a passage or argument appropriate to several cases; a "common-place book" is a collection of such passages or quotations arranged for reference under general heads either alphabetically or on some method of classification. To such a book the name adversaria was given, which is an adaptation of the Lat. adversus scriptum, i.e. written on one side of the opposite (adversus), of a paper or book. From its original meaning the word came to be used as meaning something hackneyed, a platitude or truism, and so, as an adjective, equivalent to trivial or ordinary. It was first spelled as two words, then with a hyphen, and so still in the sense of a "common-place book."

**COMMONPLEAS, COURT OF,** formerly one of the three English common law courts at Westminster—the other two being the king's bench and exchequer. The court of common pleas was an offshoot of the Curia Regis or king's council. Previous to Magna Carta, the king's council, especially that portion of it which was charged with the management of judicial and revenue business, followed the king's person. This, as far as private litigation was concerned, caused great inconvenience to the unfortunate suitors whose pleas awaited the attention of the court, for they had, of necessity, also to follow the king from place to place, or lose the opportunity of having their cases tried. Accordingly, Magna Carta enacted that common pleas (commonia placitorum) or causes between subject and subject, should be held in some fixed place and not follow the court. This place was fixed at Westminster. The court was presided over by a chief (capitulis justiciarum de communi banco) and four puisne judges. The jurisdiction of the common pleas was, by the Judicature Act 1873, vested in the king's bench division of the High Court of Justice.

**COMMONS,** the term for the lands held in commonalty, a relic of the system on which the lands of England were for the most part cultivated during the middle ages. The country was divided into vills, or townships—often, though not necessarily, or always, coterminal with the parish. In each stood a cluster of houses, a village, in which dwelt the men of the township, and around the village lay the arable fields and other lands, which they worked as one common stock. The land was enclosed by fences, or--for gardens, orchards and meadows--fencing. The township was free from permanent fencing. The arable lands lay in large tracts divided into compartments or fields, usually three in number, to receive in constant rotation the triennial succession of wheat (or rye), spring crops (such as barley, oats, beans or peas), and fallow. Low-lying lands were used as meadows, and there were sometimes pastures fed according to fixed rules. The poorest land of the township was left waste—to supply feed for the cattle of the community, fuel, wood for repairs, and any other commodity of a renewable or practically inexhaustable character. The waste land is the common of our own days. It would seem likely that at one time there was no division, as between individual inhabitants or householders, of any of the lands of the township, but only of the products. But so far back as accurate information extends the arable land is found to be parcelled out, each householder owning strips in each field. These strips are always long and narrow, and lie in sets parallel with one another. The plough for cultivating the fields was maintained at the common expense of the village, and the draught oxen (one oxen per villein) were maintained by the commoners, and the corn served as manure for the fields. The crops that were grown for the common were wheat, barley, rye, and oats. The time when the crop was carried till the next sowing, the field lay open to the cattle of the whole vill, which also had the free run of the fallow field throughout the year. But when two of the three fields were under crops, and the meadows laid up for hay, it is obvious that the cattle of the township required some other resort for pastureage. This was supplied by the waste or common. Upon it the householder turned out the oxen and horses which he contributed to the plough, and the cows and sheep, which were useful in manuring the common fields,—in the words of an old law case: "horses and oxen to plough the land, and cows and sheep to compester it." Thus the use of the common by each householder was naturally measured by the stock which he kept for the service of the common fields; and when, at a later period, questions arose to the extent of the rights on the common, the necessary practice furnished the rule, that the commoner could turn out as many head of cattle as he could keep by means of the lands which were parcelled out to him,—the rule of levancy and couanchy, which has come down to the present day.

In the earliest post-Conquest times the vill or township is found to be associated with an over-long. There has been much controversy on the question, whether the vill originally owned its lands free from any control, and was subsequently reduced to a state of subjection and to a large extent deprived of its ownership, or whether its whole history has been one of gradual emancipation, the ownership of the waste,  

---

1 For the commons (communitates) in a socio-political sense see Representation and Parliament.  
2 There is an entry on the court rolls of the manor of Wimbledon of the division amongst the inhabitants of the vill of the crab-apples growing on the common.
or common, now ascribed by the law to the lord being a remnant of his ownership of all the lands of the vill. (See Manor.)

At whatever date the over-lord first appeared, and whatever may have been the personal relations of the villagers to him from time to time after his appearance, there can be hardly any doubt that the village lands, whether arable, meadow or waste, were substantially the property of the villagers for the purposes of use and enjoyment. They resorted freely to the common for such purposes as were incident to their system of agriculture, and regulated its use amongst themselves. The idea that the common was the "lord's waste," and that he had the power to do what he liked with it, subject to specific and limited qualifying rules in others, was, there is little doubt, the creation of the Norman lawyers.

One of the earliest assertions of the lord's proprietary interest in waste lands is contained in the Statute of Merton, a statute which, it is well to notice, was passed in one of the first assemblies of the barons of England, before the commons of the realm were summoned to parliament. This statute, which became law in the year 1235, provided that the great men of England (which had enfeoffed knights and their freeholders of small tenements in their great manors) might "make their profit of their lands, wastes, woods and pastures," if they left sufficient pasture for the service of the tenements they had granted. Some fifty years later, another statute, that of Westminster the Second, supplemented the Statute of Merton by enabling the lord of the soil to inclose common lands, not only against his own tenants, but against "neighbours" claiming pasture there. These two pieces of legislation undoubtedly marked the growth of the doctrine which converted the over-lord's territorial sway into property of the modern kind, and a corresponding loosening of the hold of the rural townships on the wastes of their neighbourhood.

To what extent the two acts were used, it is very difficult to say. We know, from later controversies, that they made no very great change in the system on which the country was cultivated, a system to which, as we have seen, commons were essential. In some counties, indeed, inclosures had, by the Tudor period, made greater progress than in others. T. Tusser, in his eulogy on inclosed farming, cites Suffolk and Essex as inclosed counties by way of contrast to Norfolk, Cambridgeshire and Leicestershire, where the open or "champion" (champain) system prevailed. The Statutes of Merton and Westminster may have had something to do with the progress of inclosed farming; but it is probable that their chief operation lay in furnishing the lord of the manor with a farm on the new system, side by side with the common fields, or with a deer park.

The first event which really endangered the village system was the coming of the Black Death. This scourge is said to have swept away half the population of the country. The disappearance, by no means uncommon, of a whole family gave the over-lord of the vill the opportunity of appropriating, by way of escheat, the holding of the household in the common fields. The land-holding population of the townships and the persons interested in the commons were thus sensibly diminished.

During the Wars of the Roses the small cultivator is thought to have again made headway. But his diminished numbers, and the larger interest which the lords had acquired in the lands of each vill, no doubt facilitated the determined attack on the common-field system which marked the reigns of Henry VIII. and Edward VI.

This attack, which had for its chief object the conversion of arable land into pasture for the sake of sheep-breeding, was the outcome of many causes. It was no longer of importance to a territorial magnate to possess a large body of followers pledged to his interests by their connexion with the land. On the other hand, wool commanded a high price, and the growth of towns and of foreign commerce supplied abundant markets. At the same time the confiscation of the monastic possessions introduced a race of new over-lords—not bound to their territories by any family traditions, and also tended to spread the view that the strong hand was its own justification. In order to keep large flocks and send many bales of wool to market, each landowner strove to increase his range of pasture, and with this view to convert the arable fields of his vill into grass land. There is abundant evidence both from the complaints of writers such as Latimer and Sir Thomas More, and from the Statutes and royal commissions of the day, that large inclosures were made at this time, and that the process was effected with much injustice and accompanied by great hardship. "Where," says Bishop Latimer in one of his courageous and vigorous denunciations of "inclosers and rent-raisers," "there have been many householders and inhabitants, there is now but a shepherd and his dog." In the full tide of this movement, and despite Latimer's appeals, the Statutes of Merton and Westminster the Second were confirmed and re-enacted. Both common fields and commons no doubt disappeared in many places; and the country saw the first notable instalment of inclosure. But from the evidence of later years it is clear that a very large area of the country was still cultivated on the common-field system for another couple of centuries. When inclosure on any considerable scale again came into favour, it was effected on quite different principles; and before describing what was essentially a modern movement, it will be convenient to give a brief outline of the principles of law applicable to commons at the present day.

Rights of common. — The distinguishing feature in law of common land is, that it is land the soil of which belongs to one person, and from which certain others persons take certain profits—for example, the bite of the grass by the mouth of cattle, or gorse, bushes or heather for fuel or litter. The right to take such a profit is a right of common; the right to feed cattle on common land is a right of common of pasture; while the right of cutting bushes, gorse or heather (more rarely of lopping trees) is known as a right of common of estovers (estouwiers) or botes (respectively from the Norman-French estouffer, and the Saxon botan, to furnish). Another right of common is that of turbary, or the right to cut turf or peat for fuel. There are also rights of taking sand, gravel or loam for the repair and maintenance of land. The persons who enjoy any of these rights are called commoners.

From the sketch of the common-field system of agriculture which has been given, we shall readily infer that a large proportion of the commons of the country, and of the peculiarities of the law relating to commons, are traceable to that system. Thus, common rights are mostly attached to, or enjoyed with, certain lands or houses. A right of common of pasture usually consists of the right to turn out as many cattle as the farm or other private land of the commoner can support in winter; for, as we have seen, the enjoyment of the common, in the village system, belonged to the householder of the village, and was necessarily measured by their holdings in the common fields. The cattle thus commonable are said to be leuant and couchant, i.e. uprising and down-lying on the land. But it has now been decided that they need not in fact be so kept. At the present day a commoner may turn out any cattle belonging to him, wherever they are kept, provided they do not exceed in number the head of cattle which can be supported by the stored summer pasture of the land. If the rights are claimed, together with any winter herbage it is necessary that the animals which a commoner may usually turn out are those which were employed in the village system—horses, oxen, cows and sheep. These animals are termed commonable animals. A right may be claimed for other animals, such as donkeys, pigs and geese; but they are termed non-commonable, and the right can only be established on proof of special usage. A right of pasture attached to land in the way we have described is said to be appendant or appurtenant to such land. Common of pasture appendant to land can only be claimed for commonable cattle; and it is held to have been originally attached only to arable land, though in claiming the right no proof that the land was originally arable is necessary. This species of common right is, in fact, the direct survival of the use by the village householder of the common of the township; while common of pasture appurtenant...
represents rights which grew up between neighbouring townships, or, in later times, by direct grant from the owner of the soil of the common to some other landowner, or (in the case of copyholders) by local custom.

The characteristic of connexion with house or land also marks other rights of common. Thus a right of taking gorse or bushes, or of lopping wood for fuel, called fire-bate, is limited to the taking of such fuel as may be necessary for the hearths of a particular house, and no more may be taken than is thus required. The same condition applies to common of turbary, which in its more usual form authorizes the commoner to cut the heather, which grows thickly upon poor soils, with the roots and adhering earth, to a depth of about 9 in. Similarly, wood taken for the repairs of buildings (house-bate), or of hedges (hedge-bate or key-bate), must be limited in quantity to the requirements of the house, farm buildings and hedges of the particular property to which the right is attached. And heather taken for litter cannot be taken in larger quantities than is necessary for manuring the lands in respect of which the right is enjoyed. It is illegal to take the wood or heather from the common, and to sell it to any one who has not himself a right to take it. So, also, a right of digging sand, gravel, clay or loam is usually appurtenant to land, and must be exercised with reference to the repair of the roads, or the improvement of the soil, of the particular property to which the right is attached.

We have already alluded to the fact that, in Norman and later days, every vill or township was associated with some over-lord,—some one responsible to the crown, either directly or through other superior lords, for the holding of the land and the performance of certain duties of defence and military support. To this lord the law has assigned the ownership of the soil of the common of the vill; and the common has for many centuries been styled the waste of the manor. The trees and bushes on the common belong to the lord, subject to any rights of lopping or cutting which the commoners may possess. The ground, sand and subsoil are his, and even the grass, though the commoners have the right to take it by the mouths of their cattle. To the over-lord, also, was assigned a seignory over all the other lands of the vill; and the vill came to be termed his manor. At the present day it is the manorial system which must be invoked in most cases as the foundation of the curiously conflicting rights which co-exist on a common. (See Manor.)

Within the bounds of a manor, speaking generally, there are three classes of persons possessing an interest in the land, viz.:—

(a) Persons holding land freely of the manor, or freehold tenants.
(b) Persons holding land of the manor by copy of court roll, or copyhold tenants.
(c) Persons holding from the lord of the manor, by lease or agreement, or from year to year, land which was originally demesne, or which was once freehold or copyhold and has come into the lord's hands by escheat or forfeiture.

Amongst the first two classes we usually find the majority of the tenants on the wastes or commons of the manor. To every freehold tenant belongs a right of common of pasture on the commons, such right being "appendant" to the land which he holds freely of the manor. This right differs from most other rights of common in the characteristic that actual exercise of the right need not be proved. When once it is shown that certain land is held freely of the manor, it follows of necessity that a right of common of pasture for commonable cattle attaches to the land, and therefore belongs to its owner, and may be exercised by its occupant. "Common appendant," said the Elizabethan judges, "is of common right, and commences by operation of law and in favour of tillage."

Now this is exactly what we saw to be the case with reference to the use of the common of the vill by the householder cultivating the arable fields. The use was a necessity, not depending upon the habits of this or that householder; it was a use for commonable cattle only, and was connected with the tillage of the arable lands. It seems almost necessarily to follow that the freehold tenants of the manor are the representatives of the householders of the vill. However this may be, it is amongst the freehold tenants of the manor that we must first look for commoners on the waste of the manor.

Owing, however, to the light character of the services rendered by the freeholders, the connexion of their lands with the manor is often difficult to prove. Copyhold tenure, on the other hand, cannot be lost sight of; and in many manors copyholders are numerous, or were, till quite recently. Copyholders almost invariably possess a right of common on the waste of the manor; and when (as is usual) they exist side by side with freeholders, their rights are generally of the same character. They do not, however, exist as of common right, without proof of usage, but by the custom of the manor. Custom has been defined by a great judge (Sir George Jessel, M.R., in Hammerton v. Heney) as local law. Thus, while the freehold tenants enjoy their rights by the general law of the land, the copyholders have a similar enjoyment by the local law of the manor. This, again, is what one might expect from the ancient constitution of a village community. The copyholders, being originally serfs, had no rights at law; but as they had a share in the tillage of the land, and gradually became possessed of strips in the common fields, or of other plots on which they were settled by the lord, they were admitted by way of indulgence to the use of the common; and the practice hardened into a custom. As might be expected, there is more variety in the details of the rights they exercise. They may claim common for cattle which are not commonable, if the custom extends to such cattle; and their claim is not necessarily connected with arable land.

In the present day large numbers of copyhold tenements have been enfranchised, i.e. converted into freehold. The effect of this step is to sever all connexion between the land enfranchised and the manor of which it was previously held. Technically, therefore, the common rights previously enjoyed in respect of the land would be gone. When, however, there is no indication of any intention to extinguish such rights, the courts protect the copyholders in their continued enjoyment; and when an enfranchisement is effected under the statutes passed in modern years, the rights are expressly preserved. The commoners on a manorial common then will be, prima facie, the freeholders and copyholders of the manor, and the persons who own lands which were copyhold of the manor but have been enfranchised.

The occupants of lands belonging to the lord of the manor, though they usually turn out their cattle on the common, do so by virtue of the lord's ownership of the soil of the common, and can, as a rule, make no claim to any right of common as against the lord, even though the practice of turning out may have obtained in respect of particular lands for a long series of years. When, however, lands have been sold by the lord of the manor, although no right of common attached by law to such lands in the lord's hands, their owners may subsequently enjoy such a right, if it appears from the language of the deeds of conveyance, and all the surrounding circumstances, that there was an intention that they should be enjoyed by the purchaser. The rules of evidence are not very technical; it is sufficient here to indicate that lands bought from a lord of a manor are not necessarily destitute of common rights.

So far we have considered common rights as they have arisen out of the manorial systenm, and out of the still older system of village communities. There may, however, be rights of common quite unconnected with the manorial system. Such rights may be proved either by producing a specific grant from the owner of the manor or by long usage. It is seldom that an actual grant is produced, although it would seem likely that such grants were not uncommon at one time. But a claim founded on actual use is by no means unusual. Such a claim may be based (a) on immemorial usage, i.e. usage for which no commencement later than the coronation of Richard I. (1189) can be shown, (b) on a presumed modern grant which has been lost, or (c) (in some cases) on the Prescription Act 1832. There are special rules applicable to each kind of claim.
A right of common not connected with the manorial system may be, and usually is, attached to land; it may be measured, like a manorial right, by levancy and coushancy, or it may be limited to a fixed number of animals. Rights of the latter character seem to have been not uncommon in the middle ages. In one of his sermons against inclosure, Bishop Latimer tells us his father "had walk (i.e. right of common) for 100 sheep." This may have been a right in gross, but was more probably attached to the "farm of £3 or £4 by year at the uttermost" which his father held. A right of common appurtenant may be sold separately, and enjoyed by a purchaser independently of the tenement to which it was originally appurtenant. It then becomes a right of common in gross.

A right of common in gross is a right enjoyed irrespective of the ownership or occupancy of any lands. It may exist by express grant, or by user implying a modern lost grant, or by immemorial usage. It must be limited to a certain number of cattle, unless the right is claimed by actual grant. Such rights seldom arise in connexion with commons in the ordinary sense, but are a frequent incident of regulated or stinted pastures; the right is then generally known as a cattle-gate or beast-gate.

There may be rights over a common which exclude the owner of the soil from all enjoyment of some particular product of the common; thus a person, or a class of persons, may be entitled to use the whole of the commons, grass, underwood, or whatever else (everything which falls to the sweep of the scythe) of a tract of land, without possessing any ownership in the land itself, or in the trees or mines. Such a right is known as a right of sole vesture.

A more limited right of the same character is a right of sole pasturage—the exclusive right to take everything growing on the land in question by the mouths of cattle, but not in any other way. Either of these rights may exist throughout the whole year, or during part only. A right of sole common pasturage and herbage was given to a certain class of commoners in Ashdown Forest on the partition of the forest at the end of the 18th century.

We have seen that the common arable fields and common meadows of a vill were thrown open to the stock of the community between harvest and seed-time. There is still to be found, here and there, a group of arable common fields, and occasionally a piece of grass land with many of the characteristics of a common, which turns out to be a common field or meadow. The Hackney Marshes and the other so-called commons of Hackney are really common fields or common meadows. In the days when a constant succession of such meadows is met with. They are still owned in parcels marked by metes; the owners have the right to grow a crop of hay between Lady day and Lammas day; and from Lammas to March the lands are subject to the depasturage of stock. In the case of some common fields and meadows the right of feed during the open time belongs exclusively to the owners; in others to a larger class, such as the owners and occupiers of all lands within the bounds of the parish. Anciency, as we have seen, the two classes would be identical. In some places newcomers not owning strips in the fields were admitted to the right of turn out; in others, not. Hence the distinction. Similar divergences of practice will be found to exist in Switzerland at the present day; nieder-gelassene, or newcomers, are in some communes admitted to all rights, while, in others, privileges are reserved to the burger, or old inhabitant householders.

Some of the largest tracts of waste land to be found in England are the waste or commonable lands of royal forests or chases. The thicket and pastures of Epping Forest, now happily preserved for London under the guardianship of the city corporation, and the noble wood and far-stretching heaths of the New Forest, will be called to mind. Cannock Chase, unhappily inclosed according to law, though for the most part still lying waste, Dartmoor, and Ashdown Forest in Sussex, are other instances; and the list might be greatly lengthened. Space will not permit of any description of the forest system; it is enough, in this connexion, to say that the common rights in a forest were usually enjoyed by the owners and occupiers of land within its bounds (the class may differ in exact definition, but is substantially equivalent to this) without reference to manorial considerations. Epping Forest was saved by the proof of this right. It is often said that the right was given, or confirmed, to the inhabitants in consideration of the burden of supporting the deer for the pleasure of the king or of the owner of the chase. It seems more probable that the forest law prevented the growth of the manorial system, and with it those rules which have tended to restrict the class of persons entitled to enjoy the waste lands of the district.

We have seen that in the case of each kind of common there is a division of interest. The soil belongs to one person; other persons are entitled to take certain products of the soil. This division of interest preserves the common as an open space. The commoners cannot inclose, because the land does not belong to them. The owner of the soil cannot inclose, because inclosure is inconsistent with the enjoyment of the commoners' rights. At a very early date it was held that the right of a commoner proceeded out of every part of the common, so that the owner of the soil could not set aside part for the commoner and inclose the rest. The Statutes of Merton and Westminster the Second were passed to get over this difficulty. But under these statutes it was provided that if sufficient pasture was left upon the owner of the soil; such proof can very seldom be given. Moreover, the statutes have never enabled an inclosure to be made against commoners entitled to estovers or turbary. It seems clear that the statutes had become obsolete in the time of Edward VI., or they would not have been re-enacted. And we know that the zealous advocates of inclosure in the 18th century considered them worthless for their purposes. Practically it may be taken that, save where the owner of the soil of a common acquires all the lands in the township (generally coterminous with the parish) with which the common is connected, an inclosure cannot legally be effected by him. And even in the latter case it may be that rights of common are enjoyed in respect of lands outside the parish, and that such rights prevent an inclosure.

Modern Inclosure.—When, therefore, the common-field system began to fall out of gear, and the increase of population brought about a demand for an increased production of corn, it was felt to be necessary to resort to parliament for power to effect inclosure. The legislation which ensued was based on two principles. One was that an open land to be dealt with should receive a proportionate equivalent in inclosed land; the other, that inclosure should not be prevented by the opposition, or the inability to act, of a small minority. Assuming that inclosure was desirable, no more equitable course could have been adopted, though in details particular acts may have been objectionable. The first act was passed in 1709; but the precedent was followed but slowly, and not till the middle of the 18th century did the annual number of acts attain double figures. The high-water mark was reached in the period from 1765 to 1785, when an average forty-seven acts were passed every year. From some cause, possibly the very considerable expense attending upon the obtaining of an act, the numbers then began slightly to fall off. In the year 1793 a board of agriculture, apparently similar in character to the chambers of commerce of our own day, was established. Sir John Sinclair was its president, and Arthur Young, the well-known agricultural reformer, was its secretary. Owing to the efforts of this body, and of a select committee appointed by the House of Commons on Sinclair's motion, the first General Inclosure Act was passed in 1801. This act would at the present day be called an Inclosure Clauses Act. It contained provisions applicable to inclosures, which could be incorporated by reference, in a private bill. By this means, it was hoped, the length and complexity, and consequently the expense, of inclosure bills would be greatly diminished. Under the stimulus thus applied inclosure proceeded apace. In the year 1801 no less than 119 acts were passed, and the total
area inclosed probably exceeded 300,000 acres. Three inclosures in the Lincolnshire Fens account for over 53,000 acres. As before, the movement after a time spent its force, the annual average of acts falling to about twelve in the decade 1830-1840. Another parliamentary committee then sat to consider how inclosure might be promoted; and the result was the Inclosure Act 1845, which, though much amended by subsequent legislation, still stands on the statute-book. The chief feature of that act was the appointment of a permanent commission to make in each case all the inquiries previously made (no doubt capriciously and imperfectly) by committees of the two Houses. The commission, on being satisfied of the propriety of an inclosure, was to draw up a provisional order prescribing the general conditions on which it was to be carried out, and this order was to be submitted to parliament by the government of the day for confirmation. It is believed that these inclosure orders afford the first example of the provisional order system of legislation, which has attained such large proportions.

Again inclosure moved forward, and between 1845 and 1869 (when it received a sudden check) 600,000 acres passed through the hands of the inclosure commission. Taking the whole period of about a century and a half, when parliamentary inclosure was in favour, and making an estimate of acreage where the acts do not give it, the result may be thus summarized:

<table>

The total area of England being 37,000,000 acres, we shall probably not be far wrong in concluding that about one acre in every seven was inclosed during the period in question. During the first period, the lands inclosed consisted mainly of common arable fields; during the second, many great tracts of moor and fen were reduced to severalty ownership. In the third period, inclosure probably related chiefly to the ordinary manorial common; and it seems likely that, on the whole, England would have gained, had inclosure stopped in 1845.

As a fact it stopped in 1860. Before the inclosure commission had been in existence twenty years the feeling of the nation towards commons began to change. The rapid growth of towns, and especially of London, and the awakening sense of the importance of protecting the public health, brought about an appreciation of the value of commons as open spaces. Naturally, the metropolis saw the birth of this sentiment. An attempted inclosure in 1846 of the commons at Epsom and Wimbledon aroused strong opposition; and a select committee of the House of Commons was appointed to consider how the London commons could best be preserved. The Metropolitan Board of Works, then in the vigour of youth, though eager to become the open-space authority for London, could make no better suggestion than that all persons interested in the commons should be bought out, that the board should defray the expense by selling parts for building, and should make parks of what was left. Had this advice been followed, London would probably have lost two-thirds of the open space which she now enjoys. Fortunately a small knot of men, who afterwards formed the Commons Preservation Society, took a broader and wiser view. Chief amongst them were the late Philip Lawrence, who acted as solicitor to the Wimbledon opposition, and subsequently organized the Commons Preservation Society, George Shaw-Leefevre, chairman of that society since its foundation, the late John Locke, and the late Lord Mount Temple (then Mr W. F. Cowper). They urged that the conflict of legal interests, which is the special characteristic of a common, might be trusted to preserve it as an open space, and that all that parliament could usefully do, was to restrict parliamentary inclosure, and to pass a measure of police for the protection of commons as open spaces. The select committee adopted this view. On their report, was passed the Metropolitan Commons Act 1866, which prohibited any further parliamentary inclosures within the metropolitan police area, and provided means by which a common could be put under local management. The lords of the manors in which the London commons lay felt that their opportunity of making a rich harvest out of land, valuable for building, though otherwise worthless, was slipping away; and a battle royal ensued. Inclosures were commenced, and the Statute of Merton prayed in aid. The public retorted by legal proceedings taken in the names of commons. These proceedings—which culminated in the mammoth suit as to Epping Forest, with the corporation of London as plaintiffs and fourteen lords of manors as defendants—were uniformly successful; and London commons were saved. By degrees the manorial lords, seeing that they could not hope to do better, parted with their interest for a small sum to some local authority; and a large area of the common land, not only in the county of London, but in the suburbs, is now in the hands of the representatives of the ratepayers, and is definitely appropriated to the recreation of the public.

Moreover, the Commons Preservation Society was able to base, upon the uniform success of the commons in the law courts, a plea for the amendment of the law. The Statute of Merton, we have seen, purports to enable the lord of the soil to inclose a common, if he leaves a sufficient pasture for the commons. This statute was constantly vouched in the litigation about London commons; but in no single instance was an inclosure justified by virtue of its provisions. It thus remained a trap to lords of manors, and a source of controversy and expense. In the year 1893 Lord Thring, at the instance of the Commons Preservation Society, carried through parliament the Commons Law Amendment Act, which provided that in future no inclosure under the Statute of Merton should be valid, unless made with the consent of the Board of Agriculture, which was to consider the expediency of the inclosure from a public point of view.

The movement to preserve commons as open spaces soon spread to the rural districts. Under the Inclosure Act 1845 provision was made for the allotment of a part of the land to be inclosed for field gardens, recreation, or poor, and for recreation. But those who were interested in effecting an inclosure often convinced the inclosure commissioners that for some reason such allotments would be useless. To such an extent did the reservation of such allotments become discredit that, in 1869, the commission proposed to parliament the inclosure of 13,000 acres, with the reservation of only one acre for recreation, and none at all for field gardens. This proposal attracted the attention of Henry Fawcett, who, after much inquiry and consideration, came to the conclusion that inclosures were, speaking generally, doing more harm than good to the agricultural labourer, and that, under such conditions as the commissioners were prescribing, they constituted a serious evil. With characteristic intrepidity he opposed the annual inclosure bill (which had come to be considered a mere form) and moved for a committee on the whole subject. The ultimate result was the passing, seven years later, of the Commons Act 1876. This measure, provoked by a Conservative government, laid down the principle that an inclosure should not be adopted unless distinctly shown to be for the benefit, not merely of private persons, but of the neighbourhood generally and the public. It imposed many checks upon the process, and following the course already adopted in the case of metropolitan commons, offered an alternative method of making commons more useful to the nation, viz. their management and regulation as open spaces. The effect of this legislation and of the changed attitude of the House of Commons towards inclosure has been almost to stop that process, except in the case of common fields or extensive mountain wastes.

We have alluded to the regulation of commons as open spaces. The primary object of this process is to bring a common under the jurisdiction of some constituted authority, which may make by-laws, enforceable in a summary way before the magistrates of the district, for its protection, and may appoint watchers or keepers to preserve order and prevent wanton mischief. There are several means of obtaining
COMMONWEALTH—COMMUNE, MEDIEVAL

this object. Commonws within the metropolitan police district—
the Greater London of the registrar-general—are in this respect
in a position by themselves. Under the Metropolitan Commons
Acts, schemes for their local management may be made by the
Board of Agriculture (in which the inclosure commission is now
merged) without the consent either of the owner of the soil or
the commoners—who, however, are entitled to compensation
if they can show that they are injuriously affected. Outside
the metropolitan police district a provisional order for regulation
may be made under the Commons Act 1876, with the consent of
the owner of the soil and of persons representing two-thirds
in value of all the interests in the common. And under an act
passed in 1899 the council of any urban or rural district may,
with the approval of the Board of Agriculture and without
recourse to parliament, make a scheme for the management of
any common within its district, provided no notice of dissent is
served on the board by the lord of the manor or by persons
representing one-third in value of such interests in the common
as are affected by the scheme. There is yet another way of
protecting a common. A parish council may, by agreement,
acquire an interest in it, and may make by-laws for its
regulation under the Local Government Act 1894. The acts of
1894 and 1899 undoubtedly proceed on right lines. For,
with the growth of efficient local government, commons naturally
fall to be protected and improved by the authority of the
district.

It remains to say a word as to the extent of common land
still remaining open in England and Wales. In 1843 it was
estimated that there were still 10,000,000 acres of
common land and common-field land. In 1874 another
return made by the inclosure commission made a guess of 2,632,772.
These two returns were made from the same materials, viz.
the tithe commutation awards. As less than 700,000 acres had
been inclosed in the intervening period, it is obvious that the
two estimates are mutually destructive. In July 1875 another
version was given in the Return of Landowners (generally
known as the Modern Domesday Book), compiled from the
valuation lists made for the purposes of rating. This return
put the commons of the country (not including common fields)
at 1,542,648 acres. It is impossible to view any of these returns
as accurate. Those compiled from the tithe commutation awards
are based largely on estimates, since there are many parishes
where the tithes had not been commuted. On the other hand,
the valuation lists do not show waste and unoccupied land
(which is not rated), and common land has been included in such
lands in the Return of Landowners was based on any
materials which might happen to be at the disposal of the clerk
of the guardians. All we can say, therefore, is that the acreage
of the remaining common land of the country is probably
somewhere between 1,500,000 and 2,000,000 acres. It is most
capriciously distributed. In the Midlands there is very little
to be found, while in a county of poor soil, like Surrey, nearly
every parish has its common, and there are large tracts of heath
and moor. In 1866, returns were made to parliament by the
overseers of the poor of the commons within 15 and within 25 m.
of Charing Cross. The acreage within the larger area was put
at 38,450 acres, and within the smaller at 13,301; but owing
to the difference of opinion which sometimes prevails upon the
question, whether land is common or not, and the carelessness
of some parish authorities as to the accuracy of their returns,
even these figures cannot be taken as more than approximately
correct. The metropolitan police district, within which the
Metropolitan Commons Acts are in force, approaches in extent
to a circle of 15 miles' radius. Within this district nearly
12,000 acres of common land have been put under local manage-
ment, either by means of the Commons Acts or under special
legislation. London is fortunate in having secured so much
recreation ground on its borders. But when the enormous
population of the capital and its rapid growth and expansion
are considered, the conclusion is inevitable, that not one acre
of common land within an easy railway journey of the metropoli-
can be spared.

COMMONWEALTH, a term generally synonymous with
commonweal, i.e. public welfare, but more particularly signifying
a form of government in which the general public have a direct
voice. “The Commonwealth” is used in a special sense to
denote the period in English history between the execution of
Charles I. in 1649 and the Restoration in 1660. Commonwealth
is also the official designation in America of the states of Massa-
echusets, Pennsylvania, Virginia and Kentucky. The Common-
wealth of Australia is the title of the federation of Australian
colonies carried out in 1900.

COMMUNE, Med. Lat. communia, Lat. commüinis, comon),
in its most general sense, a group of persons acting together
for purposes of self-government, especially in towns. (See
Borough, and COMMON, MEDIEVAL, below.) “Commune” (Fr.
commune, Ital. commune, Ger. Gemeinde, &c.) is now the term
generally applied to the smallest administrative division in many
European countries. (See the sections dealing with the administration
of these countries under their several headings.) “The Commune”
is the name given to the period of the history of Paris from
March 18 to May 28, 1871, during which the commune of Paris
attempted to set up its authority against the National Assembly
at Versailles. It was a political movement, intended to replace
the centralized national organization by one based on a
federation of communes. Hence the “communists” were also called
“federalists.” It had nothing to do with the social theories
of Communism (q.v.). (See FRANCE: History.)

COMMUNE, MEDIEVAL. Under this head it is proposed to
give a short account of the rise and development of towns in
central and western continental Europe since the downfall of
the Roman Empire. All these, including also the British towns
(for which, however, see Borough), may be said to have formed
one society, or at least, as much as all arose under similar conditions,
economic, legal and political, irrespective of local peculiarities.
Kindred economic conditions prevailed in all the former
provinces of the Western empire, while new law concepts were
everywhere introduced by the Germanic invaders. It is largely
for the latter reason that it seems advisable to begin with an account
of the German towns, the term German to correspond to the limits of
the old kingdom of Germany, comprising the present empire, German
Austria, German Switzerland, Holland and a large portion of
Belgium. In their development the problem, as it were, worked
out least tainted by foreign interference, showing at the same
time a rich variety in detail; and it may also be said that their
constitutional and economic history has been more thoroughly
investigated than any other.

Like the others, the German towns should be considered from
three points of view, viz. as jurisdictional units, as self-admim-
istrative units and as economic units. One of the chief distinguis-
ishing features of early as opposed to modern town-life is that
each town formed a jurisdictional district distinct from the
country around. Another trait, more in accordance with the condi-
tions of to-day, is that local self-government was more fully developed
and strongly marked in the towns than without. And, thirdly,
each town in economic matters (often as independent
as possible of that of any other town or of the country in general.
The problem is, how this state of things arose.

From this point of view the German towns may be divided into
two main classes: those that gradually resuscitated on the ruins
of former Roman cities in the Rhine and Danube countries, and
those that were newly founded at a later date in the interior.\(^1\) Foremost in importance among the former stand the episcopal cities. Most of these had never been entirely destroyed during the Germanic invasion. Roman civic institutions perished; but probably parts of the population survived, and small Christian congregations with their bishops in most cases seem to have weathered all storms. Much of the city walls presumably remained standing, and within them German communities soon settled.

In the 10th century it became the policy of the German emperors to hand over to the bishops full jurisdictional and administrative powers within their cities. The bishop henceforward directly or indirectly appointed all officers for the town’s government. The chief of these was usually the advocatus or Vogt, some neighbouring noble who served as the proctor of the church in all secular affairs. It was his business to preside three times a year over the chief law-court, the so-called echte or angebotene Ding, under the cognizance of which fell all cases relating to real property, personal freedom, bloodshed and robbery. For the rest of the legal business and as president of the ordinary court he appointed a Schultheiss, centenarius or considicis. Other officers were the Burggraf\(^2\) or prospectus for military matters, including the preservation of the town’s defences, walls, moats, bridges and streets, as well as the tax collectors and the craft-gilds in matters relating to their crafts; further, the customs-officer or telemarius and the mint-master or monetae magister. It was not, however, the fact of their being placed under the bishop that constituted these towns as separate jurisdictional units. The chief feature rather is the existence within their walls of a special law, distinct in important points from that of the country at large. The towns enjoyed a special peace, as it was called, i.e. breaches of the peace were more severely punished if committed in a town than elsewhere. Besides, the inhabitants might be sued before the town court only, and to fugitives from the country who had taken refuge in the town belonged a similar privilege. This special legal status probably arose from the towns being considered in the first place as the king’s fortresses\(^3\) or burhs (see borough), and, therefore, as participating in the special peace enjoyed by the king’s palace. Hence the terms “burgh,” “borough” in English, burghs in Gothic, the earliest Germanic designations for a town; “burg,” “burg,” “burgess” for its inhabitants. What struck the townless early Germans most about the Roman towns was their mighty walls. Hence they applied to all fortified habitations, of whatever nature, the title “burg.” Likewise, the walls remained with them the main feature distinguishing a town from a village; and the fact of the town being a fortified place likewise necessitated the special provisions mentioned for maintaining the peace.

The new towns in the interior of Germany were founded on land belonging to the founder, some ecclesiastical or lay lord, and frequently adjoining the cathedral close of one of the new sees or the lord’s castle, and they were laid out according to a regular plan. The most important feature was the market-square, often surrounded by arcades with stalls for the sale of the principal commodities, and with a number of straight streets leading thence to the city gates.\(^4\) As for the fortifications, some time naturally passed before they were completed. Furthermore, the governmental machinery would be less complex than in the older towns. The legal peculiarities distinguishing town and country, on the other hand, may be said to have been conferred

COMMUNE, MEDIEVAL

of its by-laws. Thus it assumed a jurisdiction, partly concurrent with that of the lord, which it further extended to breaches of the peace. And, finally, it raised funds by means of an excise-duty, Ungeld (cf. the English maltola) or Accise, Zeise. In the older and larger towns it soon went beyond what the bishops thought proper to tolerate; conflicts ensued; and in the 13th century several bishops obtained decrees in the imperial court, either to suppress the Rat altogether, or to make it subject to their nomination, and more particularly to abolish the Ungeld, as detrimental to episcopal finances. In the long run, however, these attempts proved of little avail.

Meanwhile the tendency towards self-government spread even to the lower ranks of town society, resulting in the establishment of craft-gilds. From a very early period there is reason to believe merchants among themselves formed gilds for social and religious purposes, and for the furtherance of their economic interests. These gilds would, where they existed, no doubt also influence the management of town affairs; but nowhere has the Rat, as used to be thought, developed out of a gild, nor has the latter anywhere in Germany played a part at all similar in importance to that of the English gild merchant, the only exception being for a time the Richerzeche, or Gild of the Rich of Cologne, from early times by far the largest, the richest, and the most important trading centre among German cities, and therefore provided with an administration more complex, and in some respects more primitive, than any other. On the other hand, the most important commodities offered for sale in the market had been subject to official examination already in Carolingian times. Bakers', butchers', shoemakers' stalls were grouped together in the market-place to facilitate control, and with the same object in view a master was appointed for each craft as its responsible representative. By and by these crafts or "offices" claimed the right of electing their master and of assisting him in examining the goods, and even of framing by-laws regulating the quality of the wares and the process of their manufacture. The bishops at first resented these attempts at self-management, as they had done in the case of the town council, and imperial legislation in their interests was obtained. But each craft at the same time formed a society for social, beneficial and religious purposes, and, as these were entirely in accordance with the wishes of the clerical authorities, the other powers could not in the long run be withheld, including that of forcing all followereis of any craft to join the gild (Zunftzwang). Thus the official inspection of markets, community of interests on the part of the craftsmen, and co-operation for social and religious ends, worked together in the formation of craft-gilds. It is not suggested that in each individual town the rise of the gilds was preceded by an organization of crafts on the part of the lord and his officers; but it is maintained that as a general thing voluntary organization could hardly have proceeded on such orderly lines as on the whole it did, unless the framework had in the first instance been laid down by the authorities: much as in modern times the working together in factories has practically been an indispensable preliminary to the formation of trade unions. Much less would the principle of forced entrance have found such ready acceptance both on the part of the authorities and on that of the men, unless it had previously been in full practice and recognized under the system of official market-control. The different names for the societies, viz. fraternitas, Brüderschaft, officium, Amt, conditum, Zunft, unio, Innung, do not signify different kinds of societies, but only different aspects of the same thing. The word Gilde alone forms an exception, inasmuch as, generally speaking, it was used by merchant gilds only.¹

From an early date the towns, more particularly the older episcopal cities, took a part in imperial politics. Legally the bishops were in their cities mere representatives of the imperial government. This fact found formal expression mainly in two ways. The Voge, although appointed by the bishop, received the "ban," i.e. the power of having justice executed, which he passed on to the lesser officers, from the king or emperor directly. Secondly, whenever the emperor held a curia generalis (or general assembly, or diet) in one of the episcopal cities, and for a week before and after, all jurisdictional and administrative power reverted to him and his immediate officers. The citizens on their part clung to this connexion and made use of it whenever their independence was threatened by their bishops, who strongly inclined to consider themselves lords of their cathedral cities, much as if these had been built on church-lands. As early as 1073, therefore, we find the citizens of Worms successfully resisting against their bishop in order to provide the emperor Henry IV. with a refuge against the rebellious princes. Those of Cologne made a similar attempt in 1074. But a second class of imperial cities (Reichsstädte), much more numerous than the former, consisted of those founded on demesne-land belonging either to the Empire or to one of the families who rose to imperial rank. This class was largely reinforced, when after the extinction of the royal house of Hohenstaufen in the 13th century, a great number of towns founded by them on their demesne successfully claimed immediate subjectation to the crown. About this time, during the interregnum, a federation of more than a hundred towns was formed, beginning on the Rhine, but extending all the way to the north, Zürich in the south, and Regensburg in the east, with the object of preserving the peace. After the death of King William in 1258, they resolved to recognize no king unless unanimously elected. This league was joined by a powerful group of princes and nobles and found recognition by the prince-electors of the Empire; but for want of leadership it did not stand the test, when Richard of Cornwall and Alphonsio of Castile were elected rival kings in 1257.² In the following centuries the imperial cities in southern Germany, where most of them were situated, repeatedly formed leagues to protect their interests against the power of the princes and the nobles, and destructive wars were waged; but no great political issue found solution, the relative position of the parties after each war remaining much what it had been before. On the part of the towns this was mainly due to lack of leadership and of unity of purpose. At the time of the Reformation the imperial towns, like most of the others, stood forward as champions of the new cause and did valuable service in upholding and defending it. After that, however, their political part was played out, mainly because they proved unable to keep up with modern conditions of warfare. It should be stated that seven among the episcopal cities, viz. Cologne, Mainz, Worms, Spire, Strassburg, Basel and Regensburg, claimed a privileged position as "Free Cities," but neither is the ground for this claim clearly established, nor its nature well defined. The general obligations of the imperial cities towards the Empire were the payment of an annual fixed tax and the furnishing of a number of armed men for imperial wars, and from these the above-named towns claimed some measure of exemption. Some of the imperial cities lost their independence at an early date, as unredeemed pledges to some prince who had advanced money to the emperor. Others seceded as members of the Swiss Confederation. But a considerable number survived until the reorganization of the Empire in 1803. At the peace in 1815, however, only four were spared, namely, Frankfort, Bremen, Hamburg and Lübeck, these being practically the only ones still in a sufficiently flourishing and economically independent position to warrant such preferential treatment. But finally Frankfort, having chosen the wrong side in the war of 1866, was annexed by Prussia, and only the three seaboard towns remain as full members of the new confederate Empire under the style of Freie und Hansestädte. But until modern times most of the larger Landstädte or mesne-towns for all intents and purposes were as independent under their lords as the imperial cities were under the emperor. They even followed a foreign policy of their own, concluded treaties with foreign powers or made war upon them. Nearly all the Hanseatic towns belonged to this category. With others like Bremen, Hamburg and Magdeburg, it was long in the balance which class they belonged to. All towns of any importance, however, were for a considerable time far ahead of the principalities in administration.

² From Keutgen, Ämter und Zünfte (Jena, 1903).
COMMUNE, MEDIEVAL

It was largely this fact that gave them power. When, therefore, from about the 15th century the princely territories came to be better organized, much of the raison d'être for the exceptional position held by the towns disappeared. The towns from an early date made it their policy to suppress the exercise of all handicrafts in the open country. On the other hand, they sought an increase of power by extending rights of citizenship to numerous individual inhabitants of the neighbouring villages (Pfalburger, a term not satisfactorily explained). By this and other means, e.g. the purchase of estates by citizens, many towns gradually acquired a considerable territory. These tendencies both princes and lesser nobles naturally tried to thwart, and the mediate towns or Landstädte were finally brought to stricter subjection, at least in the greater principalities such as Austria and Brandenburg. Besides, the less favourably situated towns suffered through the concentration of trade in the hands of their more fortunate sisters. But the economic decay and consequent loss of political influence among both imperial and territorial towns must be chiefly ascribed to internal causes. Certain leading political economists, notably K. Bücher (Die Bevölkerung von Frankfurt a. M. im 14ten und 15ten Jahrhunderte, i., Tübingen, 1886; Die Entstehung der Volkswirtschaft, 5th ed., Tübingen, 1906), and, in a modified form, W. Sombart (Der moderne Kapitalismus, 2 vols., Leipzig, 1902), have propounded the doctrine of one gradual progression from an agricultural state to modern capitalist conditions. This theory, however, is nothing less than an outrage on history. As a matter of fact, as far as modern Europe is concerned, there has twice been a progression, separated by a period of retrogression, and it is to the latter that Bücher's picture of the agricultural and strictly protectionist town (the geschlossene Stadtwirtschaft) of the 14th and 15th centuries belongs, while Sombart's notion of an entire absence of a spirit of capitalist enterprise before the middle of the 15th century in Europe north of the Alps, or the 14th century in Italy, is absolutely fantastic. 1 The period of the rise of cities till well on in the 15th century was naturally a period of expansion and of a considerable amount of freedom of trade. It was only afterwards that a protectionist spirit gained the upper hand, and each town made it its policy to restrict as far as possible the trade of strangers. In this revolution the rise of the lower strata of the population to power played an important part.

The craft-gilds had remained subordinate to the Rat, but by-and-by they claimed a share in the government of the towns. Originally any inhabitant holding a certain measure of land, freehold or subject to the mere nominal ground-rent above-mentioned, was a full citizen independently of his calling, the clergy and the lord's retainers and servants of whatever rank, who claimed exemption from scot and lot, to use the English formula, alone excepted. The majority of the artisans, however, were not in this happy position. Moreover, the town council, instead of being freely elected, filled up vacancies in its ranks by co-optation, with the result that all power became vested in a limited number of families. Against this state of things the craft-gilds rebelled, alleging mismanagement, malversation and the withholding of justice. During the 14th and 15th centuries revolutions and counter-revolutions, sometimes accompanied by considerable slaughter, were frequent, and a great variety of more democratic constitutions were tried. Zürich, however, is the only German place where a kind of tyrannis, so frequent in Italy, came to be for a while established. On the whole it must be said that in those towns where the democratic party gained the upper hand an unruly policy abroad and a narrowed-minded protection at home resulted. An inclination to hasty measures of war and an unwillingness to observe treaties among the democratic towns of Swabia were largely responsible for the disasters of the war of the Swabian League in the 14th century. At home, whereas at first markets had been free and open to any comer, a more and more protective policy set in, traders from other towns being subjected more and more to vexatious restrictions. It was also made increasingly difficult to obtain membership in the craft-gilds, high admission fees and so-called masterpieces being made a condition. Finally, the number of members became fixed, and none but members' sons and sons-in-law, or members' widows' husbands were received. The first result was the formation of a numerous proletariat of life-long assistants and of men and women forcibly excluded from following any honest trade; and the second consequence, the economic ruin of the town to the exclusive advantage of a limited number. From the end of the 15th century population in many towns decreased, and not only most of the smaller ones, but even some once important centres of trade, sank to the level almost of villages. Those cities, on the other hand, where the mercantile community remained in power, like Nuremberg and the seabornd towns, on the whole followed a more enlightened policy, although even they could not quite keep clear of the ever-growing protective tendencies of the time. Many even of the richer towns, notably Nuremberg, ran into debt irretrievably, owing partly to an exorbitant expenditure on magnificent public buildings and extensive fortifications, calculated to resist modern instruments of destruction, partly to a faulty administration of the public debt. From the 13th century the towns had issued ("sold," as it was called) annuities, either for life or for perpetuity in ever-increasing number, until it was at last found impossible to raise the funds necessary to pay them.

One of the principal achievements of the towns lay in the field of legislation. Their law was founded originally on the general national (or provincial) law, on custom, and on special privilege. New foundations were regularly provided by their lord with a charter embodying the most important points of the special law of the town in question. This miniature code would thenceforth be developed by means of statutes passed by the town council. The codification of the law of Augsburg in 1276 already fills a moderate volume in print (ed. by Christian Meyer, Augsburg, 1872). Later foundations were frequently referred by their founders to the nearest existing town of importance, though that might belong to a different lord. Afterwards, if a question in law arose which the court of a younger town found itself unable to answer, the court next senior in affiliation was referred to, which in turn would apply to the court above, until at last that of the original mother town was reached, whose decision was final. This system was chiefly developed in the colonial east, where most towns were affiliated directly or indirectly either to Lübeck or to Magdeburg; but it was by no means unknown in the home country. A number of collections of such judgments (Schöffenursprüche) have been published. It is also worth mentioning that it was usual to read the police by-laws of a town at regular intervals to the assembled citizens in a morning-speech (Morgensprach). 2

nobles and knights were carefully shut out as long as the town's independence was at stake, the members of a princely garrison being required to take up their abode in the citadel, separated from the town proper by a wall. Only in the comparatively few cathedral cities this rule does not obtain. It will be seen that, in consequence of this, municipal life in Italy was from the first more complex, the main constituent parts of the population being the capitani, or greater nobles, the valvassori, or lesser nobles (knights) and the people (popolo). Furthermore, the bishops being in most cases the exponents of the imperial power, the struggle for freedom from the latter ended in a radical riddance from all temporal episcopal government as well. Foremost in this struggle stood the cities of Lombardy, most of which all through the barbarian invasions had kept their walls in repair and maintained some importance as economic centres, and whose popolo largely consisted of merchants of some standing. As early as the 9th century the laws of the Langobard King Astulf distinguished three classes of merchants (negoliati), among whom the mieuxes et potenter were required to keep themselves provided with horse, lance, shield and a curass. The valley of the I. formed the main artery of trade between western Europe and the East, Milan being besides the point of convergence for all Alpine passes west of the Brenner (the St Gotthard, however, was not made accessible until early in the 13th century). Lombard merchants soon spread all over western Europe, a chief source of their ever-increasing wealth being their employment as bankers of the papal see.

The struggle against the bishops, in which a clamour for a reform of clerical life and a striving for local self-government were strangely interwoven, had raged for a couple of generations when King Henry V., great patron of municipal freedom as he was, legalized by a series of charters the status quo (Cremona, 1114, Mantua, 1116). But under his weak successors the independence of the cities reached such a pitch as to be manifestly intolerable to an energetic monarch like Frederick I. Besides, the more powerful among them would subdue or destroy their weaker neighbours, and two parties were formed, one headed by Milan, the other by Cremona. Como and Lodi complained of the violence used to them by the former city. Therefore in 1158 a commission was appointed embracing four Roman legists as representatives of the emperor, as well as those of fourteen towns, to examine into the imperial and municipal rights. The claims of the imperial government, jurisdictional and other, were acknowledged, only such rights of self-government being admitted as could be shown to be grounded on imperial charters. But when it came to carrying into effect these Roncaglione decrees, a general rising resulted. Milan was besieged by the emperor and destroyed in 1162 in accordance with the verdict of her rivals. Nevertheless, after a defeat at Legnano in 1176, Frederick was forced to renounce all pretensions to interference with the government of the cities, merely retaining an overlordship that was not much more than formal (peace of Constance in 1183). All through this war the towns had been supported by Pope Alexander III. Similarly under Frederick II. the renewal of the struggle for independence led to the richly armed and ever-increasing body of the cities, which feared lest an imperial triumph over the church would likewise threaten their independence.

The emperor's death finally decided the issue in their favour. Constitutionally, municipal freedom was based on the formation of a commune headed by elected consuls, usually to the number of twelve, representing the three orders of capitani, valvassori and popolo. Frequently, however, the number actually wielding power was much more restricted, and their position altogether may rather be likened to that of their Roman predecessors than to that of their German contemporaries. In all important matters they asked the advice and support of 'wise men,' sapientes, discretiores, prudentes, as a body called the credenza, while the popular assembly (parlamentum, concio, consilium generale) was the true sovereign. The consuls with the assistance of iudices also presided in the law-courts; but besides the consuls of the commune there were consules de placitis specially appointed for jurisdictional purposes.

In spite of these multifarious safeguards, however, family factions early destroyed the fabric of liberty, especially as, just then there was an imperial, or Ghibelline, and a papal, or Guelf party among the cities as a whole, thus also within each town each faction would allege adherence to and claim support by one or other of the great world-powers. To get out of the dilemma of party-government, resort was thereupon had to the appointment as chief magistrate of a podestà from among the nobles or knights of a different part of the country not mixed up with the local feuds. But the end was in most cases the establishment of the despoticism of some leading family, such as the Visconti at Milan, the Gonzaga at Mantua, the della Scala in Verona and the Carrara in Padua.

In Tuscany, the historic rôle of the cities, with the exception of Pisa, begins at a later date, largely owing to the overlordship of the powerful margraves of the house of Canossa and their successors, who here represented the emperor. Pisa, however, together with Genoa, all through the 13th century distinguished itself by war waged in the western Mediterranean and its isles against the Saracens. Both cities, along with Venice, but especially the Genoese, also did excellent service in reducing the Syrian coast towns still in the hands of the Turks and the emirs of Kings Baldwin I. and Baldwin II. of Jerusalem, while more particularly Pisa with great constancy placed her fleet at the disposal of the Hohenstaufen emperors for warfare with Sicily.

Meanwhile communes with consuls at their head were formed in Tuscany much as elsewhere. On the other hand the Tuscan cities managed to prolong the reign of liberty to a much later epoch, no podestà ever quite succeeding here in his attempts to establish the rule of his dynasty. Even when in the second half of the 13th century the Medici in Florence attained to power, the form at least of a republic was still maintained, and not till 1331 did one of them, supported by Charles V., assume the ducal title.

Long before the last stage, the rule of signori, was reached, however, the commune as originally constituted had everywhere undergone radical changes. As early as the 13th century the lower orders among the inhabitants formed an organization under officers of their own, side by side with that of the commune, which was controlled by the great and the rich; e.g., at Florence the people in 1250 rose against the turbulent nobles and chose a capitano del popolo with twelve ansiani, two from each of the six city-wards (settieri), as his council. The popolo itself was divided into twenty armed companies, each under a gonfaloniere. But later the arti (craft-gilds), some of whom, however, can be shown to have existed under consuls of their own as early as 1293, attained supreme importance, and in 1282 the government was placed in the hands of their priori, under the name of the signoria. The Guelf nobles were at first admitted to a share in the government, on condition of their entering a guild, but in 1293 even this privilege was withdrawn. The ordinamenti della giustizia of that year robbed the nobility of all political power. The lesser or lower arti, on the other hand, were conceded a full share in it, and a gonfaloniere della giustizia was placed at the head of the militia. In the 14th century twelve buoni uomini representing the main guilds of the city were foundered, and in the year 1300 the consul of each of these dignitaries holding office for two months only. And besides all these, there existed three competing chief justices and commandants of the forces called in from abroad and holding office for six months, viz., the podestà, the capitano del popolo, and the esecutore della giustizia. In spite of all this complicated machinery of checks and balances, revolution followed upon revolution, nor could an occasional reign of terror be prevented like that of the Signore Gauthier de Brienne, duke of Athens (1342-1343). It was not till after a rising of the lowest order of all, the industrial labourers, had been suppressed in 1378 (tumulo dei Ciompi, the wool-combers), that quieter times ensued under the wise leadership, first of the Albizzi and finally of the Medici.

The history of the other Tuscan towns was equally tumultuous, all of them save Lucca, after many fitful changes finally passing under the sway of Florence, or the grand-duchy of Tuscany, as the state was now called. Pisa, one time the mightiest, had been
crushed between its inland neighbour and its maritime rival Genoa (battle of Meloria, 1382).

Apart in its constitutional development from all other towns in Italy, and it might be added, in Europe, stands Venice. Almost alone among Italian cities its origin does not go back to Roman times. It was not till the invasions of Hun and Langobard that fugitives from the Venetian mainland took refuge among the poor fishermen on the small islands in the lagoons and on the lido—the narrow stretch of coast-line which separates the lagoons from the Adriatic—some at Grado, some at Malmocco, others on Rialto. A number of small communities was formed under elected tribunes, acknowledging as their sovereign the emperor at Constantinople. Treaties of commerce were concluded with the Langobard kings, thus assuring a market for the sale of imports from the East and for the purchase of agricultural produce. Just before or after a.d. 700 the young republic seems to have thrown off the rule of the Byzantine dux Histriae et Venetiae and elected a duke (doge) of its own, in whom was vested the executive power, the right to convolve the popular assembly (concio) and appoint tribunes and justices. Political unity was thus established, but it was not till after another century of civil war that Rialto was definitely chosen the seat of government and thus the foundation of the present city laid.

After a number of attempts to establish a hereditary dukedom, Duke Domenico Flabianico in 1032 passed a law providing that no duke was to appoint his successor or procure him to be elected during his own lifetime. Besides this two councils were appointed without whose consent nothing of importance was to be done. After the murder by the people of Duke Vitale Michiel in 1172, who had suffered naval defeat, it was deemed necessary to introduce a stricter constitutional order. According to the orthodox account, some details of which have, however, recently been impugned, the irregular popular meeting was replaced by a great council of from 430 to 480 members elected annually by special appointed electors in equal proportion from each of the six wards. One of the functions of this body was to appoint most of the state officials or their electors. There was also an executive council of six, one from each ward. Besides these the duke, who was henceforward elected by a body of eleven electors from among the aristocracy, would invite persons of prominence (the presiadi) in order to secure their assent and cooperation, whenever a measure of importance was to be placed before the great council. Only under extraordinary circumstances the concio was still to be called. The tenure of the duke's office was for life. The general tendency of constitutional development in Venice henceforward ran in an exactly opposite direction to that of all other Italian cities towards a growing restriction of popular rights, until in 1296 the great council was for all future time closed to all but the descendants of a limited number of noble families, whose names were in that year entered in the Golden Book. It still remained to appoint a board to superintend the executive power. These were the avogadori di commune, and, since Tiepolo's conspiracy in 1310, the Consiglio dei Dieci, the Council of Ten, which controlled the whole business of the state, of which there developed in the 16th century the state inquisition.

While in all prominent Italian cities the leading classes of the community were largely made up of merchants, in Venice the nobility was entirely commercial. The marked steadiness in the evolution of the Venetian constitution is no doubt largely due to this fact. Elsewhere the presence of large numbers of turbulent country nobles furnished the first germ for the ensuing dissensions which ruined such promising beginnings. In Venice, on the contrary, its businesslike habits of mind led the ruling class to make what concessions might seem needful, while both the masses and the head of the state were kept in due subjection to the laws. Too much stability, however, finally changed into stagnation, and decay followed. The foreign policy of Venice was likewise mainly dictated by commercial motives, the chief objectives being commercial privilege in the Byzantine empire and in the Frankish states in the East, domination of the Adriatic,

1 H. Kretschmar, Geschichte von Venedig, vol. i. (Gotha, 1905).

The constitutional history of the communes in northern France in a number of points widely differed from that of these villes consulaires. First of all the movement for their establishment in most cases was to a far greater degree of a revolutionary character. These revolutions were in the first place directed against the bishops; but the position both of the higher clergy and of the nobility was here of a nature distinctly more hostile to the aspirations of the citizens than it was in the south. As a result the clergy and the nobles were excluded from all membership of
COMMUNE, MEDIEVAL

the commune, except inasmuch as that those residing in the town might be required to swear not to conspire against it. The commune (communitas, communia, comunidad, comunidad, com- jurati, comuniatis) was formed by an oath of mutual help (sacramentum, juramentum communis). The members were described as jurati (also burgenses, vicini, amici), although in some communes that term was reserved for the members of the governing body. None but men of free and legitimate birth, and free from debt and contagious or incurable disease were received.

The members of the governing body were styled jurés (jurati), pairs (pares) or échevins (scabini). The last was, however, as in Germany, more properly the title of the jurors in the court of justice, which in many cases remained in the hands of the lord. In some cases the town council developed out of this body; but in the larger cities, like Rouen, several councils worked and all these names were employed side by side. The number of the members of the governing body proper varies from twelve to a hundred, and its functions were both judicial and administrative. There was also known an arrangement corresponding to the German alle und sitzende Rat, viz. of retired members who could be called in to lend assistance on important occasions. The most striking distinction, however, as against the villes consulaires was the elevation of the president of the body into president of the town, or maire (viz. also called prédôt, praecipitus). As elsewhere, at first none but the civic aristocracy were admitted to take part in the management of the town’s affairs; but from the end of the 13th century a share had to be conceded to representatives of the crafts. Dissatisfaction, however, was not easily allayed; the lower orders applied for the intervention of the king; and that effectively put an end to political freedom. This tendency of calling in state help marks a most striking difference as against the policy followed by the German towns, where all classes appear to have been always far too jealous of local independence. The result for the nation was in the one case despotism, equality and order, in the other individual liberty and an inability to move as a whole. At an earlier stage the king had frequently come to the assistance of the communes in their struggle with their lords. By-and-by the king’s confirmation came to be considered necessary for their lawful existence. This proved a powerful lever for the extension of the king’s authority. It may seem strange that in France the towns never had recourse to those interurban leagues which played so important a part in Italian and in German history. Thus the commune and the villes consulaires together form the group of villes libres. As opposed to these stand the villes franches, also called villes prévotales after the chief officer, villes de bourgeoisie or villes soumises. They make up by far the majority of French towns, comprising all those situated in the centre of the kingdom, and also a large number in the north and the south. They are called villes franches on account of their possessing a franchise, a charter limiting the services due by the citizens to their lord, but political status they had little or none. According to the varying extent of the liberties conceded them, there may be distinguished towns governed by an elective body and more or less fully authorized to exercise jurisdiction; towns possessing some sort of municipal organization, but no rights of jurisdiction, except that of simple police; and, thirdly, those governed entirely by seignorial officers. To this last class belong some of the most important cities in France, wherever the king had power enough to withhold liberties deemed dangerous and unnecessary. On the other hand, towns of the first category often come close to the villes libres. A stricter line of demarcation, however, remains in the mutual path which forms the basis of the commune and both varieties of the latter, and in the fact that the ville libre stands to its lord in the relation of vassal and not in that of an immediate possession. But however completement assujetie Paris might be, its organization, naturally, was immensely more complex than that of hundreds of smaller places which, formally, might stand in an identical relationship to their lords. Like other villes franches under the king, Paris was governed by a prédôt (provost), but certain functions of self-government for the city were delegated to the company of the marchands de l’eau, mercatores aquae, also called mercatores assailli, that is, the guild of merchants whose business lay down the river Seine, in other words, a body naturally exclusive, not, however, to the citizens as such. At their head stood a prédôt des marchands and four eschevins de la marchandise. Other prédôts were occasionally called in, and from 1296 prédôts and échevins appointed twenty-four councillors to form with themselves a paroix aux bourgeois. The crafts of Paris were organized in métiers, whose masters were appointed, some by the prédôt de Paris, and some by certain great officers of the court. In the tax rolls of a.d. 1292 to 1300 no fewer than 448 names of crafts occur, while the Livre des métiers written in 1268 by Étienne de Boileau, then prédôt de Paris, enumerates 101 organized bodies of tradesmen or women and artisans. Among the duties of these bodies, as elsewhere, was the guet or night-watch, which necessitated a military organization under quartrins, cinquantains and dixains. This gave them a certain power. But both their revolutions, under the prédôt des marchands, Étienne Marcel, after the battle of Maupertuis, and again in 1382, were extremely short-lived, and the only tangible result was a stricter subjection to the king and his officers.

At the exception of Paris, the cities, as among the cities of France is taken under the name of Flanders, more particularly the three “Great Towns,” Bruges, Ghent and Ypres, whose population was Flemish, i.e. German. They sprang up at the foot of the count’s castles and rose in close conjunction with his power. On the accession of a new house they made their power felt as early as 1128. Afterwards the counts of the house of Dampierre fell into financial dependence on the burghers, and therefore allied themselves with the rising artisans, led by the weavers. These, however, proved far more unruly, bloody conflicts ensued, and for a considerable period the three great cities ruled the whole of Flanders with a high hand. Their influence in the foreign relations of the country was likewise great, it being in their interest to keep up friendly relations with England, on whose wool the flourishing state of the staple industry of Flanders depended. It is a remarkable fact that the historical position taken up by these cities, which politically belonged to France, is much more akin to the part played by the German towns, whereas Cambrai, whose population was French, is the only city politically situated in Germany, where a commune came to be established.

In the Spanish peninsula, the chief importance of the numerous small towns lay in the part they played as fortresses during the unceasing wars with the Moors. The kings therefore extended special privileges (fueros) to the inhabitants, and they were even at an early date admitted to representation in the Cortes (parliament). Of greater individual importance than all the rest was Barcelona. Already in 1068 Count Berengarius gave the city a special law (usatis) based on its ancient usages, and from the 14th century its commercial code (libro del consolati del mar) became influential all over southern Europe.

The constitutions of the Scandinavian towns were largely modelled on those of Germany, but the towns never attained anything like the same independence. Their dependence on the royal government most strongly comes out in the fact of their being uniformly regulated by royal law in each of the three kingdoms. In Sweden particularly, German merchants by law took an equal share in the government of the towns. In Denmark their influence was also great, and only in Norway did they remain in the position of foreigners in spite of their famous settlement at Bergen. The details, as well as those of the Hanseatic League, were primarily in the Baltic and on the east coast of the Baltic, belong rather to the history of the Hanseatic League (q.v.), Denmark appears to be the only one of the three kingdoms where gladi at an early date played a part of importance.

BIBLIOGRAPHY.—The only book dealing with the subject in general, viz. K. D. Höflmann, Städteleven des Mittelalters (4 vols., Bonn, 1826-1828), is quite antiquated. For Germany it is best to consult Richard Schröder, Lehrbuch der deutschen Reichsgeschichte (4th ed., Leipzig, 1907), §§ 51 and 56, where a bibliography as complete as need be is given, both of monographs dealing with various
COMMUNISM

aspects of the question, and of works on the history of individual towns. The latter alone covers two large octavo pages of small print. As a sort of complement to Schröder's chapters may be considered, F. Keutgen, Urkunden zur ärztlichen Verfassungsgeschichte (Berlin, 1867), and C. Scheppig, Geschichtlichkeit der Eisenbahn (Gotha, 1890).

The great work of G. von Maurer, Geschichte der Staatsoberverfassung von Deutschland (4 thick vols., Erlangen, 1869-1871), contains an enormous amount of information and is arranged in such a manner as the present age requires. There is an excellent succinct account for general readers by Georg von Below, "Das ältre deutsche Stadtwesen und Bürgertum," Monographien zur Volkskunde, vi. (Breslau, 1898, Breslau, 1900). One of the most important recent monographs has been mentioned above. As for Italy, the most valuable general work for the early times is still Carl Hegel, Geschichte der Staatsoberverfassung in Italien seit der Zeit der Kommune (Berlin, 1883), but this work is written in a small vols., Leipzig, 1887, price second-hand, M. 40, in which it was for the first time fully proved that there is no connexion between Roman and modern municipal constitutions. For the period from the 13th century it will perhaps be best to turn to Luchaire's "De l'état civil," tome iii. (Paris, 1890). As to the communes of the 14th and 15th centuries, it is necessary to refer to the works of Robert Luchaire, Geschichte der deutschen Städte, vol. ii. (Berlin, 1890); Hubert Scheppig and W. Flach, Die deutschen Städteverfassungen (3rd ed., Berlin, 1894). Another important work is the "Historische Forschungen zur Geschichte von Florenz" (vols. i.-iv., Berlin, 1866-1898); Heinrich Kretschmayer, Geschichte von Venedig (vol. i., Gotha, 1905, to 1908). For France, there are the works by Achille Luchaire, Les Institutions de l'empire, des rois de France, et de la France par la monarchie absolue (3 vols., Paris, 1892), and Paul Viollet, "Les Communes françaises au moyen âge," Mémoires de l'Academie des Inscriptions et Belles-lettres, tome xxxvi. (Paris, 1893). There is, of course, also accounts in the great works on French and Italian history, F. Flury, Geschichte der politischen Stände in Deutschland, vol. i., 14th century (Gotha, 1894); J. L. Luchaire, "La commune juridique romane," in the dritte Abteilung, "De l'état civil," tome iii. (Paris, 1890); and perhaps the one in Luchaire's Manuel des institutions françaises, période du Capétiens directs (Paris, 1892) deserves special recommendation.

Another valuable account for France north of the Loire is that of a recent work by Hubert Scheppig, Geschichte der germanschen Volker im Mittelealter (2 vols., Leipzig, 1891; see English Historical Review, vol. xii. 120-127). Of course, there are also numerous monographs, among which the following may be mentioned: Edouard Bonvalot, Le tiers état d'après la charte de Paris (1263, cahiers du Glasson); and, L. K. G. Etablissements de Rouen (2 vols., Paris, 1883-1885); also a collection of documents by Gustave Pagniez, Documents relatifs à l'histoire de l'industrie et du commerce en France (2 vols., Paris, 1892, 1900).

Some other works on the history of the communal period should still be mentioned, such as W. Heyd, Geschichte des Leinwandhandels im Mittelelter (2 vols., Stuttgart, 1879); French edition by Furcy Raynaud, 2 vols., Paris, 1885 seq., improved by the author, received by the National Library. There is also a work on the romanischen Völker des Mittelmeergebietes bis zum Ende der Kriegszeit (Munich and Berlin, 1906); Aloys Schulte, Geschichte des mittelalterlichen Handels und Verkehrs zwischen Westdeutschland und Spanien (2 vols., Leipzig 1867); and, F. L. Goldschmidt, Universalgeschichte des Handelsrechts (1 vol., Stuttgart, 1891). As for the Scandinavian towns, the best guide is perhaps the book by K. Hegel, Städte und Gilden der germanischen Völker, already mentioned; but see also Dietrich Schäfer, "Der Stand der Geschichtswissenschaft im skandinavischen Norden," Internationale Wochenschrift, November 16, 1907.

COMMUNISM, the name loosely given to schemes of social organizations depending on the abolition of private property and its absorption into the property of a community as such. It is a form of what is now generally called socialism (q.v.), the terminology of which has varied a good deal according to time and place; but the expression "communism" may be conveniently used, as opposed to "socialism" in its wider political sense, or to the political and municipal varieties known as "collectivism," "state socialism," &c., in order to indicate more particularly the historical schemes propounded or put into practice for establishing certain ideally arranged communities composed of individuals living and working on the basis of holding their property in common. It has nothing, of course, to do with the Paris Commune, overthrown in May 1871, which was a political and not an economic movement. Communist schemes have been advocated in almost every age and country, and have to be distinguished from mere Wachsmuth and from the selfish desire to transfer other people's property into one's own pockets. The opinion that a communist is merely a man who has no property to lose, and therefore advocates a redistribution of the wealth, is contrary to the established facts as to those who have historically supported the theory of communism. The Corn-laws, Rhymer's views on this subject are amusing, but only apply to the latter sort:-

"What is a Communist! One that hath yearnings For equal division of unequal earnings. Idler or binder, or both, he is willing To fork out his penny and pocket your shilling."

This is the communist of hostile criticism—a criticism, no doubt, ultimately based on certain fundamental facts in human nature, which have usually wrecked communist schemes of a purely altruistic type in conception. But the great communists, like Plato, More, Saint-Simon, Robert Owen, were the very reverse of selfish or idle in their aims; and communism as a force in the historical evolution of economic and social opinion must be regarded on its ideal side, and not merely in its lapses, however natural the latter may be in operation, owing to the defects of human character. As a theory it has inspired not only some of the finest characters in history, but also much of the gradual evolution of economic organization—especially in the case of co-operation (q.v.); and its opportunities have naturally varied according to the state of social organization in particular countries. The communism of the early Christians, for instance, was rather a voluntary sharing of private property than any abnegation of property as such. The Essenes and the Therapeutae, however, had a strange form of communism, and the former required the surrender of individual property; and in the middle ages various religious sects, followed by the monastic orders, were based on the communist principle.

Communist schemes have found advocates in almost every age and in many different countries. The one thing that is shared by all communists, whether speculative or practical, is deep dissatisfaction with the economic conditions by which they are surrounded. In Plato's Republic the dissatisfaction is not limited to merely economic conditions. In his examination of the body politic there is hardly any part which he can pronounce to be healthy. He would alter the life of the citizens of his state from the very moment of birth. Children are to be taken away from their parents and nurtured under the supervision of the state. The old nursery tales, "the blasphemous nonsense with which mothers fool the mankind out of their children," are to be suppressed. Dramatic and imitative poetry are not to be allowed. Education, marriage, the number of births, the occupations of the citizens are to be controlled by the guardians or heads of the state. The most perfect equality of conditions and careers is to be preserved; the women are to have similar training with the men, no careers and no ambition are to be forbidden to them; the inequalities and rivalries between rich and poor are to cease, because all will be provided for by the state. Other cities are divided against themselves. "Any ordinary city, however small, is in fact two cities, one the city of the poor, the other of the rich, at war with one another" (Republic, bk. iv. p. 249, Jowett's translation). But this ideal state is to be a perfect unit; although the citizens are divided into classes according to their capacity and ability, there is none of the exclusiveness of birth, and no inequality is to break the accord which binds all the citizens, both male and female, together into one harmonious whole. The marvellous comprehensiveness of the scheme for the government of this ideal state makes it belong as much to the modern as to the ancient world. Many of the social problems to which Plato draws attention are yet unsolved, and some are in process of solution in the direction indicated by him. He is not appalled by the immensity of the task which he has sketched out for himself and his followers. He admits that there are difficulties to be overcome, but he says in a sort of parenthesis, "Nothing great is easy." He refuses to be satisfied with half measures and patch-work reforms. "Enough, my friend! but what is enough while anything remains wanting?" These sentences indicate the spirit in which philosophical as distinguished from practical communists from the time of Plato till to-day have undertaken to reconstruct human society.
Sir Thomas More's *Utopia* has very many of the characteristics of *The Republic*. There is in it the same wonderful power of shaking the prejudices of the place and time in which it was written. The government of Utopia is described as founded on popular election; community of goods prevailed, the magistrates distributed the instruments of production among the inhabitants, and the wealth resulting from their industry was shared by all. The use of money and all outward ostentation of wealth were forbidden. All meals were taken in common, and they were rendered attractive by the accompaniment of sweet strains of music, while the air was filled by the scent of the most delicate perfumes. More's ideal state differs in one important respect from Plato's. There was no community of wives in Utopia. The sacredness of the family relation and fidelity to the marriage contract were recognized by More as indispensable to the well-being of modern society. Plato, notwithstanding all the extraordinary originality with which he advocated the emancipation of women, was not able to free himself from the theory and practice of regarding the wife as part and parcel of the property of her husband. The fact, therefore, that he advocated community of property led him also to advocate community of wives. He speaks of the *possession and use* of women and children, and *the necessity of the woman's duty to the community*, *and the consequent requirements of her husband's* in his ideal state. Monogamy was to him mere exclusive possession on the part of one man of a piece of property which ought to be for the benefit of the public. The circumstance that he could not think of wives otherwise than as the property of their husbands only makes it the more remarkable that he claimed for women absolute equality of training and careers. The circumstance that communists have so frequently wrecked their projects by attacking marriage and advocating promiscuous intercourse between the sexes may probably be traced to the notion which regards a wife as being a mere item among the goods and chattels of her husband. It is not difficult to find evidence of the survival of this ancient habit of mind: “I will be master of what is mine own,” says Petruchio. “She is my goods, my chattels.”

The Perfectionists of Oneida, on the other hand, held that there was “no intrinsic difference between property in persons and property in things; and that the same spirit which abolished exclusiveness in regard to money would abolish, if circumstances allowed full scope to it, exclusiveness in regard to persons.” (Weber's *Communitarian Societies of the United States*.) It is this notion of a wife as property that is responsible for the wild opinions communists have often held in favour of a community of wives and the break-up of family relations. If they could shake off this notion and take hold of the conception of marriage as a contract, there is no reason why their views on the community of property should lead them to think that this contract should not include mutual fidelity and remain in force during the life of the contracting parties. It was probably not this conception of the marriage relation so much as the influence of Christianity which led More to discountenance community of wives in Utopia. It is strange that the same influence did not make him include the absence of slavery as one of the characteristics of his ideal state. On the contrary, however, we find in Utopia the anomaly of slavery existing side by side with institutions which otherwise embody the most absolute personal, political and religious freedom. The presence of slaves in Utopia is made use of to get rid of one of the practical difficulties of communism, viz. the performance of disagreeable work. In other societies, this function is performed by the group of persons who are the most degraded, or who are forced into slavery by their own transgressions against society. In Utopia, therefore, we are expressly told that “all the uneasy and sordid services” are performed by slaves. The institution of slavery was also made supplementary to the criminal system of Utopia, as the slaves were for the most part men who had been convicted of crime; slavery for life was made a substitute for capital punishment.

In many respects, however, More's views on the labour question were vastly in advance of his own time. He repeats the indignant protest of the *Republic* that existing society is a warfare between rich and poor. "The rich," he says, "deserted by means by which they may in the first place secure to themselves what they have amassed by wrong, and then take to their own use and profit, at the lowest possible price, the work and labour of the poor. And so soon as the rich decide on adopting these devices in the name of the public, then they become law." One might imagine these words had been quoted from the programme of the International (q.v.), so completely is their tone in sympathy with the hardships of the poor in all ages. More shared to the full the keen sympathy with the hopeless misery of the poor which has been the strong motive power of nearly all speculative communism. The life of the poor as he saw it was so wretched that he said, "Even a beast's life seems enviable!" Besides community of goods and equality of conditions, More advocated other means of ameliorating the condition of the people. Although the hours of labour were limited to six a day there was no scarcity, for in Utopia every one worked; there was no idle class, no idle individual even. The importance of this from an economic point of view is insisted on by More in a passage remarkable for the importance which he attaches to the industrial production of goods for the community, and the "industry of the poor women." He says, "if you consider how great a part of all other nations is quite idle. First, women generally do little, who are the half of mankind." Translated into modern language his proposals comprise universal compulsory education, a reduction of the hours of labour to six a day, the most modern principles of sanitary reform, a complete revision of criminal legislation, and the most absolute religious toleration. The romantic form which Sir Thomas More gave to his dream of a new social order found many imitators. The *Utopia* may be regarded as the prototype of Campanella's *City of the Sun*, Harrington's *Oceana*, Bacon's *New Atlantis*, Defoe's *Essay on Projects*, Fénélon's *Voyage dans l'Ile des Plaisirs*, and other works of minor importance.

All communists have made a great point of the importance of universal education. All ideal communities have been provided by their authors with a perfect machinery for securing the education of every child. One of the first things done in every attempt to carry communist theories into practice has been to establish a good school and guarantee education to every child. The first impulse to national education in the 19th century probably came from the very marked success of Robert Owen's schools in connexion with the cotton mills at New Lanark. Compulsory education, free trade, and law reform, the various movements connected with the improvement of the condition of women, have found their earliest advocates among theoretical and practical communists. The communists denounce the evils of the present state of society; the hopeless poverty of the poor, side by side with the self-regarding luxury of the rich, seems to them to cry aloud to Heaven for the creation of a new social organization. They proclaim the necessity of sweeping away the institution of private property, and insist that this great revolution, accompanied by universal education, free trade, a perfect administration of justice, and a due limitation of the numbers of the community, would put an end to half the self-made distress of humanity.

The various communistic experiments in America are the most interesting in modern times, opportunities being naturally greater there for such deviations from the normal forms of regulations as compared with the closely organized states of Europe. For this reason, and because of their seeming to be for social settlements with peculiar views. They have been classified by Morris Hillquit (History of Socialism in the United States, 1903) as (1) sectarian, (2) Owenite, (3) Fourieristic, (4) Icarian.

1. The oldest of the sectarian group was the society of the Shakers (q.v.), whose first settlement at Watervliet was founded in 1776. The Harmony Society or Rappist Community was introduced into Pennsylvania by George Rapp (1776-1847) from Württemberg in 1804, and in 1815 they moved to a settlement (New Harmony) in Indiana, returning to Pennsylvania again in 1824, and founding the village of Economy, from which they were
also known as Economites. Emigrants from Württemberg also founded the community of Zoar in Ohio in 1817, being incorporated in 1832 as the Society of Separatists of Zoar; it was dissolved in 1898. The Amana (g.r.) community, the strongest of all American communist societies, originated in Germany in the early part of the 18th century as the "True Inspiration Society," and some 600 members removed to America in 1824-1844. The Bethel (Missouri) and Aurora (Oregon) sister communities were founded by Dr. Kil (1812-1877) in 1844 and 1850 respectively, and were dissolved in 1880 and 1881. The Oneida Community (g.r.), created by John Humphrey Noyes in 1811-1886, the author of a famous History of American Socialisms (1870), was established in 1848 as a settlement for the Society of Perfectionists. All these bodies had a religious basis, and were formed with the object of enjoying the free exercise of their beliefs, and though communist in character they had no political or strictly economic doctrine to propagate.

2. The Owenite communities rose under the influence of Robert Owen's work at New Lanark, and his propaganda in America from 1824 onwards, the principal being New Harmony (acquired from the Rappists in 1825); Yellow Springs, near Cincinnati, 1824; Nashoba, Tennessee, 1825; Haverstraw, New York, 1826; its short-lived successors, Coxackie, New York, and the Kendall Community, Canton, Ohio, 1826. All these had more or less short lives, and were founded on Owen's theories of labour and economics.

3. The Fourierist communities similarly were due to the Utopian teachings of the Frenchman Charles Fourier (g.r.), introduced into America by his disciple Albert Brisbane (1809-1850), author of The Social Destiny of Man (1840), who was efficiently helped by Horace Greeley, George Ripley and others. The North American Phalanx, in New Jersey, was started in 1833 and lasted till 1835. Brook Farm (g.r.) was started as a Fourierist Phalanx in 1844, after three years' independent career, and became the centre of Fourierist propaganda, lasting till 1847. The Western Phalanx, in Ohio, was organized in 1844, and lasted till 1850. In Pennsylvania seven communities were established between 1843 and 1845, the chief of which were the Sylvanian Association, the Peace Union Settlement, the Social Reform Unity, and the Learyville Phalanx. In New York state the chief were the Clarkson Phalanx, the Sodus Bay Phalanx, the Bloomfield Association, and the Ontario Union. In Ohio the principal were the Trumbull Phalanx, the Ohio Phalanx, the Clermont Phalanx, the Integral Phalanx, and the Columbian Phalanx; and of the remainder the Alphadelphia Phalanx, in Michigan, was the best-known. It is pointed out by Morris Hillquit that while only two Fourierist Phalanxes were established in France, over forty were started in the United States.

4. The Icarian communities were due to the communist teachings of another Frenchman, Étienne Cabet (g.r. 1788-1856), the name being derived from his social romance, Voyage en Icarie (1840), sketching the advantages of an imaginary country called Icaria, with a co-operative system, and criticizing the existing social organization. It was his idea, in fact, of a Utopia. Robert Owen advised him to establish his followers, already numerous, in Texas, and thither about 1500 went in 1848. But disappointment resulted, and their numbers dwindled to less than 500 in 1849; some 280 went to Nauvoo, Illinois; after a schism in 1856 some formed a new colony (1858) at Cheltenham, near St. Louis; others went to Iowa, others to California. The last branch was dissolved in 1895.

See also the articles Socialism; Owen; Saint-Simon; Fourier, &c.; and the bibliography to Socialism. The whole subject is admirably and exhaustively discussed by Charles H. C. Romanes in his History of American Socialisms (1870); Charles Nordhoff, the American Communist Societies of the United States (1875); and W. A. Hinde's American Communities (1878; 2nd edition, 1902), a very complete account.

COMMUTATION (from Lat. commutatio, to change), a process of exchanging one thing for another, particularly of one method of payment for another, such as payment in money for payment in kind or by service, or of payment of a lump sum for periodic payments; for various kinds of such substitution see Annuity; Copyhold and Tithes. The word is also used similarly of the substitution of a lesser sentence on a criminal for a greater.

In electrical engineering, the word is applied to the reversal of the course of an electric current, the contrivance for so doing being known as a "commutator" (see Dynamo). In America, a "commutation ticket" on a railway is one which allows a person to travel at a lower rate over a particular route for a certain time or for a certain number of times; the person holding such a ticket is known as a "commuter."

COMNENUS, the name of a Byzantine family which from 1081 to 1185 occupied the throne of Constantinople. It claimed a Roman origin, but its earliest representatives appear as landed proprietors in the district of Castamonu (mod. Kastamouni) in Phrygia. Its first member known in Byzantine history is Manuel Eroticos Comnenus, an able general who rendered great services to Basil II. (976-1025) in the East. At his death he left his two sons Isaac and John in the care of Basil, who gave them a careful education and advanced them to high official positions. The increasing unpopularity of the Macedonian dynasty culminated in a revolt of the nobles and the soldiery of Asia against its feeble representative Michael VI. Stratiosiotikos, who abdicated after a brief residence. Isaac was declared emperor, and crowned in St. Sophia on the 2nd of September 1057. For the rulers of this dynasty see Roman Empire, Later, and separate articles.

With Andronicus I. (1183-1185) the rule of the Comneni proper at Constantinople came to an end. A younger line of the original house, after the establishment of the Latins at Constantinople in 1204, secured possession of a fragment of the empire in Asia Minor, and founded the empire of Trebizond (g.r.), which lasted till 1461, when David Comnenus, the last emperor, was deposed by Mahommed II. In general terms the life of the family and its alleged survivors see article "Comnenen." By G. F. Hertzberg, in Erheb und Grufter Allgemeine Encyklopadie, and an anonymous monograph, Precis historique de la maison impériale des Comines (Amsterdam, 1784); and, for the history of the period, the works referred to under Roman Empire, Later.

COMO (anc. Colonna), a city and episcopal see of Lombardy, Italy, the capital of the province of Como, situated at the S. end of the W. branch of the Lake of Como, 30 m. by rail N. by W. of Milan. Pop. (1881) 25,540; (1901) 34,727 (town), 47,114 (commune). The city lies in a valley enclosed by mountains, the slopes of which command fine views of the lake. The old town, which preserves its rectangular plan from Roman times, is enclosed by walls, with towers constructed in the 12th century. The cathedral, built entirely of marble, occupies the site of an earlier church, and was begun in 1369, from which period the nave dates: the façade belongs to 1457-1486, while the east of the exterior was altered into the Renaissance style, and richly decorated with sculptures by Tommaso Rodari in 1487-1526. The dome is an unsuitable addition of 1737 by the Sicilian architect Filippo Juvarra (1685-1736), and its baroque decorations spoil the effect of the fine Gothic interior. It contains some good pictures and fine tapisseries. In the same line as the facade of the cathedral are the Broletto (in black and white marble), dating from 1215, the seat of the original rulers of the commune, and the massive clock-tower. The Romanesque church of S. Ambodio outside the town was founded in 1013 and consecrated in 1095; it has two fine campanli, placed at the ends of the aisles close to the apse. It occupies the site of the 5th-century church of S. Peter and Paul. Near it is the Romanesque church of S. Carpoforo. Above it is the ruined castle of Baradello. The churches of S. Giacomo (1095-1117) and S. Fedele (12th century), both in the town, are also Romanesque, and the apses have external galleries. The Palazzo Giovo contains the Museo Civico. Como is a considerable tourist resort, and the steamboat traffic on the lake is largely for travellers. A climate station is established on the hill of Brunate (2350 ft.) above the town to the E., reached by a funicular railway. The Milanese possess many villas here. Como is an industrial town, having large silk factories and other industries (see Lombardy). It is connected with Milan by two lines of railway, one via Monza (the main line,
COMO, LAKE OF—COMORO ISLANDS

which goes on to Chiasso—Swiss frontier—and the St Gotthard), the other via Sarono and also with Lecco and Variese.

Of the Roman Comum little remains above ground; a portion of its S.E. wall was discovered and may be seen in the garden of the Liceo Volta, 88 ft. within the later walls: later fortifications (but previous to 1127), largely constructed with Roman inscribed sepulchral urns and other fragments, had been superimposed on it. Thermae have also been discovered (see V. Barelli in Notizie degli scavi, 1886, 333; 1891, 333; 1894, 285). The inscriptions, on the other hand, are numerous, and give an idea of its importance. The statements as to the tribe which originally possessed it are various. It belonged to Gallia Cisalpina, and first came into contact with Rome in 196 B.C., when M. Claudius Marcellus conquered the Insubres and the Comenses. In 89 B.C., having suffered damage from the Raetians, it was restored by Cn. Pompeius Strabo, and given Latin rights with the rest of Gallia Transpadana. Shortly after this 300 colonists seem to have been sent there; 5000 were certainly sent by Caesar in 59 B.C., and the place received the name Novum Comum. It appears in the imperial period as a municipium, and is generally spoken of as Comunum simply. The place was prosperous; it had an important market, and was the capital of a group of lakes which are now, dotted with villas. It was also important as the starting-point for the journey across the lake on the line between the Splugen and Septimius passes (see CHAUVENNA). It was the birthplace of both the elder and the younger Pliny, the latter of whom founded baths and a library here and gave money for the support of orphan children. There was a praetextus classis Comensis under the late empire, and it was regarded as a strong fortress. See Ch. Hulsen in Pauly-Wissowa, Realencyclopaedie, Suppl. Heft i. (Stuttgart, 1903), 326.

Como suffered considerably from the early barbarian invasions, many of the inhabitants taking refuge on the Isola Comacina off Sala, but recovered in Lombard times. It was from that period that the magistri Comacini formed a privileged corporation of architects and sculptors, who were employed in other parts of Italy also, until, at the end of the 11th century, individuals began to come more to the front (G. T. Rivoira, Origini dell'architettura Lombarda, Rome, 1901, i. 127 f.). Como then became subject to the archbishops of Milan, and gained its freedom towards the end of the 12th century. At the beginning of the 12th century war broke out between Como and Milan, and after a ten years' war Como was taken and its fortifications dismantled in 1127. In 1154, however, it took advantage of the arrival of Barbarossa, and remained faithful to him throughout the whole war of the Lombard League. After frequent struggles with Milan, it fell under the power of the Visconti in 1335. In 1355, like the rest of Lombardy, it fell under Spanish dominion, and in 1714 under Austrian. Thenceforth it shared the fortunes of Milan, becoming in the Napoleonic period the chief town of the department of the Lario. Its silk industry and its position at the entrance to the Alpine passes gave it some importance even then. It bore a considerable part in the national risings of 1848-1859 against Austrian rule. (T. A.)

COMO, LAKE OF (the Lacus Laris of the Romans, and so sometimes called Lario to the present day, though in the 4th century it is already termed Lacus Comoecinus), one of the most celebrated lakes in Lombardy, northern Italy. It lies due east of Milan and is formed by two larger branches through which the Valtelline to the north end of the lake (here falls in the Maira or Mera, coming from the Val Bregaglia) and flows out of it at its south-eastern extremity, on the way to join the Po. Its area is 555 sq. m., it is about 45 m. from end to end (about 306 m. from the north end of Bellagio), it is from 1 to 2 m. in breadth, its surface is 653 ft. above the sea, and its greatest depth is 1365 ft. A railway line now runs along its eastern shore from Colico to Lecco (244 m.), while on its western shore Menaggio is reached by a steam tramway from Porlezza on the Lake of Lugano (8 m.). Colico, at the northern extremity, is by rail 17 m. from Chiavenna and 42 m. from Tirano, while at its southern end Como (on the St Gotthard line) is 32 m. from Milan, and Lecco about the same distance. The lake fills a remarkable depression which has been cut through the limestone ranges that enclose it, and once doubtless extended as far as Chiavenna, the Lake of Mezzola being a surviving witness of its ancient bed. Towards the south the promontory of Bellagio divides the lake into two arms. That to the south-east ends at Lecco and is the true outlet, for the south-western arm, ending at Como, is an enclosed bay.

During the morning the Tirano wind blows from the north, while in the afternoon the Breva wind blows from the south. But, like other Alpine lakes, the Lake of Como is exposed to sudden violent storms. Its beauties have been sung by Virgil and Claudian, and the two Plinys are among the celebrities associated with the lake. The shores are bordered by splendid villas, while perhaps the most lovely spot on it is Bellagio, built in an unrivalled position. Among the other villages that line the lake, the best-known are Varenna (E.) and Menaggio (W.), nearly opposite one another, while Cadenabbia (W.) faces Bellagio.

(W. A. B. C.)

COMONFORT, IGNACIO (1812-1863), a Mexican soldier and politician, who, after occupying a variety of civil and military posts, was in December 1855 made provisional president by Alvarez, and from December 1857 was for a few weeks constitutional president. (See MEXICO.)

COMORIN, CAPE, a headland in the state of Travancore, forming the extreme southern point of the peninsula of India. It is situated in 8° 4' 20" N., 77° 35' 35" E., and is the terminus point of the western Ghats. The village of Comorin, with the temple of Kanniyambal, the "virgin goddess," on the coast at the apex of the headland, is a frequent place of pilgrimage.

COMORO ISLANDS, a group of volcanic islands belonging to France, in the Indian Ocean, at the northern entrance of the Mozambique Channel midway between Madagascar and the African continent. The following table of the area and population of the four largest islands gives one of the sets of figures offered by various authorities:

<table>
<thead>
<tr>
<th>Area sq. m.</th>
<th>Population</th>
</tr>
</thead>
<tbody>
<tr>
<td>Great Comoro</td>
<td>385</td>
</tr>
<tr>
<td>Anjouan or Johanna</td>
<td>145</td>
</tr>
<tr>
<td>Moheli</td>
<td>90</td>
</tr>
<tr>
<td>Total</td>
<td>760</td>
</tr>
</tbody>
</table>

There are besides a large number of islets of coral formation. Particulars of the four islands named follow.

1. Great Comoro, or Angazia, the largest and most westerly, has a length of about 38 m., with a width of about 12 m. Near its southern extremity it rises into a fine dome-shaped volcanic mountain, Kartola (Karthala), which is over 8000 ft. high, and is visible for more than 100 m. Up to about 6000 ft. it is clothed with dense vegetation. Eruptions are recorded for the years 1830, 1855 and 1858; and another eruption occurred in 1904. In the north the ground rises gradually to a plateau some 2000 ft. above the sea; from this plateau many regularly shaped truncated cones rise another 2000 ft. The centre of the island consists of a desert field of lava streams, about 1000 ft. high. The chief towns are Maroni (pop. about 2000), Itzanda and Mtsamuli; the first, situated at the head of a bay in 11° 40' S., being the seat of the French administrator.

2. Mayotte or Johanna, next in size, lies E. by S. of Comoro. It is some 30 m. long by 20 at its greatest breadth. The land rises in a succession of richly wooded heights till it culminates in a central peak, upwards of 5000 ft. above the sea, in 12° 14' S., 44° 27' E. The former capital, Mossamondo, on the N.W. coast, is substantially built of stone, surrounded by a wall, and commanded by a dilapidated citadel; it is the residence of the sultan and of the French administrator. There is a small but safe anchorage at Pomony, on the S. side, formerly used as a coal depot by ships of the British navy.

3. Mayotte, about 21 m. long by 6 or 7 m. broad, is surrounded by an extensive and dangerous coral reef. The principal heights on its extremely irregular surface are: Mavegani Mountain, which rises in two peaks to a maximum of 2104 ft., and Uchongi,
2100 ft. The French headquarters are on the islet of Zaudie, which lies within the reef in 12° 46' S., 45° 20' E. There are substantial government buildings and store-houses. On the mainland opposite Zaudie is Maspéré, the chief centre of trade. Mayotte was devastated in 1808 by a cyclone of great severity. 4. Moheli or Mohilla lies S. of and between Anjouan and Grand Comoro. It is 15 m. long and 7 or 8 m. at its maximum breadth. Unlike the other three it has no peaks, but rises gradually to a central ridge about 1900 ft. in height. Fomboni (pop. about 2000) in the N.W. and Numa Choa in the S.W. are the chief towns. All the islands possess a very fertile soil; there are forests of coco-nut palms, and among the products are rice, maize, sweet-potatoes, yams, coffee, cotton, vanilla and various tropical fruits, the papaw tree being abundant. The fauna is allied to that of Madagascar rather than to the mainland of Africa; it includes some land birds and a species of lemur peculiar to the islands. Large numbers of cattle and sheep, the former similar to the small species of Asia, are reared and used, as in Great Comoro, the zebra. Turtles are caught in abundance along the coasts, and form an article of export. The climate is in general warm, but not torrid nor unsuitable for Europeans. The dry season lasts from May to the end of October, the rest of the year being rainy. The natives are of mixed Malagasy, Negro and Arab blood. The majority are Mohammedans. The European inhabitants, mostly French, number about 600. There are some 200 British Indians, traders, in the islands. The external trade of the islands has developed since the annexation of Madagascar to France, and is of the value of about £100,000 a year. Sugar refineries, distilleries of rum, and sawmills are worked in Mayotte by French settlers. Cane sugar and vanilla are the chief exports. The islands are regularly visited by vessels of the Messageries Maritimes fleet, and a coaling station for the French navy has been established.

The islands were first visited by Europeans in the 16th century, they are marked on the map of Diego Ribero made in 1527. At that time, and for long afterwards, the dominant influence in, and the civilization of, the islands was Arab. According to tradition the islands were first peopled by Arab voyagers driven thither by tempests. The petty sultans who exercised authority were notorious slave traders. A Sakalava chief who had been driven from Madagascar by the Hovas took refuge in Mayotte c. 1830, and, with the aid of the sultan of Johanna, conquered the island, which for a century had been given over to civil war. French naval officers having reported on the strategic value of Mayotte, Admiral de Hell, governor of Réunion, sent an officer there in 1841, and a treaty was negotiated ceding the island to France. Possession was taken in 1843, the sultan of Johanna renouncing his claims in the same year. In 1886 the sultans of the islands were placed under French protection, France fearing that otherwise the islands would be taken by Germany. The French experienced some difficulty with the natives, but by 1892 had established their position. The islands, as regulated by the decree of the 6th of April 1908, are under the supreme authority of the governor-general of Madagascar. The local administration is in the hands of an official who himself governs Mayotte but is represented in the other islands by administrators. On the council which assists the governor are two nominated native notables. In 1910 the sultan of Great Comoro ceded his sovereign rights to France. In Anjouan the native government is continued under French supervision. The budgets of the four islands in 1904 came to some £30,000, of which Mayotte being about half the total. The chief sources of revenue are poll and house taxes, and, in Mayotte, a land tax. The Îles Glorieuses, three islets 160 m. N.E. of Mayotte, with a population of some 600 souls enclosed on the collection of guano, and the capture of turtles, were in 1892 annexed to France and placed under the control of the administrator of Mayotte.

See Notice sur Mayotte et les Comores, by Emile Vienne, one of the memoirs on the French colonies prepared for the Paris Exhibition of 1900; Le Sidaud d'Anjouan, by Jules Repiquet (Paris, 1901), a remarkable study on the geography, ethnology and history of Johanna; Les colonies françaises (Paris, 1900), vol. ii. pp. 179-197, in which the story of the archipelago is set forth by various writers; an account of the islands by A. Voeltzkow in the Zeitschrift of the Berlin Geog. Soc. (No. 9, 1906), and Carte des Îles Comores, by A. Mennier (Paris, 1904).

COMPANION—COMPANY 795

COMPANY (through the O. Fr. compagnon or compagnon, from the Late Lat. compagnia,—cum, with, and, panis, bread,—one who shares meals with another; the word has been wrongly derived from the Late Lat. compagnus, one of the same paves or companions, a fellow, a mate, "comrade," a term which has a similar origin, meaning one who shares the same camera or room). “Compagnie” is particularly used of soldiers, as in the expression “compagnie in arms,” and so is the title of the lowest rank in a military or other order of knighthood; the word is also used of a person who lives with another in a paid position for the sake of company, and is looked on rather as a friend than a servant; and of a pair or match, as of pictures and the like. Similar in ultimate origin but directly adapted from the Fr. chambre de la compagnie, and It. camera della compagnia, the storeroom for provisions on board ship, is the use of “compagnie” for the framed windows over a hatchway on the deck of a ship, and also for the hooded entrance-stairs to the captain’s cabin.

COMPANY, one of a number of words like "partnership," "union," "gild," "society," "corporation," denoting—each with its special shade of meaning—the association of individuals in pursuit of some common object. The taking of meals together was, as the word signifies (cum, with, panis, bread,) a characteristic of the early company. Gild had a similar meaning: but this characteristic, though it survives in the Livery company (see LIVERY COMPANIES), has in modern times disappeared. The word “company” is now monopolized—in British usage—by two great classes of companies—(1) the joint stock company, constituted under the Companies (Consolidation) Act 1908, which consolidated the various acts from 1862 to 1907, and (2) the “public company,” constituted under a special act to carry on some work of public utility, such as a railway, docks, gasworks or waterworks, and regulated by the Companies Clauses Acts 1844 and 1863.

1. Joint Stock Companies.

The joint stock company may be defined as an association of persons incorporated to promote by joint contributions to a common stock the carrying on of some commercial enterprise. Associations formed not for "the acquisition of gain" but to promote art, science, religion, charity or some other useful or philanthropic object, though they may be constituted under the Companies (Consolidation) Act 1908, seldom call themselves companies, but adopt some name more appropriate to express their objects, such as society, club, institute, college or chamber. The joint stock company has had a long history which can only be briefly sketched here. The name of "joint stock company" is—or was—used to distinguish such a company from the "regulated company," which did not trade on a joint stock but was in the nature of a trade gild, the members of which had a monopoly of foreign trade with particular countries or places (see Adam Smith, Wealth of Nations, bk. v. ch. i. pt. iii.).

The earliest kind of joint stock company is the chartered (see CHARTERED COMPANIES). The grant of a charter is one of the exclusive privileges of the crown, and the crown has from time to time exercised it in furtherance of trading enterprise. Examples of such grants are the Merchant Adventurers of England, chartered by Richard II. (1390); the East India Co., chartered by Queen Elizabeth (1600); the Bank of England, chartered by William and Mary (1694); the Hudson’s Bay Co.; the Royal African Co.; the notorious South Sea Co.; and in later times the New Zealand Co., the North Borneo Co., and the Royal Niger Co. Chartered companies had, however, several disadvantages. A charter was not easily obtainable. It was costly. The members could not be made personally liable for the debts of the company; and once created—though only for defined objects—such a company was invested with entire independence and could not be kept to the conditions imposed by the grant, which was against public policy. A new form of commercial association was wanted, free from these defects, and it was found in the common law.
company—the lineal ancestor of the modern trading company. The common law company was not an incorporated association; it was simply a great partnership with transferable shares. Companies of this kind multiplied rapidly towards the close of the 17th century and the beginning of the 18th century, but they were regarded with strong disfavour by the law, for reasons not very intelligible to modern notions; the chief of these reasons being that such companies purported to act as corporate bodies, raised transferable stock, used charters for purposes not warranted by the grant, and were—or were supposed to be—dangerous and mischievous, tending (in the words of the preamble of the Bubble Act) to “the common grievance, prejudice and inconvenience of His Majesty’s subjects or great numbers of them in trade, commerce or other lawful affairs.” They were too often—and this no doubt was the real ground of the prejudice against them—utilized by unprincipled persons to promote fantastic and often fraudulent schemes. Matthew Green, in his poem “The Spleen,” notes how

“Wrecks appear each day. / And safe we hear at last away.”

The result was that by the act (5 Geo. I. c. 18) commonly known as the Bubble Act (1720) such companies were declared to be common nuisances and indigible as such. But the act, though it remained on the statute book for more than one hundred years and was not formally repealed till 1825, proved quite ineffectual to check the growth of joint stock enterprise, and the legislature, finding that such companies had to be tolerated, adopted the wiser course of regulating what it could not repress. One great inconvenience of these common law trading companies arose from their being unincorporated. They were formed of large fluctuating bodies of individuals, and a person dealing with them did not know with whom he was contracting or whom he was to sue. This evil the legislature sought to rectify by empowering the crown to grant to companies by letters patent without incorporation the privilege of suing and being sued by a public officer. Ten years afterwards—in 1834—a more important line of policy was adopted, and all companies with some exceptions were enabled to obtain a certificate of incorporation without applying for a charter or special act. The act of 1832 carried this policy one step further by prohibiting all associations of more than twenty persons from carrying on business without registering under the act. These were all useful amendments, but they were amendments of form rather than substance. The real vitality of joint stock enterprise lies in the co-operative principle, and the natural growth and expansion of this fruitful principle was checked until the middle of the 19th century by the notorious risks attaching to unlimited liability. In the case of an ordinary partnership, though their liability is unlimited (or was until the Limited Partnerships Act 1907), the partners can generally tell what risks they are incurring. Not so the shareholders of a company. They delegate the management of their business to a board of directors, and they may easily find themselves committed by the fraud or folly of its members to engagements which in the days of unlimited liability meant ruin. Failures like those of Overend and Gurney, and of the Glasgow Bank, caused widespread misery and alarm. It was not until limited liability had been granted on the stock exchange that the real potency of the principle of industrial co-operation became apparent. We owe the adoption of the limited liability principle to the clear-sightedness of Lord Sherbrooke—then Mr Robert Lowe—and to the vigorous advocacy of Lord Bramwell. We owe it to Lord Bramwell also that the principle was made a feasible one. The practical difficulty was how to bring home to persons dealing with the company notice that the liability of the shareholders was limited. Lord Bramwell solved the problem by a happy suggestion—“write it on my tombstone,” he said humorously to a friend. This was that the company should add to its name the word “Limited”—paint it up on its premises, and use it on all invoices, bills, promissory notes and other documents. The proposal was adopted by the Legislature and has worked successfully. While limited companies have been multiplying at the rate of over 4000 a year, the unlimited company has become practically an extinct species. The growth of limited companies is, indeed, one of the most striking phenomena of our day. Their number may be estimated at quite 40,000. Their paid-up capital amounts to the stupendous sum of £1,800,000,000 and, what is even more significant, as the 1st Viscount Goschen remarks in his Essays and Addresses, is that “the number of shareholders has grown in a much greater ratio than the colossal growth of the aggregate capital. The profits and risks of nearly every kind of business have been spread from year to year over fresh thousands of individuals, and the middle class with moderate incomes are more and more participating in that accumulation of wealth from business of every description which formerly built up the fortunes of individual traders or of bankers or of single families.”

It is with the limited company then—the company limited by shares—as the normal type and incomparably the most important, that this article mainly deals.

*Companies Limited by Shares.*—The Companies Act 1862, was intended to constitute a comprehensive code of law applicable to joint stock trading companies for the whole of the United Kingdom. Recognizing the mischief above alluded to—of trading concerns being carried on by large and fluctuating bodies, the act begins by declaring that no company, association or partnership, consisting of more than twenty persons, or ten in the case of banking, shall be formed after the commencement of the act for the purpose of carrying on any business which has for its object the acquisition of gain by the company, association or partnership, or by the individual members thereof, unless it is registered as a company under the act, or is formed in pursuance of some other act of parliament or of letters patent, or is a company engaged in working mines within and subject to the jurisdiction of the Stannaries. Broadly speaking, the meaning of the act is that all commercial undertakings, as distinguished from literary or charitable associations, shall be registered. “Business” has a more extensive signification than “trade.” Having thus cleared the ground the act goes on to provide in what manner a company may be formed under the act. The machinery is simple, and is described as follows:

“Any seven or more persons associated for any lawful purpose may, by subscribing their names to a memorandum of association and otherwise complying with the requisitions of this act in respect of registration, form an incorporated company with or without limited liability” (§ 6). It is not necessary that the subscribers should be traders nor will the fact that six of the subscribers are mere dummies, clerks or nominees of the seventh affect the validity of the company; so the House of Lords decided in *Salomon v. Salomon & Co.*, 1897, A. C. 22.

The document to be subscribed—the Memorandum of Association—corresponds, in the case of companies formed under the Companies Act 1862, to the charter or deed of settlement in the case of other companies. The form of it is given in the schedule to the act, and varies slightly according as the company is limited by shares or guarantee, or is unlimited. (See the 3rd schedule to the Consolidation Act 1908, forms A, B, C, D.) It is required to state, in the case of a company limited by shares, the five following matters:

1. The part of the United Kingdom, whether England, Scotland or Ireland, in which the registered office of the company is proposed to be situate.
2. The objects for which the proposed company is to be established.
3. A declaration that the liability of the members is limited.
4. The amount of capital with which the company proposes to be registered, divided into shares of a certain fixed amount. No subscriber of the memorandum is to take less than one share, and each subscriber is to write opposite his name the number of shares he takes.
5. These five matters the legislature has deemed of such intrinsic importance that it has required them to be set out in the

Memorandum of Association.
company's Memorandum of Association. They are the essential conditions of incorporation, and as such they must not only be stated, but the policy of the legislature has made them with certain exceptions unalterable.

The most important of these five conditions is the third, and its importance consists in this, that the objects defined in the memorandum circumscribe the sphere of the company's activities. This principle, which is one of public policy and convenience, and is known as the "ultra vires doctrine," carries with it important consequences, because every act done or contract made by a company ultra vires, i.e., in excess of its powers, is absolutely null and void. The policy, too, is a sound one. Shareholders contribute their money on the faith that it is to be employed in prosecuting certain objects, and it would be a violation of good faith if the company, i.e., the majority of shareholders, were to be allowed to divert it to something quite different. So strict is the rule that not even the consent of every individual shareholder can give validity to an ultra vires act.

The articles of association are the regulations for internal management of the company—the terms of the partnership agreed upon by the shareholders among themselves. A model or specimen set of articles known as Table A was given by the Companies Act 1862, and it is appended in a revised form to the Companies (Consolidation) Act 1908. When a company is to be registered the memorandum of association accompanied by a copy of the articles is taken to the office of the registrar of joint stock companies at Somerset House, together with the following documents:

1. A list of persons who have consented to be directors of the company (fee stamp 5s.).

2. A statutory declaration by a solicitor of the High Court engaged in the formation of the company, or by a person named in the articles of association as a director or secretary of the company, that the requisitions of the act in respect of registration and of matters precedent and incidental thereto have been complied with (fee stamp 5s.).

3. A statement as to the nominal share capital (stamped with an ad valorem duty of 5s. per £100).

4. If no prospectus is to be issued, a company must now (Companies Act 1907, s. 1; Consolidation Act 1908, s. 82) in lieu thereof file with the registrar a statement, in the form prescribed by the 1st schedule to the act, of all the material facts relating to the company. Till this has been done the company cannot allot any shares or debentures.

If these documents are in order the registrar registers the company and issues a certificate of incorporation (see Companies (Consolidation) Act 1908, sect. 82); on registration, the memorandum and articles of association become public documents, and any person may inspect them on payment of a fee of one shilling. This has important consequences, because every person dealing with the company is presumed to be acquainted with its constitution, and to have read its memorandum and articles. The articles also, upon registration, bind the company and its members to the same extent as if each member had subscribed his name and affixed his seal to them. The total capital of a company with a capital of £1,000 is about £7; £1,000,000 about £78.

The capital which is required to be stated in the memorandum of association, and which represents the amount which the company is empowered to issue, is what is known as the nominal capital. This nominal capital must be distinguished from the subscribed capital. Subscribed capital is the aggregate amount agreed to be paid by those who have taken shares in the company. Under the Companies Act 1900, Companies Act 1908, s. 83, a "minimum subscription" may be fixed by the articles, and if it is the directors cannot go to allotment on less; if it is not, then the whole of the capital offered for subscription must be subscribed. A company may increase its capital, consolidate it, subdivide it into shares of smaller amount and convert paid-up shares into stock. It may also, with the sanction of the court, otherwise reorganize its capital (Companies Act 1907, s. 39; Companies (Consolidation) Act 1908, s. 45), and for this purpose modify its Memorandum of Association; but a limited company cannot reduce its capital either by direct or indirect means without the sanction of the court. The inviolability of the capital is a condition of incorporation—the price of the privilege of trading with limited liability, and by no subterfuge will a company be allowed to evade this cardinal rule of policy, either by paying dividends out of capital, or buying its own shares, or returning money to shareholders. But the prohibition against reduction means that the capital must not be reduced by the voluntary act of the company, not that a company's capital must be kept intact. It is embarked in the company's business, and it must run the risks of such business. If part of it is lost there is no obligation on the company to replace it and to cease paying dividends until such lost capital is repaid. The company may in such a case write off the lost capital and go on trading with the reduced amount. But for this purpose the sanction of the court must be obtained by petition.

A share is an aliquot part of a company's nominal capital. The amount may be anything from £s. to £1,000. The tendency of late years has been to keep the denomination low, and to so appeal to a wider public. Shares of £100, or even £10, are now the exception. The most common amount is either £1 or £5. Shares are of various kinds—ordinary, preference, deferred, founders' and management. Into what classes of shares the original capital of the company shall be divided, what shall be the amount of each class, and their respective rights, privileges and priorities, are matters for the consideration of the promoters of the company, and must depend on its special circumstances and requirements.

A company may issue preference shares even if there is no mention of them in the Memorandum of Association, and any preference or special privilege so given to a class of shares cannot be interfered with on any reorganization of capital except by a resolution passed by a majority of shareholders of that class representing three-fourths of the capital of that class (Companies (Consolidation) Act 1908, s. 45). The preference given may be as to dividends only, or as to dividends and capital. The dividend, again, may be payable out of the year's profits only, or it may be cumulative, that is, a deficiency in one year is to be made good out of the profits of subsequent years. Prima facie, a preferential dividend is cumulative. For issuing preference shares the question for the directors is, what must be offered to attract investors. Preference shareholders are given by the Companies Act 1907, s. 23; Companies (Consolidation) Act 1908, s. 114, the right to inspect balance sheets. Founders' shares—which originated with private companies—are shares which usually take the whole or half the profits after payment of a dividend of 7 or 10% to the ordinary shareholders. They are much less in favour than they used to be.

The machinery of company formation is generally set in motion by a person known as a promoter. This is a term of business, not law. It means, to use Chief Justice Cockburn's words, a person "who undertakes to form a company with reference to a given project and to act it going, and who takes the necessary steps to accomplish that purpose." Whether what a person has done towards this end constitutes him a promoter or not, is a question of fact; but once an affirmative conclusion is reached, equity clothes such promoter with a fiduciary relation towards the company which he has been instrumental in creating. This doctrine is now well established, and its good sense is apparent when once the position of the promoter towards the company is understood. Promoters—to use Lord Cairns's language in Erlanger v. New Sombrero Phosphate Co., 3 A. C. 1256—"have in their hands the creation and moulding of the company. They have the power of defining how and when and in what shape and under what supervision it shall start into existence and begin to act as a trading corporation." Such a control over the destinies of the company involves correlative obligations towards it, and one of these obligations is that the promoter must not take advantage of the company's helplessness. A promoter
may sell his property to the company, but he must first see that the company is furnished with an independent board of directors to protect its interests and he must make full and fair disclosure of his interest in order that the company may be certain whether it will or will not authorize its trustee or agent (for such the promoter in equity is) to make a profit out of the sale. It is not a sufficient disclosure in such a case for the promoter merely to refer in the prospectus to a contract which, if read by the shareholders, would inform them of his interest. They are under no obligation to inquire. It is for the promoter to bring home notice, not constructively but actual, to the shareholders.

When a company is promoted for acquiring property—to work a mine or patent, for instance, or carry on a going business—the usual course is for the promoter to frame a draft agreement for the sale of the property to the company or to a trustee on its behalf. The memorandum and articles of the intended company are then prepared, and an article is inserted authorizing or requiring the directors to adopt the draft agreement for sale. In pursuance of this authority the directors at the first meeting after incorporation take the draft agreement into consideration; and if they approve, adopt it. Where they do so in the exercise of an honest and independent judgment, no exception can be taken to the transaction; but where the directors happen to be nominees of the promoter, perhaps qualified by him and acting in his interest, the situation is obviously open to grave abuse. It is not too much, indeed, to say that the fastening of an onerous or improvident contract on a company at its start, by interested promoters acting in collusion with the directors, has been the principal cause of the scandals associated with company promotion.

Concurrently with the adoption of the contract for the acquisition of the property which is the company’s raison d’être, the directors have to consider how they will best get the company’s capital subscribed. Down to the passing of the Companies Act 1900 the usual mode of doing this was to issue a prospectus inviting the public to subscribe for shares. After the act of 1900 the prospectus fell into general disuse. In the year 1903, out of a total of 356 companies which registered, only 338 issued a prospectus, the directors preferring, it would seem, to place the share capital through the medium of brokers, financial agents and other intermediaries rather than run the risk of incurring, personally, liability under the stringent provisions for disclosure contained in the act (s. 10). Of late the prospectus has, however, returned into favour. Under the act of 1907, incorporated in the Consolidation Act 1908 (s. 82), a company, if it does not issue a prospectus, must file a statement of all the material facts relating to the company’s business and objects,

A prospectus is an invitation to the public to take shares on the faith of the statements therein contained, and is thus the basis of the agreement to take the shares; there therefore rests on those who are responsible for its issue an obligation to act with the most perfect good faith—ubierrima fides—and this obligation has been repeatedly emphasized by judges of the highest eminence. (See the observations of Kindersley, V.C., in New Brunswick Railway Co. v. Muggeridge, 1860, 1 Dr. & Sm. 383, and of Lord Herschell in Derry v. Peek, 1889, 14 A. C. 376.) Directors must be perfectly candid with the public; they must not only state what they do state with strict and scrupulous accuracy, but they must not omit any fact which, if disclosed, would falsify the statements made. This is the general obligation of directors when issuing a prospectus; but on this general obligation the legislature has engrafted special requirements. By the Companies Act 1867, it required the dates and names of the parties to any contract entered into by the company or its promoters or directors before the issue of the prospectus, to be disclosed in the prospectus; otherwise the prospectus was to be deemed fraudulent. This enactment was repealed by the Companies Act 1900, but only in favour of more stringent provisions incorporated in the Consolidation Act of 1908. Now, not only is every prospectus to be signed and filed with the registrar of Joint Stock Companies before it can be issued, but the prospectus must set forth a long and elaborate series of particulars about the company—the contents of the Memorandum of Association, with the names of the signatories, the share qualification (if any) of the directors, the minimum subscription, on which the directors may proceed to allotment, the shares and debentures issued otherwise than for cash, the names and addresses of the vendors, the amount paid for underwriting the company, the amount of preliminary expenses, of promotion money (if any), and the interest (if any) of every director in the promotion or in property to be acquired by the company. Neglect of this statutory duty of disclosure will expose directors to personal liability. For false or fraudulent statements—as distinguished from non-disclosure—in a prospectus directors are liable in an action of deceit or under the Directors’ Liability Act 1890, now incorporated in the act of 1908. This act was passed to meet the decision of the House of Lords in Peek v. Derry (12 A. C. 337), that a director could not be made liable in an action of deceit for an untrue statement in a prospectus, unless the plaintiff could prove that the director had made the untrue statement fraudulently. The Directors’ Liability Act enacted in substance that when once a prospectus is proved to contain a material statement of fact which is untrue, the persons responsible for the prospectus are to be liable to pay compensation to any one who has subscribed on the faith of the prospectus, unless they can prove that they had reasonable ground to believe, and did in fact believe, the statement to be true. Conditions under this act have been rare, but their rarity may be due to the act having had the effect of making directors more careful in their statements.

Before the passing of the Companies Act 1900, it was a matter for directors’ discretion on what subscription they should go to allotment. They often did so on a scandalously inadequate subscription. To remedy this abuse the Companies Act 1900 (Companies (Consolidation) Act 1908, s. 85) provided that no allotment of any share capital offered to the public for subscription is to be made unless the amount fixed by the memorandum and articles of association and named in the prospectus as “the minimum subscription” upon which the directors may proceed to allotment has been subscribed and the application monies—which must not be less than 5% of the nominal amount of the share—paid to and received by the company. If no minimum is fixed the whole amount of the share capital offered for subscription must have been subscribed before the directors can go to allotment. The “minimum subscription” is to be reckoned exclusively of any amount payable otherwise than in cash. If these conditions are not complied with within forty days the application monies must be returned. Any “waiver clause” or contract to waive compliance with the section is to be void.

An allotment of shares made in contravention of these provisions is irregular and voidable at the option of the applicant for shares within one month after the first or statutory meeting of the company (Companies (Consolidation) Act, s. 86). Even when a company has got what under the name of the “minimum subscription” the directors deem enough capital for its enterprise, it cannot now commence business or make any binding contract or exercise any borrowing powers until it has obtained a certificate entitling it to commence business (Companies (Consolidation) Act 1908, s. 87). To obtain this certificate the company must have fulfilled certain statutory conditions, which are briefly these:

(a) The company must have allotted shares to the amount of not less than the “minimum subscription.”
(b) Every director must have paid up the shares in the same proportion as the other members of the company.
(c) A statutory declaration, made by the secretary of the company or one of the directors, must have been filed with the register of joint stock companies, that these conditions have been complied with.

These conditions fulfilled, the company gets its certificate and starts on its business career, carrying on its business through the agency of directors, as to whose powers and duties see DIRECTORS.

The Companies Act as consolidated in the act of 1908, and
the regulations under them, treat the directors of a company as  
the persons in whom the management of the com-
pány's affairs is vested. But they also contemplate the  
ultimate controlling power as residing in the sharehold-
ers. A controlling power of this kind can only assert itself through  
general meetings; and that it may have proper opportunities  
of doing so, every company is required to hold a general meeting,  
commonly called the statutory meeting, within—as fixed by the  
Companies Act 1900—three months from the date at which  
it is entitled to commence business. This first statutory meeting  
acquired new significance under the Companies Act of 1900 and  
marks an important stage in the early history of a company.  
Seven days before it takes place the directors are required  
to send round to the members a certified report informing them  
of the general state of the company's affairs—the number of  
shares allotted, cash received for them, and names and addresses  
of the members, the amount of preliminary expenses, the  
particulars of any contract to be submitted to the meeting, &c.  
Furnished with this report the members come to the meeting  
in a position to discuss and exercise an intelligent judgment  
upon the state and prospects of the company. Besides the  
statutory meeting a company must hold one general meeting  
at least—every calendar year, and not more than fifteen months  
after the holding of the last preceding general meeting (Com-
panies (Consolidation) Act 1908, s. 64). This annual general  
meeting is usually called the ordinary general meeting. Other  
meetings are extraordinary general meetings. Notices convening  
a general meeting must inform the shareholders of the particular  
business to be transacted; otherwise any resolutions passed at  
the meeting will be invalid. Voting is generally regulated by  
the articles. Sometimes a vote is given to a shareholder for  
every share held by him, but more often a scale is adopted;  
for instance, one vote is given for every share up to ten, with  
an additional vote for every five shares beyond the first ten shares  
up to one hundred, and an additional vote for every ten shares  
beyond the first hundred. In default of any regulations, every  
member has one vote only. Sometimes preference shareholders  
are given no vote at all. A poll may be demanded on any  
special resolution by three persons unless the articles require  
five (Companics (Consolidation) Act 1908, s. 69).  

A contract to take shares is like any other contract. It is  
constituted by offer, acceptance and communication of the  
acceptance to the offerer. The offer in the case of  
shores for shares.  

Agreement  

shares is usually in the form of an application in  
writing to the company, made in response to a pro-
spectus, requesting the company to allot the applicant a certain  
number of shares in the undertaking on the terms of the pro-
spectus, and agreeing to accept the shares, or any smaller  
number, which may be allotted to the applicant. An allottee  
is under the Companies (Consolidation) Act 1908, s. 86, entitled  
to rescind his contract where the allotment is irregular, e.g.  
where the minimum subscription has not been obtained. When  
an application is accepted the shares are allotted, and a letter  
of allotment is posted to the applicant. Allotment is the usual,  
but not the only, evidence of acceptance. As soon as the letter  
of allotment is posted the company must serve the letter upon the applicant. An application for shares  
can be withdrawn at any time before acceptance. As soon as  
the contract is complete, it is the duty of the company to enter  
the shareholder's name in the register of members, and to issue  
to him a certificate under the seal of the company, evidencing  
his title to the shares.  

The register of members plays an important part in the  
scheme of the company system, under the Companies Act 1862.  
The principle of limited liability having been once  
adopted by the legislature, justice required not only  
that such limitation of liability should be brought home by  
every possible means to persons dealing with the company,  
but also that such persons should know as far as  
possible what was the limited capital which was the sole fund  
available to satisfy their claims—what amount had been called  
up, what remained uncalled, who were the persons to pay,  
and in what amounts. These data might materially assist  
a person dealing with the company in determining whether  
he would give it credit or not; in any case they are matters  
which the public had a right to know. The legislature, recog-
nizing this, has exacted as a condition of the privilege of trading  
with limited liability that the company shall keep a register  
with those particulars in it, which shall be accessible to the public  
at all reasonable times. In order that this register may be  
accurate, and correspond with the true liability of membership  
for the time being, the court is empowered under the Companies  
Act 1862, and the Companies (Consolidation) Act 1908, s. 32,  
to rectify it in a summary way, on application by motion, by  
ordering the name of a person to be entered on or removed  
therefrom. This power can be exercised by the court, whether  
the dispute as to membership is one between the company  
and an alleged member, or between one alleged member and  
another, but the machinery of the section is not meant to be  
used to try claims to rescind agreements to take shares. The  
proper proceeding in such cases is by action.  

The same policy of guarding against an abuse of limited  
liability is evidenced in the Companies Act 1862, which required  
that shares in the case of a limited company should be  
repealed for in full. The legislature has allowed share-
such companies to trade with limited liability, but  
the price of the privilege is that the limited capital to which  
alone the creditors can look shall at least be a reality. It  
is therefore ultra vires for a limited company to issue its shares at  
a discount; but there was nothing in the Companies Act 1862  
which required that the shares of a limited company, though  
they must be paid up in full, must be paid up in cash. They  
might be paid "in meal or in malt," and it accordingly became  
common for shares to be allotted in payment for furniture,  
plate, advertisements or services. The result was that the  
consideration was often illusory, shares being issued to pay  
for in some commodity which had no certain criterion of value.  
To remedy this evil the legislature enacted in the Companies  
Act 1867, s. 23, that every share in any company should be  
held subject to the payment of the whole amount thereof in  
cash for them. Unless otherwise determined by a contract in writing filed  
with the registrar of joint stock companies at or before the issue  
of the shares. This section not infrequently caused hardship  
where shares had been honestly paid for in the equivalent of  
cash, but owing to inadvertence no contract had been filled;  
and it was repealed by the Companies Act 1900, and the old law  
restored. In reverting to the earlier law, and allowing shares  
to be paid for in any adequate consideration, the legislature  
has, however, exacted a safeguard. It has required the company  
to file with the registrar of joint stock companies a return  
stating, in the case of shares allotted in whole or in part for  
a consideration other than cash, the number of the shares so  
allotted, and the nature of the consideration—property, services,  
&c.—for which they have been allotted.  

Though every share carries with it the liability to pay up  
the full amount in cash or its equivalent, the liability is only to pay  
when and if the directors call for it to be paid up. A call must  
fix the time and place for payment, otherwise it is bad.  

When a person takes shares from a company on the faith of a  
prospectus containing any false or fraudulent representations  
of fact material to the contract, he is entitled to rescind  
the contract. The company cannot keep a contract  
obtained by the misrepresentation or fraud of its  
agents. This is an elementary principle of law.  

The misrepresentation, for purposes of rescission, need not  
be fraudulent; it is sufficient that it is false in fact: fraud  
or recklessness of assertion will give the shareholder a further  
remedy by action of deceit, or under the Directors' Liability Act  
1890 (see supra); but, to entitle a shareholder to rescind, he  
must show that he took the shares on the faith or partly on  
the faith of the false representation: if not, it was innocuous.  
A shareholder claiming to rescind must do so promptly. It  
is too late to commence proceedings after a winding-up has  
begun.
The shares or other interest of any member in a company are personal estate and may be transferred in the manner provided by the regulations of the company. As Lord Blackburn said, one of the chief objects when joint stock companies were established was that the shares should be capable of being easily transferred; but though every shareholder has a prima facie right to transfer his shares, this right is subject to the regulations of the company, and the company may and usually does by its regulations require that a transfer shall receive the approval of the board of directors before being registered,—the object being to secure the company against having an insolvent or undesirable shareholder (the nominee perhaps of a rival company) substituted for a solvent and acceptable one. This power of the directors to refuse a transfer must not, however, be exercised arbitrarily or capriciously. If it were, it would amount to a confiscation of the shares. Directors, for instance, cannot veto a transfer because they disapprove of the purpose for which it is being made (e.g. to multiply votes), if there is no objection to the transferee.

When this is done the share or stock certificate is usually accompanied by a blank transfer—that is, a transfer executed by the shareholder borrower, but with a blank left for the name of the transferee. The hounding over by the borrower of such blank transfer signed by him is an implied authority to the banker, or other pledgee, if the loan is not paid, to fill in the blank with his name and get himself registered as the owner.

A company can only pay dividends out of profits—which have been defined as the "earnings of a concern after deducting the expenses of earning them." To pay dividends out of capital is not only ultra vires but illegal, as constituting a return of capital to shareholders. Before paying dividends, directors must take reasonable care to secure the preparation of proper balance-sheets and estimates, and must exercise their judgment as business men on the balance-sheets and estimates submitted to them. If they fail to do this, and pay dividends out of capital, they will not be held excused, unless the court should think that they ought to be under the new discretion given to the court by ss. 32-34 of the Companies Act 1907 (Companies (Consolidation) Act 1908, s. 279). The onus is on them to show that the dividends have been paid out of profits. The court as a rule does not interfere with the discretion of directors in the matter of paying dividends, unless they are doing something ultra vires.

By the Companies (Consolidation) Act 1908, ss. 112, 113, incorporating provisions of the act of 1900 (ss. 21-23), as amended by the act of 1907 (s. 19), the legislature has made strict provisions for the appointment and remuneration of auditors by a company, and has defined their rights and duties. Prior to the act of 1900 audit clauses, except in the case of banking companies, were left to the articles of association and were not matter of statutory obligation.

The "private company" may best be described as an incorporated partnership. The term is statutorily defined for the first time—by ss. 37 of the Companies Act 1907 (s. 121 of the Consolidating Act of 1908). Individual traders and trading firms have in recent years become much more alive to the advantages offered by incorporation. They have discovered that incorporation gives them the protection of limited liability; that it prevents dislocation of a business by the death, bankruptcy or lunacy of any of its members; that it enables a trader to distribute among the members of his family interests in his business on his decease through the medium of shares; that it facilitates borrowing on debentures or debenture stock, and with a view to secure these advantages thousands of traders have converted their businesses into limited companies. To so large an extent has this been done that private companies now form one-third of the whole number of companies registered.

A private company does not appeal to the public to subscribe its capital, but in the main features of its constitution a private company differs little from a public one. It is only in one or two particulars that special provisions are requisite. It is generally desired for instance: (1) to keep all the shares among the members—the partners or the family—and not to let them get into the hands of the public; and (2) to give the principal shareholders, the original partners, a paramount control over the management. For this purpose it is usual to provide specially in the articles that no share shall be transferred to a stranger so long as any member is willing to purchase it at a fair value; that a member desirous of transferring his shares shall give notice to the company; that the company shall offer the shares to the other members; that if within a certain period the company finds a purchaser the shares shall be transferred to him, and that in case of dispute the value shall be settled by arbitration or shall be such a sum as the auditor certifies to be in his opinion the fair value. So in regard to the management it is common to provide that the owner or owners of the business shall be entitled to hold office as directors for a term of years or for life, provided he or they continue to hold a certain number of shares; or an owner is empowered to authorize his executors or trustees whilst holding a certain number of shares to appoint directors. Directors holding office on these special terms are described as "governing" or "permanently" or "life" directors. This union of interest and management in the same persons gives a private company an unquestionable advantage over a public company.

The so-called "one-man company" is merely a variety of the private company. The fact that a company is formed by one man, with the aid of six dummy subscribers, is not in itself (as was at one time supposed) a fraud on the policy of the Companies Act, but it is occasionally used for the purpose of committing a fraud, as where an insolvent trader turns himself into a limited company in order to evade bankruptcy; and it is to an abuse of this kind that the term "one-man company" owes its opprobrious signification.

Companies Limited by Guarantee.—The second class of limited companies are those limited by guarantee, as distinguished from those limited by shares. In the company limited by guarantee each member agrees, in the event of a winding-up, to contribute a certain number of shares to the company. The peculiarity of this form of company is that the interests of the members of a guarantee company are not expressed in any terms of nominal money value like the shares of other companies, a form of constitution designed, as stated by Lord Thring, the draftsman of the Companies Act 1862, to give a superior elasticity to the company. The property of the company simply belongs to the company in certain fractional amounts. This makes it convenient for clubs, syndicates and other associations which do not require the interest of members to be expressed in terms of cash.

Companies not for Gain.—Associations formed to promote commerce, art, science, religion, charity or any other useful object may, with the sanction of the Board of Trade, register under the Companies Act 1862, with limited liability, but without the addition of the word "Limited," upon proving to the board that it is the intention of the association to apply the profits or income of the association in promoting its objects, and not in payment of dividends or remuneration of its members (C.A. 1867, s. 2). This licence was made revocable by s. 42 of the Companies Act 1907 (Consolidation Act of 1908, ss. 9, 20). In lieu of the word "Company," the association may adopt as part of its name some such title as chamber, club, college, guild, institute or society. The power given by this section has proved very useful, and many kinds of associations have availed themselves of it, such as medical institutes, law societies, nursing homes, chambers of commerce, clubs, high schools, archaeological, horticultural and philosophical societies. The guarantee form (see supra) is well adapted for associations of this kind intended as they usually are to be supported by annual subscriptions. No such association can hold more than two acres of land without the licence of the Board of Trade.

Cost-Book Mining Companies.—These are in substance mining partnerships. They derive their name from the fact of
the partnership agreement, the expenses and receipts of the mine, the names of the shareholders, and any transfers of shares being entered in a "cost-book." The affairs of the company are managed by an agent known as a "purser," who from time to time makes calls on the members for the expenses of working. A cost-book company is not bound to register under the Companies Act 1862, but it may do so.

A company once incorporated under the Companies Act 1862 cannot be put an end to except through the machinery of a winding-up, though the name of a company which is commercially defunct may be struck off the register of joint stock companies by the registrar (s. 247 of the Companies (Consolidation) Act 1908, incorporating s. 7 of the act of 1880, as amended by s. 26 of the act of 1900). Winding-up is of two kinds: (1) voluntary winding-up, either purely voluntary or carried on under the supervision of the court; and (2) winding-up by the court. Of these voluntary winding-up is by far the more common. Of the companies that come to an end 90% are so wound up, and this is in accordance with the policy of the legislature, evinced throughout the Companies Acts, that shareholders should manage their own affairs—winding-up being one of such affairs. A voluntary winding-up is carried out by the shareholders passing a special resolution requiring the company to be wound up voluntarily, or an extraordinary resolution (now defined by s. 182 of the Companies (Consolidation) Act 1908) to the effect that it has been proved to the shareholders' satisfaction that the company cannot, by reason of its liabilities, continue its business, and that it is advisable to wind it up (C.A. 1862, s. 129). The resolution is generally accompanied by the appointment of a liquidator. In a purely voluntary winding-up there is a power given by s. 38 for the company or any contributory to apply to the court in any matter arising in the winding-up, but seemingly by an oversight of the legislature the same right was not given to creditors.

This was rectified by the Companies Act 1900, s. 25 Section 27 of the Companies Act 1907 (s. 188 of the Consolidation Act 1908) further provides for the liquidator under a voluntary winding-up summoning a meeting of creditors to determine on the choice of a liquidator. A creditor may also in a proper case obtain an order for continuing the voluntary winding-up under the supervision of the court. Such an order has the advantage of operating as a stay of any actions or executions pending against the company. Except in these respects, the winding-up remains a voluntary one. The court does not actively intervene unless set in motion; but it requires the liquidator to bring his accounts into charge every six months so that it may be informed how the liquidation is proceeding. When the affairs of the company are fully wound up, the liquidator calls a meeting, lays his accounts before the shareholders, and the company is dissolved by operation of law three months after the date of the meeting (C.A. 1862, ss. 142, 143).

Irrespective of voluntary winding-up, the legislature has defined certain events in which a company formed under the Companies Act 1862 may be wound up by the court.

These events are: (1) when the company has passed a resolution requiring the company to be wound up by the court; (2) when the company does not commence its business within a year or suspends it for a year; (3) when the members are reduced to less than seven; (4) when the company is unable to pay its debts, and (5) whenever the court is of opinion that it is just and equitable that the company should be wound up (C.A. 1862, s. 79; s. 129 of the Consolidation Act 1908). A petition for the purpose may be presented either by a creditor, a contributory, or the company itself. Where the petition is presented by a creditor who cannot obtain payment of his debt, a winding-up order is ex debito justitiae as against the company or shareholders, but not as against the wishes of a majority of creditors. A winding-up order is not to be refused because the company's assets are over mortgaged (Companies Act 1907, s. 20; s. 141 of Consolidation Act 1908).

The procedure on the making of a winding-up order is now governed by ss. 7, 8, 9 of the Winding-up Act 1890. The official receiver, as liquidator pro tem., requires a statement of the affairs of the company verified by the directors, and on it reports to the court as to the causes of the company's failure and whether further inquiry is desirable. If he further reports that in his opinion fraud has been committed in the promotion or formation of the company by a particular person, the court may order such person to be publicly examined.

A liquidator's duty is to protect, collect, realize and distribute the company's assets in due course of administration; and for this purpose he advertises for creditors, makes calls on contributories, sues debtors, takes misfeasance proceedings, if necessary, against directors or promoters, and carries on the company's business—supposing the goodwill to be an asset of value—with a view to selling it as a going concern. He may be assisted, like a trustee in bankruptcy, by a committee of inspection, composed of creditors and contributories.

When the affairs of the company have been completely wound up the court is, by s. 111 of the Companies Act 1862 (s. 127 of the act of 1908), to make an order that the company be dissolved from the date of such order, and the company is dissolved accordingly. A company which has been dissolved may, where necessary, on petition to the court be reinstated on the register (Companies Act 1880, s. 1).

A large number of companies now wind up only to reconstruct. The reasons for a reconstruction are generally either to raise fresh capital, or to get rid of onerous preference shares, or to enlarge the scope of the company's objects, which is otherwise impracticable owing to the unalterability of the Memorandum of Association. Reconstructors are carried out in one of three ways: (1) by sale and transfer of the company's undertaking and assets to a new company, under a power to sell contained in the company's memorandum of association, or (2) by sale and transfer under s. 161 of the Companies Act 1862; or (3) by a scheme of arrangement, sanctioned by the court, under the Joint Stock Companies Arrangements Act 1870, as amended by the Companies Act 1907, s. 38 (C.A. 1908, s. 192).

The first of these modes is now the most in favour.

A company, though a mere legal abstraction, without mind or will, may, it is now well settled, be liable in damages for malicious prosecution, for nuisance, for fraud, for negligence, for trespass. The sense of the thing is that the "company" is a nomen collectivum for the members. It is they who have put the directors there to carry on their business and they must be answerable, collectively, for what is done negligently, fraudulently or maliciously by their agents.

2. Public Companies.

Besides trading companies there is another large class, exceeding in their number even trading companies, which for shortness may be called public companies, that is to say, companies constituted by special act of parliament for the purpose of constructing and carrying on undertakings of public utility, such as railways, canals, harbours, docks, waterworks, gasworks, bridges, ferries, tramways, drainage, fisheries or hospitals. The objects of such companies nearly always involve an interest with the rights of private persons, often necessitate the commission of a public nuisance, and require therefore the sanction of the legislature. For this purpose a special act has to be obtained. A private bill to authorize the undertaking is introduced before one or other of the Houses of Parliament, considered in committee, and either passed or rejected like a public bill. These parliamentary (private bill) committees are tribunals acknowledging certain rules of policy, taking evidence from witnesses and hearing arguments from professional advocates. In many of these special acts, dealing as they do with a similar subject matter, similar provisions are required, and to avoid repetition and secure uniformity the legislature has passed certain general acts—codes of law for particular subject matters frequently recurring—which can be incorporated by reference in any special act with the necessary modifications. Thus the
COMPANY

The status of British companies trading abroad, so far as Germany, France, Belgium, Greece, Italy and Spain are concerned, is expressly recognized in a series of conventions entered into between those countries and Great Britain. The value of the convention with France has been much impaired by the interpretation put upon the words of it by the court of cassation in *La Construction Lim.* According to this court the nationality of a company depends not on its place of origin but on where it has its centre of affairs, its principal establishment. The result is that a company registered in Britain under the Companies Acts may be transmuted by a French court into a French company in direct violation of the convention. The convention with Germany, which is in similar terms to that with France, has also been narrowed by judicial construction. The "power of exercising all their rights" given the convention to British companies has been construed to mean that a British company will be recognized as a corporate body in Germany, but it does not follow from the terms of the convention that any British company may as a matter of course establish a branch and carry on business within the German empire. It must still get permission to trade, permission to hold land. It must register itself in the communal register. It must pay stamp duties.

Foreign companies may found an affiliated company or have a branch establishment in Italy, provided they publish their memorandum and articles and the names of their directors. Where no convention exists the status of an immigrant corporation depends upon international comity, which allows foreign corporations, as it does foreign persons, to sue, to make contracts and hold real estate, in the same way as domestic corporations or citizens; provided the stranger corporation does not offend against the policy of the state in which it seeks to trade.

There is, however, a growing practice now for states to impose by express legislation conditions on foreign corporations coming to do business within their territory. These conditions are mainly directed to securing that the immigrant corporation shall make known its constitution and shall be amenable to the jurisdiction of the courts of the country where it trades. Thus, by the law of Western Australia—to take a typical instance,—a foreign company is not to commence or carry on business until it empowers some person to act as its attorney to sue and be sued and has an office or place of business within the state, to be approved of by the registrar, where all legal proceedings may be served. New Zealand, Manitoba and many other states have adopted similar precautions; and by the Companies Act 1907, s. 35; C.A. 1908, s. 274 foreign companies having a place of business within the United Kingdom are required to file with the registrar of joint stock companies a copy of the company's charter or memorandum and articles, a list of directors, and the names and addresses of one or more persons authorized to accept service of process. Special conditions of a more stringent nature are often imposed in the case of particular classes of companies of a quasi-public character, such as banking companies, building societies or insurance companies. Regulations of this kind are perfectly legitimate and necessary. They are in truth only an application of the law of vagrancy to corporations, and have their analogy in the restrictions now generally imposed by states on the immigration of aliens.

4. Company Law outside the United Kingdom.

Australia.—Company law in Australia and in New Zealand follows very closely the lines of company legislation in the United Kingdom.

In New South Wales the law is consolidated by Act No. 40 of 1899, amended 1900 and 1906. In Victoria the law is contained in the Acts Nos. 1074 of 1890 and 355 of 1896; in Queensland in a series of Acts—No. 4 of 1863, No. 18 of 1899, No. 10 of 1891, No. 24 of 1892, No. 3 of 1893, No. 19 of 1904 and No. 21 of 1860; in South Australia in Act No. 50 of 1892, amended by No. 576 of 1893; in Tasmania by Nos. 22 of 1896, 19 of 1895 and 3 of 1896; in Western Australia by No. 8 of 1893, amended 1897 and 1898.

In New Zealand the law was consolidated in 1905.

Canada.—The act governing joint stock companies in Canada is the Companies Act 1902, amended 1904. It empowers the secretary of state by letters patent to grant a charter to any number of persons not less than five for any objects other than railway or telegraph lines, banking or insurance.

Applicants must file an application—alogous to the British memorandum of association—showing certain particulars—the purposes of incorporation, the place of business, the amount of the capital stock, the number of shares and the amount of each, the names and addresses of the applicants, the amount of stock taken by each and the amount and mode of payment. Other provisions may also be embodied. A company cannot commence business until 10% of its authorized capital has been subscribed and paid for. The word "limited" as part of the company's name is—as in the case of British companies—to be conspicuously exhibited and used in all documents. The directors are not to be less than three or more than fifteen, and must be holders of stock. Directors are jointly and severally liable to the clerks, labourers and servants of the company for six months' wages. Borrowing powers may be taken by a vote of holders of two-thirds in value of the subscribed stock of the company.

South Africa.—In Cape Colony the law is contained in No. 25 of 1892, amended 1895 and 1906; it follows English law.

In Natal the law is contained in Nos. 10 of 1864, 18 of 1865, 19 of 1893 and 3 of 1896.

In the Orange Free State in Law Ch. 100 and Nos. 2 and 4 of 1892.

For the Transvaal see Nos. 5 of 1874, 6 of 1874, 1 of 1894 and 30 of 1904.

In Rhodesia companies are regulated by the Companies Ordinance 1857—a combination of the Cape Companies Act 1892, and the British Companies Acts 1862-1890.

French.—There are two kinds of limited liability companies in France—the société en commandite and the société anonyme. The société en commandite corresponds in some respects to the British private company or limited partnership, but with this difference, that in the société en commandite the managing partner is under unlimited liability of creditors; the sleeping partner's liability is limited to the amount of his capital. The French equivalent of the English ordinary joint stock company is the société anonyme. The minimum number of subscribers necessary to form such a company is (as in the case of a British trading company) seven, but, unlike a British company, the société anonyme is not legally constituted unless the whole capital is subscribed and one-fourth of each share paid up. Another precaution unknown to British practice is that assets, not in money, brought into a company are subject to verification of value by a general meeting. The minimum nominal value of shares, where the company's capital is less than 200,000 francs, is 25 francs.; where the capital is more than 200,000 francs, 100 francs. The société is governed by articles which appoint the directors, and there is one general meeting held every year. A société anonyme may, since 1902, issue preference shares. The doctrine
that a corporation never dies has no place in French law. A 

société anonyme may come to an end.

Germany.—In Germany the class of companies most nearly 
corresponding to English companies limited by shares are 
"share companies" (Aktiengesellschaften) and "commandite 
companies" with a share capital (Kommanditgesellschaften auf 
Aktion). Since 1892 a new form of association has come into 
existence known by the name of partnership with limited 
liability (Gesellschaften mit beschränkter Haftung), which has 
largely superseded the commandite company.

The "share 
company." In forming this paid-up company certain preliminary 
steps have to be taken before registration:—

1. The articles must be agreed on;
2. A managing board and a board of supervision must be appointed;
3. The whole of the share capital must be allotted and 25%, at 
least, must be paid up in coin or legal tender notes;
4. Reports on the formation of the company must be made by 
certain persons; and
5. Certain documents must be filed in the registry.

In all cases where shares are issued for any consideration, 
not being payment in full in cash, or in which contracts for 
the purchase of property have been entered into, the promoters 
must sign a declaration in which they must state on what grounds 
the prices agreed to be given for such property appear to be 
justified. In the great majority of cases shares are issued in 
certificates to bearer. The amount of such a share—to bearer— 
must as a general rule be not less than £50, but registered shares 
of £10 may be issued. Balance sheets have to be published 
periodically.

Partnerships with limited liability may be formed by two or 
more members. The articles of partnership must be signed by 
all the members, and must contain particulars as to 
the amount of the capital and of the individual shares. 
If the liability on any shares is not to be satisfied in 
cash this also must be stated. The capital of a limited 
partnership must amount to £1,000. Shares must be registered.

Insolvent companies in Germany are subject to the bankruptcy 
law in the same manner as natural persons.

For further information see a memorandum on German 
companies printed in the appendix to the Report of Lord 
Diosy's Commission on the Law of Business Corporations in 
Great Britain and Ireland (1854), p. 1176.

Italy.—Commercial companies in Italy are of three kinds:—

(1) General partnerships, in which the members are liable for 
all debts incurred; (2) companies in accomodita, in which some 
members are liable to an unlimited extent and others within 
certain limits; (3) joint stock companies, in which the liability 
is limited to the capital of the company and no member is liable 
beyond the amount of his holding. None of these companies 
needs authority from the government for its constitution; all 
that is needed is a written agreement brought before the public 
in the ways indicated in the code (Art. 90 et seq.). In joint stock 
companies the trustees (directors) must give security. They are 
appointed by a general meeting for a period not exceeding four 
years (Art. 124). The company is not constituted until the whole 
of its capital is subscribed, and until three-tenths of the capital 
at least has been actually paid up. When a company's capital 
is diminished by one-third, the trustees must call the members 
together and consult as to what is to be done.

An ordinary meeting is held once at least every year. Shares 
may not be mortgaged "in specie" until fully paid up 
(Art. 176). A company may issue debentures if this is agreed to 
by a certain majority (Art. 172). One-twentieth, at least, of 
the dividends of the company must be added to the reserve fund, 
until this has become equal to one-fifth of the company's capital 
(Art. 182). Three or five assessors—members or non-members— 
keep watch over the way in which the company is carried on.

United States.—In the United States the right to create 
corporations is a sovereign right, and as such is exercisable by 
the several states of the Union. The law of private corporations 
must therefore be sought in some fifty collections or groups of 
statutory and case-made rules. These collections or groups of 
rules differ in many cases essentially from each other. The acts 
regulating business corporations generally provide that the 
persons proposing to form a corporation shall sign and 
acknowledge an instrument called the articles of association, setting 
forth the name of the corporation, the object for which it is 
to be formed, the principal place of business, the amount of its 
capital stock, and the number of shares into which it is to be 
divided, and the duration of its corporate existence. These 
articles are filed in the office of the secretary of state or in 
designated courts of record, and a certificate is then issued 
reciting that the provisions of the act have been complied with, 
and thereupon the incorporators are vested with corporate 
existence and the general powers incident thereto. This 
certificate is the charter of the corporation. The power to make 
bylaws is usually vested in the stockholders, but it may be 
conferred by the certificate on the directors. Stockholders 
remain liable until their subscriptions are fully paid. Nothing 
but money is considered payment of capital stock except where 
property is purchased. Directors must usually be stockholders.

The right of a state to forfeit a corporation's charter for 
misuser or non-user of its franchises is an implied term of the 
grant of incorporation. Corporations are liable for every 
wrong which they commit; and in such cases cannot set up by way of 
protection the doctrine of ultra vires.

See authorities—Comparative Law of Private Corporations, 
by Seymour D. Thompson, L.L.D., 6 vols.; Beach on 
Corporations, and the American Encyclopaedia of Law.

(E. MA.)

COMPARATIVE ANATOMY, a term employed to designate the 
study of the structure of man as compared with that of lower 
animals, and sometimes the study of lower animals in contra-
distinction to human anatomy; the term is now falling into 
desuetude, andingers practically only in the titles of books or in 
the designation of university chairs. The change in terminology 
is chiefly the result of modern conceptions of zoology. From 
the point of view of structure, man is one of the animals; all 
investigations into anatomical structure must be comparative, 
and in this work the subject is so treated throughout. See 
ANATOMY and ZOOLOGY.

COMARETTI, DOMENICO (1835- ), Italian scholar, was 
born at Rome on the 27th of June 1835. He studied at 
the university of Rome, took his degree in 1855 in natural science 
and became a professor of zoology and anatomy. His 
scanty leisure was, however, given to study. He learned 
Greek by himself, and gained facility in the modern language 
by conversing with the Greek students at the university. 
In spite of all disadvantages, he not only mastered the language, 
but became one of the chief classical scholars of Italy. In 1857 
he published, in the Rheinisches Museum, a translation of some 
recently discovered fragments of Hypereides, with a dissertation 
on that orator. This was followed by a notice of the annalist 
Granius Licinianus, and one on the oration of Hypereides on 
the Lamin War. In 1859 he was appointed professor of Greek 
at Pisa on the recommendation of the duke of Sermontia. A 
few years later he was called to a similar post at Florence, 
remaining eminens professor at Pisa also. He subsequently 
took up his residence in Rome as lecturer on Greek antiquities 
and greatly interested himself in the Forum excavations. 
He was a member of the governing bodies of the academies 
of Milan, Venice, Naples and Turin. The list of his writings 
is long and varied. Of his works in classical literature, the 
best known are an edition of the Enquiries of Hypereides, and 
monographs on Pindar and Sappho. He also collected the Latin 
inscription which contains a collection of the municipal laws 
of Gortyn in Crete, discovered on the site of the ancient city. In 
The Kalewala and the Traditional Poetry of the Finns (English 
translation by I. M. Anderton, 1898) he discusses the national 
epic of Finland and its heroic songs, with a view to solving 
the problem whether an epic could be composed by the interweaving 
of such national songs. He comes to a negative conclusion, 
and applies this reasoning to the Homeric problem. He treats 
this question again in a treatise on the so-called Peisistratean edition of Homer (La Commissione omicrò di Pisistrato, 1881). His 
Researches concerning the Book of Sindibad have been translated
in the *Proceedings of the Folk-Lore Society*. His *Vergil in the Middle Ages* (translated into English by E. F. Benecke, 1895) traces the strange vicissitudes by which the great Augustan poet became successively grammatical fetich, Christian prophet and wizard. Together with Professor Alessandro d’Ancona, Comparetti edited a collection of Italian national songs and stories (9 vols., Turin, 1870-1891), many of which had been collected and written down by himself for the first time.

**COMPASS** (Fr. *compas*, ultimately from Lat. *cump*, with, and *passus*, step), a term of which the evolution of the various meanings is obscure; the general sense is "measure" or "measurement," and the word is used thus in various derived meanings—area, boundary, circuit. It is also more particularly applied to a mathematical instrument ("pair of compasses") for measuring or for describing a circle, and to the mariner’s compass.

The mariner's compass, with which this article is concerned, is an instrument by means of which the directive force of that great magnet, the Earth, upon a freely-suspended needle, is utilized for a purpose essential to navigation. The needle is so mounted that it only moves freely in the horizontal plane, and therefore the horizontal component of the earth's force alone directs it. The direction assumed by the needle is not generally towards the geographical north, but diverges towards the east or west of it, making a horizontal angle with the true meridian, called the magnetic variation or declination; amongst mariners this angle is known as the variation of the compass.

In the usual navigable waters of the world the variation alters from $30^\circ$ to the east to $45^\circ$ to the west of the geographical meridian, being westerly in the Atlantic and Indian oceans, easterly in the Pacific. The vertical plane passing through the longitudinal axis of such a needle is known as the magnetic meridian. Following the first chart of lines of equal variation compiled by Edmund Halley in 1700, charts of similar type have been published from time to time embodying recent observations and corrected for the secular change, thus providing seamen with values of the variation accurate to about $30^\circ$ of arc. Possessing these data, it is easy to ascertain by observation the effects of the iron in a ship in disturbing the compass, and it will be found for the most part in every vessel that the needle is deflected from the magnetic meridian by a horizontal angle called the deviation of the compass; in some directions of the ship's head adding to the known variation of the place, in other directions subtracting from it. Local magnetic disturbance of the needle due to magnetic rocks is observed on land in all parts of the world, and in certain places extends to the land under the sea, affecting the compasses on board the ships passing over it. The general direction of these disturbances in the northern hemisphere is an attraction of the north-seeking end of the needle; in the southern hemisphere, its repulsion. The approaches to Cossack, North Australia; Cape St Francis, Labrador; the coasts of Madagascar and Iceland, are remarkable for such disturbance of the compass.

The compass as we know it is the result of the necessities of navigation, which have increased from century to century. It consists of five principal parts—the card, the needles, the bowl, a jewelled cap and the pivot. The card or "fly," formerly made of cardboard, now consists of a disk either of mica covered with paper or of paper alone, but in all cases the card is divided into points and degrees as shown in fig. 1. The outer margin is divided into degrees with $0^\circ$ at north and south, and $90^\circ$ at east and west; the 32 points with half and quarter points are seen immediately within the degrees. The north point is marked with a *fleur de lis*, and the principal points, N.E., E., S.E., &c., with their respective names, whilst the intermediate points in the figure have also their names engraved for present information. The arc contained between any two points is $11^\circ$ 5'. The mica card is generally mounted on a brass framework, F F, with a brass cap, C, fitted with a sapphire centre and carrying four magnetized needles, N, N, N, N, as in fig. 2. The more modern form of card consists of a broad ring of paper marked with degrees and points, as in fig. 1, attached to a frame like that in fig. 3, where an outer aluminium ring, A A, is connected by 32 radial silk threads to a central disk of aluminium, in the centre of which is a round hole designed to receive an aluminium cap with a highly polished sapphire centre worked to the form of an open cone. To direct the card eight short light needles, N N, are suspended by silk threads from the outer ring. The magnetic axis of any system of needles must exactly coincide with the axis passing through the north and south points of the card. Single needles are never used, two being the least number, and these so arranged that the moment of inertia about every diameter of the card shall be the same. The combination of card, needles and cap is generally termed "the card"; on the continent of Europe it is called the "rose." The section of a compass bowl in fig. 4 shows the mounting of a Thomson card on its pivot, which in common with the pivots of most other compasses is made of brass, tipped with osmium-iridium, which although very hard can be sharply pointed and does not corrode.

**Fig. 1.**—*Compass Card.*

**Fig. 2.**—Admiralty Compass (Frame and Needles).

**Fig. 3.**—Thomson's (Lord Kelvin's) Compass (Frame and Needles).

**Fig. 4.**—Section of Thomson's Compass Bowl. C, aluminium cap with sapphire centre; N, N', needles; P, pivot stem with pivot.
Fig. 4 shows the general arrangement of mounting all compass cards in the bowl. In fig. 5 another form of compass called a liquid or spirit compass is shown partly in section. The card nearly floats in a bowl filled with distilled water, to which 35% of alcohol is added to prevent freezing; the bowl is hermetically sealed with pure india-rubber, and a corrugated expansion chamber is attached to the bottom to allow for the expansion and contraction of the liquid. The card is a mica disk, either painted as in fig. 1, or covered with linen upon which the degrees and points are printed, the needles being enclosed in brass.

Great steadiness of card under severe shocks and vibrations, combined with a minimum of friction in the cap and pivot, is obtained with this compass. All compasses are fitted with a gimbal ring to keep the bowl and card level under every circumstance of a ship's motion in a seaway, the ring being connected with the binnacle or pedestal by means of journals or knife edges. On the inside of every compass bowl a vertical black line is drawn, called the "lubber's point," and it is imperative that when the compass is placed in the binnacle the line joining the pivot and the lubber's point be parallel to the keel of the vessel. Thus, when a degree on the card is observed opposite the lubber's point, the angle between the direction in which the ship is steering and the north point of the compass or course is at once seen; and if the magnetic variation and the disturbing effects of the ship's iron are known, the desired angle between the ship's course and the geographical meridian can be computed.

In every ship a position is selected for the navigating or standard compass as free from neighbouring iron as possible, and by this compass all courses are shaped and bearings taken. It is also provided with an azimuth circle or mirror and a shadow pin or style placed in the centre of the glass cover, by either of which the variable angle between the compass north and true north, called the "total error," or variation and deviation combined, can be observed. The binnacles or pedestals for compasses are generally constructed of wood about 45 in. high, and fitted to receive and alter at pleasure the several magnet and soft iron correctors. They are also fitted with different forms of suspension in which the compass is mounted to obviate the mechanical disturbance of the card caused by the vibration of the hull in ships driven by powerful engines.

The effects of the iron and steel used in the construction of ships upon the compass occupied the attention of the ablest physicists of the 19th century, with results which enable navigators to conduct their ships with perfect safety. The hull of an iron or steel ship is a magnet, and the distribution of its magnetism depends upon the direction of the ship's head when building, this result being produced by induction from the earth's magnetism, developed and impressed by the hammering of the plates and frames during the process of building. The disturbance of the compass by the magnetism of the hull is generally modified, sometimes favourably, more often unfavourably, by the magnetized fittings of the ship, such as masts, conning towers, deck houses, engines and boilers. Thus in every ship the compass needle is more or less subject to deviation and differing from true north for the azimuth of the ship's head. This was first demonstrated by Commanders of ships, and Matthew Flinders by experiments made in H.M.S. "Investigator" in 1800-1803, and in 1810 led that officer to introduce the practice of placing the ship's head on each point of the compass, and noting the amount of deviation whether to the east or west of the magnetic north, a process which is in full exercise at the present day, and is called "swinging ship." When speaking of the magnetic properties of iron it is usual to adopt the terms "soft" and "hard." Soft iron is iron which becomes instantly magnetized by induction when exposed to any magnetic force, but has no power of retaining its magnetism. Hard iron is less susceptible of being magnetized, but when once magnetized it retains its magnetism permanently. The term "iron" used in these pages includes the "steel" now commonly employed in shipbuilding. If an iron ship be swung when upright for deviation, and the mean horizontal and vertical magnetic forces at the compass positions be also observed in different parts of the world, mathematical analysis shows that the deviations are caused partly by the permanent magnetism of hard iron, partly by the transient induced magnetism of soft iron both horizontal and vertical, and in a lesser degree by iron which is neither magnetically hard nor soft, but which becomes magnetized in the same manner as hard iron, though it gradually loses its magnetism on change of conditions, as, for example, in the case of a ship, repaired and hammered in dock, steaming in an opposite direction at sea. This latter cause of deviation is called sub-permanent magnetism. The horizontal directive force on the needle on board is nearly always less than on land, sometimes much less, whilst in armour-plated ships it ranges from -8 to +2 when the directive force on land = 1.0. If the ship be inclined to starboard or to port additional deviation will be observed, reaching a maximum on north and south points, decreasing to zero on the east and west points. Each ship has its own magnetic character, but there are certain conditions which are common to vessels of the same type.

Instead of observing the deviation solely for the purposes of correcting the indications of the compass when disturbed by the iron of the ship, the practice is to subject all deviations to mathematical analysis with a view to their mechanical correction. The whole of the deviations when the ship is upright may be expressed nearly by five co-efficients, A, B, C, D, E. Of these A is a deviation constant in amount for every direction of the ship's head. It has reference to horizontal forces in the lateral or transverse direction in the ship, and caused partly by the permanent magnetism of hard iron, partly by vertical induction in vertical soft iron either before or abaft the compass. C has reference to forces acting in a transverse direction, and caused by hard iron. D is due to transient induction in horizontal soft iron, the direction of which passes continuously under or over the compass. E is due to transient induction in horizontal soft iron unsymmetrically placed with regard to the compass. When data of this character have been obtained the compass deviations may be mechanically corrected to within 1°—always adhering to the principal that "like cures like." Thus the part of B caused by the permanent magnetism of hard iron must be corrected by permanent magnets horizontally placed in a fore and aft direction; the other part caused by vertical soft iron by means of bars of vertical soft iron, called Flinders bars, before or abaft the compass. C is compensated by permanent magnets athwartships and horizontal; D by masses of soft iron on both sides of the compass, and generally in the form of cast-iron spheres, with their centres in the same horizontal plane as the needles; E is usually too small to require correction; A is fortunately rarely of any value, as it cannot be corrected. The deviation observed when the ship inclines to either side is due—(1) to hard iron acting vertically upwards or downwards; (2) to vertical soft iron immediately below the compass; (3) to vertical induction in horizontal soft iron when inclined. To compensate (1)
vertical magnets are used; (3) partly corrected by the soft iron correctors of Dr. (4) and the remaining part of (3) cannot be corrected by them for more than one geographical position at a time. Although a compass may thus be made practically correct for a given time and place, the magnetism of the ship is liable to changes on changing her geographical position, and especially so when steaming at right angles or nearly so to the magnetic meridian, for then sub-permanent magnetism is developed in the hull. Some vessels are more liable to become sub-permanently magnetized than others, and so no corrector has been found for this source of deviation the navigator must determine its amount by observation. Hence, however carefully a compass may be placed and subsequently compensated, the mariner has no safety without constantly observing the bearings of the sun, stars or distant terrestrial objects, to ascertain its deviation. The results of these observations are entered in a compass journal for future reference when fog or darkness prevails.

Every compass and corrector supplied to the ships of the British navy is previously examined in detail at the Compass Observatory established by the Admiralty at Deptford. A trained observer acting under the superintendent of compasses is charged with this important work. The superintendent, who is a naval officer, has to investigate the magnetic character of the ships, to point out the most suitable positions for the compasses when a ship is designed, and subsequently to keep himself informed of their behaviour from the time of the ship's first trial. A museum containing compasses of various types invented during the 19th century is attached to the Compass Observatory at Deptford.

The mariner's compass during the early part of the 19th century was still a very imperfect instrument, although numerous inventors had tried to improve it. In 1827 the Admiralty appointed Captain Smith to make a scientific investigation of the subject, and propose a form of compass suitable alike for azimuth and steering purposes. The Committee reported in July 1840, and after minor improvements was made, the Compasses Act (48:26) was passed, which is the basis of all law. The compasses are now manufactured under this Act, and are known as a "Flinders bar," is still in general use. In 1828 Dr. T. Young (see Brande's Quarterly Journal, 1820) investigated mathematically the magnetism of ships. In 1824 Professor Peter Barlow (1776-1862) introduced his correcting plate of soft iron. Trials in the Admiralty by Dr. Young showed that this was more effective than hard iron, and the use of the plate was abandoned. In 1835 Captain E. J. Johnson, R.N., showed from experiments in the iron steamer "Garry Owen" that the vessel acted as an external compass as a matter of course. In 1857 S. D. Poisson showed the iron steamer "Rainbow" at Deptford, and from his mathematical investigations (see Phil. Trans., 1859) deduced his method of correcting the compass by permanent magnets and soft iron, giving practical results in the same in 1860. In 1863 the improvement was made from the basis of all law to compass correctors to this day. In 1838 S. D. Poisson published his Memoir on the Deviations of the Compass caused by the Iron in a Vessel. In this he gave equations resulting from the hypothesis that the magnetism of the iron is partly due to the permanent magnetism of hard iron and partly to the passage of a current of magnetic fluid; that the latter is proportional to the intensity of the inducing force, and that the length of the needle is infinitely small in comparison with the distance of the compass from the surrounding iron. From Poisson's equations Archibald Smith derived the formulae for ascertaining and providing for the correction of the heading error with the ship upright, to be of great value to the Admiralty in navigation. In 1855 the Liverpool Compass Committee began to examine the marine compass, and in 1856 the Committee of the Institution of Engineers examined the marine compass, resulting in three reports to the Board of Trade, all of great value, the last being presented in 1861.

History of the Mariner's Compass.

The discovery that a lodestone, or a piece of iron which has been touched by a lodestone, will direct itself to point in a north and south position, and the application of that discovery to direct the navigation of ships, have been attributed to various authors. The Chinese, the Arabs, the Greeks, the Etruscans, the Fins and the Italians have all been claimed as originators of the compass. There is now little doubt that the claim formerly advanced in favour of the Chinese is ill-founded. In Chinese history we are told how, in the sixty-fourth year of the reign of Hwang-ti (264 B.C.), the emperor Huan-yuan, or Hwang-ti, attacked one Tchi-yen, on the plains of Tchou-lou, and finding his army embattled by a thick fog raised by the enemy, constructed a chariot (Tchi-nan) for indicating the south, so as to distinguish the four cardinal points, and was thus enabled to pursue Tchi-yen, and take him prisoner. (Julius Klaproth, Statut du baron Humboldt sur l'invention de la boussole, Paris, 1834.) See also: Mailla, Histoire générale de la Chine, tom. i, p. 316, Paris, 1777.) But, as other versions of the story show, this account is purely mythical. For the south-pointing chariot is clearly that which has been first described in the work of the emperor Han-tsoung (A.D. 866-820); and there is no evidence that they contained any magnet. There is no genuine record of a Chinese marine compass before A.D. 1297, as Klaproth admits. No sea-going ships were built in China before 139 B.C. The earliest allusion to the power of the lodestone in Chinese literature occurs in a Chinese dictionary, finished in A.D. 121, where the lodestone is defined as "a stone with which an attraction can be given to a needle," but this knowledge is no more than that existing in Europe at least five hundred years before. Nor is there any nautical significance in a passage which occurs in the Chinese encyclopaedia, Poii-wen-yun-fou, in which it is stated that under the Tsin dynasty, or between A.D. 265 and 419, "there were ships indicating the south." The Chinese, Sir J. F. Davis informs us, once navigated as far as India, but their most distant voyages at present extend no farther than Java and the Malay Islands to the south (The Chineses, vol. iii, p. 126, London, 1841). According to an Arabic manuscript, a translation of which was published by Eusebius Renaudot (Paris, 1718), they traded in ships to the Persian Gulf.
and Red Sea in the 9th century. Sir G. L. Staunton, in vol. i.
of his Embassy to China (London, 1797), after referring to
the early acquaintance of the Chinese with the property of
the magnet to point southwards, remarks (p. 446), "The nature
and cause of the qualities of the magnet have at all times been
subjects of contemplation among the Chinese. The Chinese
name for the compass is t'ing-nan-ch'ing, or needle pointing
to the south; and a distinguishing mark is fixed on the magnet's
southern pole, as in European compasses upon the northern one."
"The sphere of Chinese navigation," he tells us (p. 447), "is too
limited to have afforded experience and observation for forming
any system of laws supposed to govern the variation of the
needle. . . . The Chinese had soon occasion to perceive how
much more essential the perfection of the compass was to the
superior navigators of Europe than to themselves, as the
commanders of the 'Lion' and 'Hindostan,' trusting to that instru-
ment, stood out directly from the land into the sea." The
number of points of the compass, according to the Chinese,
is twenty-four, which are reckoned from the south pole; the
form also of the instrument they employ is different from that
familiar to Europeans. The needle is peculiarly poised, with its
point of suspension a little below its centre of gravity, and is
exceedingly sensitive; it is seldom more than an inch in
length. It is said "that appearing as a bright spot," writes
Mr. T. S. Davies, "that the different manner of constructing the
needle amongst the Chinese and European navigators shows the
independence of the Chinese of us, as theirs is the worse method,
and had they copied from us, they would have used the better
one" (Thomson's British Annual, 1837, p. 291). On the other
hand, it has been contended that a knowledge of the mariner's
compass was communicated to them directly or indirectly to
the early Arabs, and through the latter was introduced into
Europe. Diodorus has remarked (Literature of Europe, vol. i.)
that it is peculiarly characteristic of all the pretended discoveries
of the middle ages that when the historians mention them for
the first time they treat them as things in general use. Gun-
powder, the compass, the Arabic numerals and paper, are
nowhere spoken of as discoveries, and yet they must have
wrought a total change in war, in navigation, in science, and in
education. G. Tiraboschi (Storia della letteratura italiana,
tom. iv. lib. ii. p. 204, et seq. ed. 2., 1788), in support of the
conjecture that the compass was introduced into Europe by the
Arabs, adduces their superiority in scientific learning and their
early skill in marine affairs, and remarks that the introduction of
the lodestone from a treatise translated by Albertus Magnus,
attributed by the latter to Aristotle, but apparently only an
Arabic compilation from the works of various philosophers. As
the terms Zaron and Aphanton, used there to signify the south
and north poles, are neither Latin nor Greek, Tiraboschi suggests
that they may be of Arabian origin, and that the whole passage
concerning the lodestone may have been added to the original
treatise by the Arabian translators.

Dr. W. Robertson asserts (Historical Disquisition concerning
Ancient India, p. 277) that the Arabs, Turks and Persians have no
original name for the compass, it being called by them Bassola,
the Italian name, which shows that the thing signified is foreign
to them as well as to the word. The Rev. G. P. Badger has,
evertheless, pointed out (Travels of Ludovico di Varheina, trans.
that the name of Busha or Bussa, from the Italian Bassola,
though common among Arab sailors in the Mediterranean, is
very seldom used in the Eastern seas,—Dairah and Bel d'Ibrâh
(the Circle, or House of the Needle) being the ordinary appella-
tives in the Red Sea, whilst in the Persian Gulf Khab-bahnamas
is in more general use. Robertson quotes Sir J. Chardin as boldly
asserting that the Asiatics are beholden to us for this wonderful
instrument, which they had from Europe a long time before the
Portuguese conquests. For, first, their compasses are exactly
like ours, and they buy them of Europeans as much as they can,
scare daring to meddle with their needles themselves. Secondly,
it is certain that the old navigators only coasted it along, which
I impute to their want of this instrument to guide and instruct
them in the middle of the ocean. . . . I have nothing but argu-
ment to offer touching this matter, having never met with any
person in Persia or the Indies to inform me when the compass was
first known among them, though I made inquiry of the most
learned men in both countries. I have sailed from the Indies to
Persia in Indian ships, when no European has been aboard but
myself. The pilots were all Indians, and they used the forestall
and quadrant for their observations. These instruments they
have from us, and made by our artists, and they do not in the
least vary from ours, except that the characters are Arabic. The
Arabs are the most skilful navigators of all the Asiatics or
Africans; but neither they nor the Indians make use of charts,
and they do not much want them; some they have, but they are
copied from ours, for they are altogether ignorant of perspective."
The observations of Chardin, who flourished between 1643 and
1713, cannot be said to receive support from the testimony of
some earlier authorities. That the Arabs must have been ac-
quainted with the compass, and with the construction and use of
charts, at a period nearly two centuries previous to Chardin's
first voyage to the East, may be gathered from the description
given by Barros of a map of all the coast of India, shown to
Vasco da Gama by a Moor of Gusnet (about the 15th of July
1497, in which the bearings were laid down after the manner of
the Moors, or "with meridians and parallels very small (or close
together), without other bearings of the compass; because, as the
squares of these meridians and parallels were very small, the
coast was laid down by these two bearings of N. and S., and E.
and W., with great certainty, without that multiplication of
bearings of the points of the compass usual in our maps, which
serves as the root of the others." Further, we learn from Ossorio
that the Arabs at the time of Gama "were instructed in so many
of the arts of navigation, that they did not yield much to the
Portuguese mariners in the science and practice of maritime
matters." (See The Three Voyages of Vasco da Gama, Hakluyt
Soc., 1899; note to chap. xv. by the Hon. H. E. J. Stanley,
p. 138.) Also the Arabs that navigated the Red Sea at the same
period are shown by Varthema to have used the mariner's chart and
compass (Travels, p. 31).

Again, it appears that compasses of a primitive description,
which can hardly be supposed to have been brought from Europe,
were employed in the East Indies certainly as early as several
years previous to the close of the 16th century. In William
Harlowe's Navigiator's Supply, published in 1597, we read:
"Some have seen a vessel sail out that fell out that I had several
conferences with two East Indians which were brought into England
by master Candish [Thomas Cavendish], and had learned our
language: The one of them was of Mammilla [Manila] in the Isle
of Luzon, the other of Miao in Japan. I questioned with them
concerning their shipping and manner of saying. They described
all things farre different from ours, and showed, that in stead of
our Compass, they use a magnetical needle of six ynyches long,
and longer, upon a pinne in a dish of white China earth filled
with water; In the bottome whereof they have two crosse lines,
for the foure principall winde; the rest of the divisions being
reserved to the skill of their Pilots." Baland Kibijda, also,
An Arabian writer, shows in his Merchant's Treasure, a work given
to the world in 1282, that the magnetized needle, floated on water
by means of a splinter of wood or a reed, was employed on the
Syrian seas at the time of his voyage from Tripoll to Alexandria
(1242), and adds:—"They say that the captains who navigate
the Indian seas use, instead of the needle and splinter, a sort
of fish made out of hollow iron, which, when thrown into the
water, swims upon the surface, and points out the north and
south, which is more certain and sure than the former."
(Küpfer's Reisen, p. 57.) E. F. Wiedemann, in Erlangen Situationsberichte (1804, p. 370), translates
the phrase given above as splinter of wood, by the term wooden
cross. Furthermore, although the sailors in the Indian vessels
in which Nicola de' Conti traversed the Indian seas in 1420 are
stated to have had no compass, still, on board the ship in which
Varthema, less than a century later, sailed from Borneo to Java,
both the mariner's chart and compass were used; it has been
questioned, however, whether in this case the compass was of

Eastern manufacture (Travels of Varthema, Introd. xcv, and p. 239). We have already seen that the Chinese as late as the end of the 15th century made voyages with compasses on which little reliance could be placed; and it may perhaps be assumed that the compasses early used in the East were merely too imperfect to be of much assistance to navigators, and were therefore often dispensed with on customary routes. The Arab traders in the Levant certainly used a floating compass, as did the Italians before the introduction of the pivoted needle; the magnetized piece of iron being floated upon a small raft of cork or reeds in a bowl of water. The Italian name of calamita, which still persists, for the magnet, and which literally signifies a frog, is doubtless derived from this practice.

The simple water-compass is said to have been used by the Corean so late as the middle of the 15th century; and Dr T. Smith, writing in the Philosophical Transactions for 1683–1684, says of the Turks (p. 439), "They have no genius for Sea-voyages, and consequently are very raw and inexperienced in the art of Navigation, scarce venturing to sail out of sight of land. I speak of the natural Turks, who trade either into the black Sea or some part of the Morea, or between Constantinople and Alexandria, and not of the Pyrrites of Barbary, who are for the most part Renegado's, and learnt their skill in Christendom..."

The Turkish compass consists but of 8 points, the four Cardinal and the four Collaterals. That the water-compass was thus, even in the late part of the 15th century, so imperfectly recognized in the East may serve to explain how in earlier times that instrument, long after the first discovery of its properties, may have been generally neglected by navigators.

The Arabic geographer, Edrisi, who lived about 1100, is said by Boucher to give an account, though in a confused manner, of the polarity of the magnet (Hallam, Mid. Ages, vol. iii. chap. 9, part 2); but the earliest definite mention as yet known of the use of the mariner's compass in the middle ages occurs in a treatise entitled Deiensilbus, written by Alexander Neckham in the 12th century. He speaks there of a needle carried on board ship which, being placed on a pivot, and allowed to take its own position of repose, shows mariners their course when the polar star is hidden. In another work, De naturis rerum, lib. ii. c. 80, he writes,—"Mariners at sea, when, through cloudy weather in the day which hides the sun, or through the darkness of the night, they lose the knowledge of the quarter of the world to which they are sailing, touch a needle with the magnet, which will turn round till it sets its motion towards the north."

The magnetic needle, and its suspension on a stick or straw in water, are clearly described in La Bible Gout, a poem probably of the 13th century, by Guiot de Provins, wherein we are told that the magnet (la mancette ou l'amant), an ugly brown stone to which iron turns of its own accord, mariners possess an art that cannot fail them. A needle touched by it, and floated by a stick on water, turns its point towards the pole-star, and a light being placed near the needle on dark nights, the proper course is known (Hist. littéraire de la France, tom. ix. p. 109; Barbazan, Fabliaux, tom. ii. p. 328). Cardinal Jacques de Vitry, bishop of Acon in Palestine, in his History (cap. 30), written about the year 1218, speaks of the magnetic needle as "most necessary for such as sail the sea;" and another French crusader, his contemporary, Vincent de Beauvais, states that the adaman (lodestone) is found in Arabia, and mentions a method of using a needle magnetized by it which is similar to that described by Kibdak. In 1248 Hugo de Bercy notes a change in the construction of compasses, which are now supported on two floats in a glass cup. From quotations given by Antonio Capmany (Questions Criticas) from the De contemplatione of Raimon Lull, of the date 1272, it appears that the latter was well acquainted with the use of

1. Adams in India repertor. Ferrum occulta quadam natura ad ignem surgit. Acus terra postquam adadam etiam continent, ad stellam septentrialem semper conversit, unde validae necessarii est navigatibus in mari.

2. Sicut acus per naturam vertitur ad septentrialem dum sit tacta a magnete.—Sicut acus nautica dirigat marinarium in sapientia navigatione.

Prior to this clear description of a pivoted compass by Peregrinus in 1260, the Italian sailors had used the floating magnet, probably introduced into this region of the Mediterranean by traders belonging to the port of Amalfi, as commemorated in the line of the poet Panormita:

“Primus dedit nautis usum magnetis Almalphis.”

This opinion is supported by the historian Flavius Blondus in his *Italia illustrata*, written about 1450, who adds that its certain origin is unknown. In 1311 Baptista Pio in his *Commentary* repeats the opinion as to the invention of the use of the magnet at Amalfi as related by Flavius. Gyaluus, writing in 1540 (*Libellus de re nautica*), misunderstanding this reference, declared that this observation of the direction of the magnet to the poles had been handed down as discovered by a certain Flavius. From this passa the eight legend, which took shape only in the 17th century, that the compass was invented in the year 1310 by a person to whom was given the fictitious name of Flavio Gioja, of Amalfi.

From the above it will have been evident that, as Barlowe remarks concerning the compass, “the lame tale of one Flavius at Amelplus, in the kingdom of Naples, for to have devised it, is of very slender probability”; and as regards the assertion of Dr Gilbert, of Colchester (*De magnete*, p. 1, 1600), that Marco Polo introduced the compass into Italy from the East in 1260,¹ we need only quote the words of Sir H. Yule (*Book of Marco Polo*):

“Respecting the mariner’s compass and gunpowder, I shall say nothing, as nothing, as no one now, I believe, imagines Marco to have had anything to do with their introduction.”

When, and by whom, the compass card was added is a matter of conjecture. Certainly the *Rosa Ventorum*, or Wind-rose, is far older than the compass itself; and the naming of the eight principal “winds” goes back to the Temple of the Winds in Athens built by Andronicus Cyrrhestes. The earliest known wind-roses on the *portolani* or sailing charts of the Mediterranean period have almost invariably the eight principal points marked with the initials of the principal winds, Tramontano, Greco-Levante, Scirocco, Ostro, África (or Libeccio), Ponente, and Maestro, or with a cross instead of L, to mark the east point. The north point, indicated in some of the oldest compass cards with a broad arrow-head or a spear, as well as with a T for Tramontano, gradually developed by a combination of these, about 1492, into a *fleur de lis*, still universal. The cross at the east continued even in British compasses till about 1700. Wind-roses with these characteristics are found in Venetian and Genoese charts of early 14th century, and are depicted similarly by the Spanish navigators. The naming of the intermediate subdivisions making up the thirty-two points or rhumbs of the compass card is probably due to Flemish navigators; but they were recognized even in the time of Chaucer, who in 1391 wrote, “Now is thin Orisonte departed in xxiiij partes by thyn asynut, in signification of xxiiiij partiz of the world; al be it so that ship men rike thilke partiz in xxiij” (*Treatise on the Astrolabe*, ed. Skeat, Early English Text Soc., London, 1872). The medieval heraldry upon English tops or “files”, so as to turn with it, is probably of Amalphi origin. G. Battuti, the Dante commentator, in 1380 says the sailors use a compass card, the middle of which is pivoted a wheel of light paper to turn on its pivot, on which wheel the needle is fixed and the star (wind-rose) painted. The placing of the card at the bottom of the box, fixed, below the needle, was practised by the compass-makers of Nuremberg in the 16th century, and by Stevinus of Bruges about 1600. The gimbals or rings for suspension hinged at right-angles to one another, have been erroneously attributed to Cardan, the proper term being *cardine*, that is hinged or pivoted. The earliest description of them is about 1604. The term *bimacule*, originally *bitacile*, is a corruption of the Portuguese *ablatiçolo*, to denote the housing enclosing the compass, probably originating with the Portuguese navigators.

The improvement of the compass has been but a slow process. The *Libel of English Policie*, a poem of the first half of the 15th century, says with reference to Iceland (ch. x)—

“Out of Bristowe, and cootes many one, Men haue practysed by needle and by stone Thide wardes within a little while.”

From this it would seem that the compasses used at that time by English mariners were of a very primitive description. Barlowe, in his treatise *Magnetical Advertisements*, printed in 1616 (p. 66), complains that “the Compass needle, being the most admirable and usefull instrument of the whole world, is both amongst ours and other nations for the most part, so hungerly and absurdly contrived, as nothing more.” The form he recommends for the needle is that of “a true circle, having his Axis going out beyond the circle, at each end narrow and narrower, unto a reasonable sparke point, and being pure steel as the circle it selfe is, having in the midst a convenient receptacle to place the capitell in.” In 1750 Dr Gowan Knight found that the needles of merchant-ships were made of two pieces of steel bent in the middle and united in the shape of a rhombus, and proposed to substitute straight steel bars of small diameter, or to replace the steel needle with hard drawn steel throughout. He also showed that the Chinese mode of suspending the needle conduces most to sensibillity. In 1820 Peter Barlow reported to the Admiralty that half the compasses in the British Navy were mere lumber and ought to be destroyed. He introduced a pattern having four or five parallel straight strips of magnetized steel fixed under a card, a form which remained the standard admiralty type until the introduction of the modern Thomson (Kelvin) compass in 1876.

(F. H. B.; S. P. T.)

**COMPASS PLANT**, a native of the North American prairies, which takes its name from the position assumed by the leaves. These turn their edges to north and south, thus avoiding the excessive mid-day heat, while getting the full benefit of the morning and evening rays. The plant is known botanically as *Silphium laciniatum*, and belongs to the natural order Compositae.

Another member of the same order, *Lactua Scarioha*, which has been regarded as the origin of the cultivated lettuce (*L. salata*), behaves in the same way when growing in dry exposed places; it is native of Europe and the northern Asia which has got introduced into North America.

**COMPAyre, JULiS GABRIEL (1843— ), French educationalist, was born at Albi. He entered the École Normale Supérieure in 1862 and became professor of philosophy. In 1876 he was appointed professor in the Faculty of Letters of Toulouse, and upon the creation of the École normale d’inspectrices at Fontenay aux Roses he became teacher of pedagogy (1880). From 1881 to 1889 he was deputy for Lavaur in the chamber, and took an active part in the discussions on public education. Defeated at the elections of 1889, he was appointed rector of the academy of Poitiers in 1890, and five years later to the academy of Lyons. His principal publications are his *Histoire critique des doctrines de l’éducation en France* (1870); *Éléments d’éducation civile* (1881), a work placed on the index at Rome, but very widely read in the primary schools of France; *Cours de pédagogie théorique et pratique* (1885, 13th ed., 1897); *The Intellectual and Moral Development of the Child*, in English (3 vols., New York, 1896-1902); and a series of monographs on *Les Grands Éducateurs*.

**COMPENSATION** (from Lat. *compensare*, to weigh one thing against another), a term applied in English law to a number of different forms of legal reparation; e.g. under the Forfeiture Act 1870 (s. 4), for loss of property caused by felony, or—under the Riot (Damages) Act 1886—to persons whose property has been stolen, destroyed or injured by rioters (see RIOT). It is due, under the Agricultural Holdings Acts 1883-1906, for agricultural improvements (see LANDLORD AND TENANT; cf. also ALLOTMENTS AND SMALL HOLDINGS), and under the Workmen’s Compensation Act 1906 to workmen, in respect of accidents in the course of their employment (see EMPLOYERS’ LIABILITY); and under the Licensing Act 1904, to the payments to be made on the extinction of licences to sell intoxicants. The term

¹ According to all the texts he returned to Venice in 1295 or, as is more probable, in 1296.―Yule.
"Compensation water" is used to describe the water given from a reservoir in compensation for water abstracted from a stream, under statutory powers, in connexion with public works (see WATER SUPPLY). As to the use of the word "compensation" in horology, see CLOCK; WATCH.

Compensation, in its most familiar sense, is however a nomen juris for the reparation or satisfaction made to the owners of property which is taken by the state or by local authorities or by the promoters of parliamentary undertakings, under statutory authority, for public purposes. There are two main legal theories on which such appropriation of private property is justified. The American may be taken as a representative illustration of the one, and the English of the other. Though not included in the definition of "eminent domain," the necessity for compensation is recognized as incidential to that power. (See EMINENT DOMAIN, under which the American law of compensation, and the closely allied doctrine of expropriation pour cause d'utilité publique of French law, and the law of other continental countries, are discussed.) The rule of English constitutional law, on the other hand, is that the property of the citizen cannot be seized for purposes which are really "public" without a fair pecuniary equivalent being given to him; and, as the money for such compensation comes from parliament, the practical result is that the seizure can only be effected by legislative authority. An action for illegal interference with the property of the subject is not maintainable against officials of the crown or government sued in their official capacity or as an official body. But crown officials may be sued in their individual capacity for such interference, even if they acted with the authority of the government (cp. Raleigh v. Goschen [1868], 1 Ch. 73).

Law of England.—Down to 1845 every act authorizing the purchase of lands had, in addition to a number of common form clauses, a variety of special clauses framed with a view to meeting the particular circumstances with which it dealt. In 1845, however, a statute based on the recommendations of a select committee, appointed in the preceding year, was passed; the object being to diminish the bulk of the special acts, and to introduce uniformity into private bill legislation by classifying the common form clauses, embodying them in general statutes, and facilitating their incorporation into the special statutes by reference to them. Though not entirely successful in these respects, the Lands Clauses Consolidation Act 1845; and the policy has been continued by a series of later statutes which, together with the act of 1845, are now grouped under the generic title of the Lands Clauses Acts.

The public purposes for which lands are taken are threefold. Certain public departments, such as the war office and the admiralty, may acquire lands for national purposes (see the Defence Acts 1842 to 1873; and the Lands Clauses Consolidation Act 1860, s. 7). Local authorities are enabled to exercise similar powers for an enormous variety of municipal purposes, e.g. the housing of the working classes, the improvement of towns, and elementary and secondary education. Lastly, the promoters of public undertakings of a commercial character, such as railways and harbours, carry on their operations under statutes in which the provisions of the Lands Clauses Acts are incorporated.

Lands may be taken under the Lands Clauses Acts either by agreement or compulsorily. The first step in the proceedings is a "notice to treat," or intimation, by the promoters, of their readiness to purchase the land, coupled with a demand for particulars as to the estate and the interests in it. The landowner on whom the notice is served may meet it by agreeing to sell, and the terms may then be settled by consent of the parties themselves, or by arbitration, if they decide to have recourse to that mode of adjusting the difficulty. If the property claimed is a house, or other building or manufacture, the owner has a statutory right to require the promoters by a counter-notice to take the whole, even although a part would serve their purpose. This rule, however, is, in modern acts, often modified by special clauses. On receipt of the counter-notice the promoters must either assent to the requirement contained in it, or abandon their notice to treat. On the other hand, if the landowner fails within twenty-one days after receipt of the notice to treat to give the particulars which it requires, the promoters may proceed to exercise their compulsory powers and to obtain assessment of the compensation to be paid. As a general rule, it is a condition precedent to the exercise of these powers by a company that the capital of the undertaking should be fully subscribed.

Compensation, under the Lands Clauses Acts, is assessed in four different modes:—(1) by justices, where the claim does not exceed £50, or a claimant who has no greater interest than that of a tenant for a year, or from year to year, is required to give up possession before the expiration of his tenancy; (2) by arbitration, where the claim exceeds £50, and the claimant desires arbitration, and the interest is not a yearly tenancy, (b) when the amount has been ascertained by a surveyor, and the claimant is dissatisfied, (c) when superfluous lands are to be sold, and the parties entitled to pre-emption and the promoters cannot agree as to the price. (Lands become "superfluous" if taken compulsorily on an erroneous estimate of the area needed, or if part only was needed and the owner compelled the promoters under the power above mentioned to take the whole, or in cases of abandonment; (3) by jury, when the claim exceeds £50, and (4) where there is no dispute of arithmetic or arbitration. Award has been made within the prescribed time, or (b) the claimant applies in writing for trial by jury; (4) by surveyors, nominated by justices, where the owner is under disability, or does not appear at the appointed time, or the claim is in respect of movable rights, and a committee has not been appointed to treat with the promoters.

Promoters are not allowed without the consent of the owner to enter upon lands which are subject of proceedings under the Lands Clauses Acts, except for the purpose of making a survey, unless they have executed a statutory bond and made a deposit, at the Law Courts Branch of the Bank of England, as security for the performance of the conditions of the bond.

Measure of Value.—(1) Where land is taken, the basis on which compensation is assessed is the commercial value of the land to the owner at the date of the notice to treat. Potential value may be taken into account, and also good-will of the property in a business. This rule, however, excludes any consideration of the character of "betterment." (2) Where land, or any part of it, is taken, "injurious affected" by the works of the promoters, compensation is payable for loss or damage resulting from any act, legalized by the promoters' statutory powers, which would otherwise have been actionable, or caused by the execution (not the use) of the works authorized by the undertaking.

The following examples of how land may be "injurious affected," so as to give a right to compensation under the acts, may be given:—narrowing or obstructing a highway which is the nearest access to the lands in question; interference with a right of way; substantial interference with ancient lights; noise of children outside a board school.

Scotland and Ireland.—The Lands Clauses Act 1845 extends to Ireland. There is a Scots enactment similar in character (Lands Clauses [Scotland] Act 1845). The principles and practice of the law of compensation are substantially the same throughout the United Kingdom.

India and the British Colonies.—Legislation analogous to the Lands Clauses Acts is in force in India (Land Acquisition Act 1894 [Act i of 1894]) and in most of the colonies (see western Australia, Lands Resumption Act 1894 [58 Vict. No. 33], Victoria, Lands Compensation Act 1890 [54 Vict. No. 1104]; New Zealand, Public Works Act 1894 [58 Vict. No. 42]; Ontario [Revised Stats. 1897, c. 37].)

(A.W.R.)
COMPIÈGNE—COMPOSITAE

COMPIÈGNE, a town of northern France, capital of an arrondissement in the department of Oise, 52 m. N.N.E. of Paris on the main railway between Paris and St Quentin. Pop. (1906) 14,052. The town, which is a favourite summer resort, stands on the north-west border of the forest of Compiègne and on the left bank of the Oise, less than 1 m. below its confluence with the Aisne. The river is crossed by a bridge built in the reign of Louis XV. The Rue Solferino, a continuation of the bridge ending at the Place de l'Hôtel de Ville, is the busy street of the town; elsewhere, except on market days, the streets are quiet. The hôtel de ville, with a graceful façade surmounted by a lofty belfry, is in the late Gothic style of the early 16th century and was completed in modern times. Of the churches, St Antoine (13th and 16th centuries) with some fine Renaissance stained glass, and St Jacques (13th and 15th centuries), need alone be mentioned. The remains of the ancient abbey of St Corenille are used as a military storehouse. Compiègne, from a very early period until 1870, was the occasional residence of the French kings. Its palace, one of the most magnificent structures of its kind, was erected, chiefly by Louis XV. and Louis XVI., on the site of a château of King Charles V. of France. It now serves as an art museum. It has two façades, one overlooking the Place du Palais and the town, the other, more imposing, facing towards a fine park and the forest, which is chiefly of oak and beech and covers over 36,000 acres. Compiègne is the seat of a subprefecture, and has tribunals of first instance and of commerce, a communal college, library and hospital. The industries comprise boat-building, rope-making, steam-sawing, distilling and the manufacture of chocolate, machinery and sacks and coarse coverings, and at Margny, a suburb, there are manufactures of chemicals and felt hats. Asparagus is cultivated in the environs. There is a considerable trade in timber and coal, chiefly river-borne.

Compiègne, or as it is called in the Latin chronicles, Compendium, seems originally to have been a hunting-lodge of the early Frankish kings. It was enriched by Charles the Bald with two castles, and a Benedictine abbey dedicated to Saint Corenille, the monks of which retained down to the 18th century the privilege of acting for three days as lords of Compiègne, with full power to release prisoners, condemn the guilty, and even inflict sentence of death. It was in Compiègne that King Louis I. the Debonair was deposed in 833; and at the siege of the town in 1430 Joan of Arc was taken prisoner by the English. A monument to her faces the hôtel de ville. In 1624 the town gave its name to a treaty of alliance concluded by Richelieu with the Dutch; and it was in the palace that Louis XIV. gave, to Madame de Maintenon, that Napoleon I. received Marie Louise of Austria, that Louis XVIII. entertained the emperor Alexander of Russia, and that Leopold I., king of the Belgians, was married to the princess Louise. In 1814 Compiègne offered a stubborn resistance to the Prussian troops. Under Napoleon III. it was the annual resort of the court during the hunting season. From 1870 to 1871 it was one of the headquarters of the German army.

COMPLEMENT (Lat. complementum, from complerre, to fill up), that which fills up or completes anything, e.g. the number of men necessary to man a ship. In geometry, the complement of an angle is the difference between the angle and a right angle; the complements of a parallelogram are formed by drawing parallel to adjacent sides of a parallelogram two lines intersecting on a diagonal; four parallelograms are thus formed, and the two not about the diagonal of the original parallelogram are the complements of the parallelogram. In analysis, a complementary function is a partial solution to a differential equation (q.v.); complementary operators are reciprocal or inverse operators, i.e. two operations A and B are complementary when both operating on the same figure or function leave it unchanged. A "complementary colour" is one which produces white when mixed with another (see Colours). In Spanish the word complemento was used in a particular sense of the fulfilment of the duties of polite behaviour and courtesy, and it came through the French and Italian forms into use in English, with a change in spelling to "compliment," with the sense of an act of politeness, especially of a polite expression of praise, or of social regard and greetings. The word "comply," meaning to act in accordance with wishes, orders or conditions, is also derived from the same origin, but in sense is connected with "ply" or "plant," from Lat. plicare, to bend, with the idea of suberviently yielding to the wishes of another.

COMPLUVIUM (from Lat. compluere, to flow together, i.e. in reference to the rain being collected and falling through), in architecture, the Latin term for the open space left in the roof of the atrium of a Roman house for lighting it and the rooms round (see CAVAEDUM).

COMPOSITAE, the name given to the largest natural order of flowering plants, containing about one-tenth of the whole number and characterized by the crowding of the flowers into heads. The order is cosmopolitan, and the plants show considerable variety in habit. The great majority, including most British representatives, are herbaceous, but in the warmer parts of the world shrubs and arborecent forms also occur; the latter are characteristic of the flora of oceanic islands. In herbaceous plants the leaves are often arranged in a rosette on a much shortened stem, as in dandelion, daisy and others; when the stem is elongated the leaves are generally alternate. The root is generally thickened, sometimes, as in dahlia, tuberous; root and stem contain oil passages, or, as in lettuce and dandelion, a milky white latex. The flowers are crowded in heads (capitula) which are surrounded by an involucre of green bracts,—these

1. Flower head of Marigold.
2. Same in vertical section.
3. Head of fruits, nat. size.
4. A single fruit.

1. A part of flowers in the bud stage, performing the usual function of a calyx. The enlarged top of the axis, the receptacle, is flat, convex or conical, and the flowers open in centripetal succession. In many cases, as in the sunflower or daisy, the outer or ray-florets are larger and more conspicuous than the inner, or disk-florets; in other cases, as in dandelion, the florets are all alike. Ray-florets when present are usually pistillate, but neuter in some genera (as Centaurea); the disk-florets are hermaproditic. The flower is epigynous; the calyx is sometimes absent, or is represented by a rim on the top of the ovary, or takes the form of hairs or bristles which enlarge in the fruiting stage to form the pappus by means of which the seed is dispersed. The corolla, of five united petals, is regular and tubular in shape as in the disk-florets, or irregular when it is either strap-shaped (ligulate), as in the ray-florets of daisy, &c., or all the florets of dandelion, or more rarely two-lipped. The five stamens are attached to the interior of the corolla-tube; the filaments are free; the anthers are joined (syngenesous) to form a tube round the single style, which ends in a pair of stigmas. The inferior ovary contains one ovule (attached to the base of the chamber), and ripens to form a dry one-seeded fruit; the seed is filled with the straight embryo.

The flower-heads are an admirable example of an adaptation for pollination by aid of insects. The crowding of the flowers in heads ensures the pollination of a large number as the result of a single insect visit. Honey is secreted at the base of the style, and is protected from rain or dew and the visits of short-tipped insects by the corolla-tube, the length of which is
COMPOSITE ORDER—COMPOSITION

correlated with the length of prebscus of the visiting insect. When the flower opens, the two stigmas are pressed together below the tube formed by the anthers, the latter split on the inside, and the pollen fills the tube; the style gradually lengthens and carries the pollen out of the anther tube, and finally the stigmas spread and expose their receptive surface which has hitherto been hidden, the two being pressed together. Thus the life history of the flower falls into two stages, one earlier or male and a later or female. This favours cross-pollination as compared with self-pollination. In many cases there is a third stage, as in dandelion, where the stigmas finally curl back so that they touch any pollen grains which have been left on the style, thus ensuring self-pollination if cross-pollination has not been effected.

The devices for distribution of the fruit are very varied. Frequently there is a hairy or silky pappus forming a tuft of hairs, as in thistle or coltsfoot, or a parachute-like structure as in dandelion; these render the fruit sufficiently light to be carried by the wind. In Bidens the pappus consists of two or more still-barbed bristles which cause the fruit to cling to the coats of animals. Occasionally, as in sunflower or daisy, the fruits bear no special appendage and remain on the head until jerked off.

Compositae are generally considered to represent the most highly developed order of flowering plants. By the massing of the flowers in heads great economy is effected in the material required for one flower, as conspicuousness is ensured by the association; economy of time on the part of the pollinating insect is also effected, as a large number of flowers are visited at one time. The floral mechanism is both simple and effective, favouring cross-pollination, but ensuring self-pollination should that fail. The means of seed-distribution are also very effective.

A few members of the order are of economic value, e.g., Lactuca (lettuce; q.v.), Cichorium (chicory; q.v.), Cynara (artichoke and cardoon; q.v.), Helianthus (Jerusalem artichoke). Many are cultivated as garden or greenhouse plants, such as Solidago (golden rod), Aster (daisy; q.v.), Achillea (yarrow), Chrysanthemum, Pyrethrum (feverfew; now generally included under Chrysanthemum), Tansacum (insect), Arnica, Doronicum, Cineraria, Calendula (common marigold) (fig. 1), Echinops (globe thistle), Centaurea (cornflower) (fig. 2). Some are of medicinal value, such as Anthemis (chamomile), Artemisia (wormwood), Tussilago (coltsfoot), Arnica.

Insect powder is prepared from species of Pyrethrum.

The order is divided into two suborders—Tubuliflorae, characterized by absence of latex, and the florets of the disk being not ligulate, and Liguiflorae, characterized by presence of latex and all the florets being ligulate. The first suborder contains the majority of the genera, and is divided into a number of tribes, characterized by the form of the anthers and styles, the presence or absence of scales on the receptacle, and the similarity or otherwise of the florets of one and the same head. The order is well represented in Britain, in which forty-two genera are native. These include some of the commonest weeds, such as dandelion (Taraxacum officinale), astragalus (Bellis perennis), groundsel (Senecio vulgaris) and ragwort (S. Jacobaea); coltsfoot (Tussilago Farfara) is one of the earliest plants to flower, and other genera are Chrysanthemum (ox-eye daisy and corn-marigold), Achillea (yarrow), Cichorium (knawpweed and cornflower), Cacoxenon and Cnicus (thistles), Hieracium (hawkweed), Sonchus (sow-thistle), Achillea (yarrow, or milfoil, and sneezewort), Eupatorium (hemp-agrimony), Gnorinite (cudweed), Erigeron (fleabane), Solidago (golden rod), Anthemis (mayweed and chamomile), Cichorium (chicory), Lapsana (nicewort), Crepis (haw's-beard), Hypochaeris (cat's-ear), and Targopogon (goat's-beard).

COMPOSITE ORDER, in architecture, a compound of the Ionic and Corinthian orders (see ORDER), the chief characteristic of which is found in the capital (q.v.), where a double row of acanthus leaves, similar to those carved round the Corinthian capital, has been added under the Ionic volutes. The richer decoration of the Ionic capital had already been employed in those of the Erechtheum, where the necking was carved with the palmette or honeysuckle. Similar decorated Ionic capitals were found in the forum of Trajan. The earliest example of the Composite capital is found in the arch of Titus at Rome. The entablature was borrowed from that of the Corinthian order.

COMPOSITION (Lat. compositio, from componere, to put together), the action of putting together and the product of such action. There are many applications of the word. In philology it is used of the putting together of two distinct words to form a single word; and in grammar, of the combination of words into sentences, and sentences into periods, and then applied to the result of such combination, and to the art of producing a work in prose or verse, or to the work itself. In music "composition" is used both of the art of combining musical sounds in accordance with the rules of musical form, and, more generally, of the whole art of creation or invention. The term "composer" is thus particularly applied to the musical creator in general. In the other fine arts the word is
more strictly used of the balanced arrangement of the parts of a picture, of a piece of sculpture or a building, so that they should form one harmonious whole. The word also means an agreement or an adjustment of differences between two or more parties, and is thus the best general term to describe the agreement, often called by the equivalent German word "Ausgleich," between Austria and Hungary in 1867. A more particular use of the word is the legal one, for an agreement by which a creditor agrees to take from his debtor a sum less than his debt in satisfaction of the whole (see Bankruptcy). In logic "composition" is the name given to a fallacy of equivocation, where what is true distributively of each member of a class is inferred to be true of the whole class collectively. The fallacy of "division" is the converse of this, where what is true of a term used collectively is inferred to be true of its several parts. A common source of these errors in reasoning is the confusion between the collective and distributive meanings of the word "all." Composition, often shortened to "comp," is the name given to many materials compounded of more than one substance, and is used in various trades and manufactures, as in building, for a mixture, such as stucco, cement and plaster; for building walls, &c., often made to represent stone or marble; a similar moulded compound is employed to represent carved wood.

**COMPOUND** (from Lat. *componere*, to combine or put together), a combination of various elements, substances or ingredients, so as to form one composite whole. A "chemical compound" is a substance which can be resolved into simple constituents, as opposed to an element which cannot be so resolved (see Chemistry); a word is said to be a "compound" when it is made up of different words or parts of different words. The term is also used in an adjectival form with many applications; a "compound engine" is one where the expansion of the steam is effected in two or more stages (see Steam-engine); in zoology, the "compound eye" possessed by insects and crustacea is one which is made up of several eyes, each surrounded by a frame, set together so that the whole has the appearance of being faceted (see Eye); in botany, the "compound leaf" has two or more separate blades on a common leaf-stalk; in surgery, a "compound fracture" the skin is broken as well as the bone, and there is a communication between the two. There are many mathematical and arithmetical uses of the term, particularly of those forms of addition, multiplication, division and subtraction which deal with quantities of more than one denomination. Compound interest is paid upon interest, the accumulation of interest, as it were, a secondary principal. The verb "to compound" is used of the arrangement or settlement of differences, and especially of an agreement made to accept or to pay part of a debt in full discharge of the whole, and thus of the arrangement made by an insolvent debtor with his creditors (see Bankruptcy); similarly of the substitution of one payment for annual or other periodic payments,—thus subscriptions, university or other dues, &c., may be "compounded"; a particular instance of this is the system of "compounding" for rates, where the occupier of premises pays an increased rent, and the owner makes himself responsible for the payment of the rate. The householders who thus compounding with the owner of the premises he occupies is known as a "compound householder."

The payment of poor rate forming part of the qualification necessary for the parliamentary franchise in the United Kingdom, various statutes, leading up to the Compound Householders Act 1851, have enabled such occupiers to claim to be placed on the rate. In law, to compound a felony is to agree with the felon not to prosecute him for his crime, in return for valuable consideration, or, in the case of a theft, on return of the goods stolen. Such an agreement is a misdemeanour and is punishable with fine and imprisonment.

The name "compounder" was given during the reign of William III. of England to the members of a Jacobite faction, who were prepared to restore James II. to the throne, on the condition of an amnesty and an undertaking to preserve the constitution. Until 1853, in the university of Oxford, those possessing private incomes of a certain amount paid special dues for their degrees, and were known as Grand and Petty Compounders.

The corruption "compound" (from the Malay *kampung* or *kampois*, a quarter of a village) is the name applied to the enclosed ground, whether garden or waste, which surrounds an Anglo-Indian house. In India the European quarter, as a rule, is separate from the native quarter, and consists of a number of single houses, each standing in a compound, sometimes many acres in extent.

**COMPOUND PIER**, the architectural term given to a clustered column or pier which consists of a centre mass or newel, to which engaged or semi-detached shafts have been attached, in order to perform, or to suggest the performance of, certain definite structural objects, such as to carry arches of additional orders, or to support the transverse or diagonal ribs of a vault, or the tie beam of an important roof. In these cases, though performing different functions, the drums of the pier are often cut out of one stone. There are, however, cases where the shafts are detached from the pier and coupled to it by armatures at regular heights, as in the Early English period.

**COMPRA** (a Portuguese word used in the East, derived from the Lat. *comparare*, to procure), originally a native servant in European households in the East, but now the name given to the native managers in European business houses in China, and also to native contractors supplying ships in the Philippines and elsewhere in the East.

**Compression**, in astronony, the deviation of a heavenly body from the spherical form, called also the "ellipticity." It is numerically expressed by the ratio of the differences of the axes to the major axis of the spheroid. The compression or "flattening" of the earth is about 1/298, which means that the ratio of the equatorial to the polar axis is 298:297 (see Earth, Figure of the). In engineering the term is applied to the arrangement by which the exhaust valve of a steam-engine is made to close, shutting a portion of the exhaust steam in the cylinder, before the stroke of the piston is quite complete. This steam being compressed as the stroke is completed, a cushion is formed against which the piston does work while its velocity is being rapidly reduced, and thus the stresses in the mechanism due to the inertia of the reciprocating parts are lessened. This compression, moreover, obviates the shock which would otherwise be caused by the admission of the fresh steam for the return stroke. In internal combustion engines it is a necessary condition of economy to compress the explosive mixture before it is ignited: in the Otto cycle, for instance, the second stroke of the piston effects the compression of the charge which has been drawn into the cylinder by the first forward stroke.

**Compromise** (pronounced *compromise*; through Fr. from Lat. *compromissum*), a term, meaning strictly a joint agreement, which has come to signify such a settlement as involves a mutual adjustment, with a surrender of part of each party's claim. From the element of danger involved has arisen an invidious sense of the word, imputing discredit, so that being "compromised" a person is held to be injured in reputation.

**COMPROMISE MEASURES OF 1850**, in American history, a series of measures the object of which was the settlement of five questions in dispute between the pro-slavery and anti-slavery factions in the United States. Three of these questions grew out of the annexation of Texas and the acquisition of western territory as a result of the Mexican War. The settlers who had flocked to California after the discovery of gold in 1848 adopted an anti-slavery state constitution on the 13th of October 1849, and applied for admission into the Union. In the second place it was necessary to form a territorial government for the remainder of the territory acquired from Mexico, including that now occupied by Nevada and Utah, and parts of Wyoming, Colorado, Arizona and New Mexico. The fundamental issue was in regard to the admission of slavery into, or the exclusion of slavery from, this region. Thirdly, there was a dispute over the western boundary of Texas. Should the Rio Grande be the line of division north of Mexico, or should an arbitrary boundary be established farther to the eastward? In other words, should a considerable part of
the new territory be certainly opened to slavery as a part of Texas, or possibly closed to it as a part of the organized territorial section. Underlying all of these issues was of course the great moral and political problem as to whether slavery was to be confined to the south-eastern section of the country or be permitted to spread to the Pacific. The two questions not growing out of the Mexican War were in regard to the abolition of the slave trade in the District of Columbia, and the passage of a new fugitive slave law.

Congress met on the 3rd of December 1840. Neither faction was strong enough in both houses to carry out its own programme, and it seemed for a time that nothing would be done. On the 29th of January 1849 Henry Clay presented the famous resolution which constituted the basis of the ultimate compromise. His idea was to combine the more conservative elements of both sections in favour of a settlement which would concede the Southern view on two questions, the Northern view on two, and balance the fifth. Daniel Webster supported the plan in his great speech of the 7th of March, although in doing so he alienated many of his former opponents. Opposed to the conservatives were the extremists of the North, led by William H. Seward and Salmon P. Chase; and those of the South, led by Jefferson Davis. Most of the measures were rejected and the whole plan seemed likely to fail, when the situation was changed by the death of President Taylor and the accession of Millard Fillmore on the 9th of July 1850. The influence of the administration was now thrown in favour of the compromise. Under a tacit understanding of the moderates to vote together, five separate bills were passed, and were signed by the president between 9th and 20th September 1850. California was admitted as a free state, and the slave trade was abolished in the District of Columbia; these were concessions to the North. New Mexico (then including the present Arizona) and Utah were organized without any prohibition of slavery (each being left free to decide for or against, on admission to statehood), and a rigid fugitive slave law was enacted; these were concessions to the South. Texas (as) was compellable to give up much of the western land to which it had a good claim, and received in return $10,000,000. This legislation had several important results. It helped to postpone secession and Civil War for a decade, during which time the North-West was growing more wealthy and more populous, and was being brought into closer relations with the North-East. It divided the Whigs into “Cotton Whigs” and “Conscience Whigs,” and in time led to the downfall of the party. In the third place, the rejection of the Wilmot Proviso and the acceptance (as regards New Mexico and Utah) of “Squatter Sovereignty” meant the adoption of a new principle in dealing with slavery in the territories, which, although it did not apply to the same territory, was antagonistic to the Missouri Compromise of 1820. The sequel was the repeal of the Missouri Compromise in the Kansas-Nebraska Bill of 1854. Fourthly, the enforcement of the fugitive slave law aroused a feeling of bitterness in the North which helped eventually to bring on the war, and helped to make it, when it came, quite as much an anti-slavery crusade as a struggle for the preservation of the Union. Finally, although Clay for his support of the compromises and Seward and Chase for the treaty, were again esteemed in reputation, Webster has been selected as the special target for hostile criticism. The Compromise Measures are sometimes spoken of collectively as the Omnibus Bill, owing to their having been grouped originally—when first reported (May 8) to the Senate—into one bill.

The best account of the above Compromises is to be found in J. F. Rhodes, History of the United States from the Compromise of 1850, vol. i. (New York, 1860. [W. R. S.]*.)

COMPSA (mod. Coma), an ancient city of the Hirpini, near the sources of the Aufidus, on the boundary of Lucania and not far from that of Apulia, on a ridge 909 ft. above sea-level. It was betrayed to Hannibal in 216 B.C. after the defeat of Cannae, but recaptured two years later. It was probably occupied by Sulla in 89 B.C., and was the scene of the death of T. Annius Milo in 48 B.C. Most authorities (cf. Hülsen in Pauly-Wissowa, Realencyclopädie, Stuttgart, 1901, iv. 797) refer Caes. Bell. cit. iii. 22, and Plin.Hist. Nat. ii. 147, to this place, supposing the MSS. to be corrupt. The usual identification of the site of Milo’s death with Cassano on the Gulf of Taranto must therefore be rejected. In imperial times, as inscriptions show, it was a municipium, but it lay far from any of the main high-roads. There are no important ancient remains.

COMPTON, HENRY (1632–1713), English divine, was the sixth and youngest son of the second earl of Northampton. He was educated at Queen’s Collage, Oxford, and then travelled in Europe. After the restoration of Charles II. he became cornet in a regiment of horse, but soon quitted the army for the church. After a further period of study at Cambridge and again at Oxford, he held various livings. He was made bishop of Oxford in 1674, and in the following year was translated to the see of London. He was also appointed a member of the Privy Council, and entrusted with the education of the two princesses—Mary and Anne. He showed a liberality most unusual at the time to Protestant dissenters, whom he wished to reunite with the established church. He held several conferences on the subject with the clergy of his diocese; and in the hope of influencing many of the opinions of unbiased foreigners, he obtained letters treating of the question (since printed at the end of Stillingsfleet’s Unreasonableness of Separation) from Le Moyne, professor of divinity at Leiden, and the famous French Protestant divine, Jean Claude. But to Roman Catholicism he was strongly opposed. On the accession of James II. he consequently lost his seat in the council and his deanery in the Chapel Royal; and for his firmness in refusing to suspend John Sharp, rector of St. Giles’s-in-the-Fields, whose anti-papal writings had rendered him obnoxious to the king, he was himself suspended. At the Revolution Compton embraced the cause of William and Mary; he performed the ceremony of their coronation; his old position was restored to him; and among other appointments, he was chosen as one of the commissioners for revising the liturgy. During the reign of Anne he remained a member of the privy council, and was one of the commissioners appointed to arrange the terms of the union of England and Scotland; but, to his bitter disappointment, his claims to the primacy were twice passed over. He died at Fulham on the 7th of July 1713. He had conspicuous defects both in spirit and intellect, but was benevolent and philanthropic. He was a successful botanist. He published, besides several theological works, A Translation from the Italian of the Life of Donna Olympia Maladichini, who governed the Church during the time of Pope Innocent X., which was from the year 1644 to 1655 (1667), A Translation from the French of the Jesuits’ Intrigues (1668).

COMPTROLLER, the title of an official whose business primarily was to examine and take charge of accounts, hence to direct or control, e.g. the English comptroller of the household, comptroller and auditor-general (head of the exchequer and audit department), comptroller-general of patents, &c., comptroller-general (head of the national debt office). On the other hand, the word is frequently spelt controller, as in controller of the navy, controller or head of the stationery office. The word is used in the same sense in the United States, as comptroller of the treasury, an official who examines accounts and signs drafts, and comptroller of the currency, who administers the law relating to the national banks.

COMPUGRATION (from Lat. computare, to purify: completely), a mode of procedure formerly employed in ecclesiastical courts, and derived from the canon law (compurgatio canonica), by which a clerk who was accused of crime was required to make answers on the oath of himself and a certain number of other clerks (compurgators) who would swear to his character or innocence. The term is more especially applied to a somewhat similar procedure, the old Teutonic or Anglo-Saxon mode of trial by oath-taking or oath-helping (see Jury).

COMTE, AUGUSTE [ISIDORE AUGUSTE MARIE FRANÇOIS XAVIER] (1798-1857), French positive philosopher, was born on the 10th of January 1798 at Montpellier, where his father was a receiver-general of taxes for the district. He was sent for his earliest instruction to the school of the town, and in 1814
was admitted to the École Polytechnique. His youth was marked by a constant willingness to rebel against merely official authority; to genuine excellence, whether moral or intellectual, he was always ready to pay unboundede deference. That strenuous application which was one of his most remarkable gifts in manhood showed itself in his youth, and his application was backed or inspired by superior intelligence and aptness. After he had been two years at the École Polytechnique he took a foremost part in a mutinous demonstration against one of the masters; the school was broken up, and Comte like the other scholars was sent home. To the great dissatisfaction of his parents, he resolved to return to Paris (1816), and to earn his living there by giving lessons in mathematics. Benjamin Franklin was the youth’s idol at this moment. “I seek to imitate the modern Socrates,” he wrote to a school friend, “not in talents, but in way of living. You know that at five-and-twenty he formed the design of becoming perfectly wise and that he fulfilled his design. I have the same design for the same thing, though I am not yet twenty.” Though Comte’s character and aims were as far removed as possible from Franklin’s type, neither Franklin nor any man that ever lived could surpass him in the heroic tenacity with which, in the face of a thousand obstacles, he pursued his own ideal of a vocation.

For a moment circumstances led him to think of seeking a career in America, but a friend who preceded him thither warned him of the purely practical spirit that prevailed in the new country. “If Lagrange were to come to the United States, he could only earn his livelihood by turning land surveyor.” So Comte remained in Paris, living as he best could on something less than £80 a year, and hoping, when he took the trouble to break his meditations upon greater things, that he might by and by obtain an appointment as mathematical master in a school. A friend procured him a situation as tutor in the house of Casimir Périer. The salary was good, but the duties were penurious. The young man was totally inexperienced, and that was worse; there were an end of the delicious liberty of the garret. After a short experience of three weeks Comte returned to neediness and contentment. He was not altogether without the young man’s appetite for pleasure; yet when he was only nineteen we find him wondering, amid the gaieties of the carnival of 1817, how a gavotte or a minuet could make people forget that thirty thousand human beings around them had barely a morsel to eat.

Towards 1818 Comte became associated as friend and disciple with Saint-Simon, who was destined to exercise a very decisive influence upon the turn of his speculation. In after years he so far forgot himself as to write of Saint-Simon as a depraved quack, and to deplore his connexion with him as purely mischievous. While the connexion lasted he thought very differently. Saint-Simon is described as the most estimable and lovable of men, and the most delightful in his relations; he is the worthiest of philosophers. Even at the very time he went to Saint-Simon’s a remembrance would have been no comfort to the young man. Comte gratulating himself on having thrown off the yoke, he honestly admits that Saint-Simon’s influence has been of powerful service in his philosophic education. “I certainly,” he writes to his most intimate friend, “am under great personal obligations to Saint-Simon; that is to say, he helped in a powerful degree to launch me in the philosophical direction that I have now definitely marked out for myself, and that I shall follow without looking back for the rest of my life.” Even if there were no such unmistakable expressions as these, the most cursory glance into Saint-Simon’s writings is enough to reveal the thread of connexion between the ingenious visionary and the systematic thinker. We see the debt, and we also see that when it is stated at the highest possible, nothing has really been taken either from Comte’s claims as a powerful original thinker, or from his immeasurable preeminence over Saint-Simon in intellectual grasp and vigour and coherence. As high a degree of originality may be shown in transformation as in invention, as Mollière and Shakespeare have proved in the region of dramatic art. In philosophy the conditions are not different. Il faut prendre son bien où on le trouve.

It is no detriment to Comte’s fame that some of the ideas which he recombined and incorporated in a great philosophic structure had their origin in ideas that were produced almost at random in the incessant fermentation of Saint-Simon’s brain. Comte is in no true sense a follower of Saint-Simon, but it was undoubtedly Saint-Simon who launched him, to take Comte’s own word, by suggesting the two starting-points of what grew into the Comtist system—first, that political phenomena are as capable of being grouped under laws as other phenomena; and second, that the true destination of philosophy must be social, and the true object of the thinker must be the reorganization of the moral, religious and political systems. We can readily see what an impulse these far-reaching conceptions would give to Comte’s meditations. There were conceptions of less importance than these, in which it is impossible not to feel that it was Saint-Simon’s wrong or imperfect idea that put his young admirer on the track to a right and perfected idea. The subject is not worthy of further discussion. That Comte would have performed some great intellectual achievement, if Saint-Simon had never been born, is certain. It is hardly less certain that the great achievement which he did actually perform was originally set in motion by Saint-Simon’s conversation, though it was afterwards directly fertilized with the fertile speculations of A. J. Turgot and Condorcet. Comte thought almost as much of Plato as he did of Saint-Simon, and he considered Aristotle the prince of all true thinkers; yet their vital difference about Ideas did not prevent Aristotle from calling Plato master. After six years the differences between the old and the young philosopher grew too marked for friendship. Comte began to fret under Saint-Simon’s pretensions to be his director. Saint-Simon, on the other hand, perhaps began to feel uncomfortably conscious of the superiority of his disciple. The occasion of the breach between them (1824) was an attempt on Saint-Simon’s part to print a production of Comte’s as if it were on some sort connected with Saint-Simon’s schemes of social reorganization. Not only was it brutally, after the third, long afterwards Comte, as we have said, with painful ungraciousness took to calling the encourager of his youth by very hard names.

In 1825 Comte married a Mlle Caroline Massin. His marriage was one of those of which “magnanimity owes no account to prudence,” and it did not turn out prosperously. His family were strongly Catholic and royalist, and they were outraged by his refusal to have the marriage performed other than civilly. They consented, however, to receive his wife, and the pair went on a visit to Montpellier. Madame Comte conceived a dislike to the circle she found there, and this was the too early beginning of disputes which lasted for the remainder of their union. In the year of his marriage we find Comte writing to the most intimate of his correspondents: “I have nothing left but to concentrate my whole moral existence in my intellectual work, a precious but inadequate compensation; and so I must go on, if not the most dazzling, still the sweetest part of my happiness.” He tried to find pupils to board with him, but only one pupil came, and he was soon away for lack of companions. “I would rather spend an evening,” wrote the needy enthusiast, “in solving a difficult question, than in running after some empty-headed and consequential millionaire in search of a pupil.” A little money was earned by an occasional article in Le Producteur, in which he began to expound the philosophic ideas that were now maturing in his mind. He announced a course of lectures (1826), which it was hoped would bring money as well as fame, and which were to be the first dogmatic exposition of the Positive Philosophy. A friend had said to him, “You talk too freely, your ideas are getting abroad, and other people use them without giving you the credit; put your ownership on record.” The lectures attracted hearers so eminent as Humboldt the cosmologist, Poinset the geometer and Blainville the physiologist.

Unluckily, after the third lecture of the course, Comte had a severe attack of cerebral detumescence, brought on by intense and prolonged meditation, acting on a system that was already irritated by the chagrin of domestic disappointment. He did not recover his health for more than a year, and as soon as
COMTE

convalescence set in he was seized by so profound a melancholy at the disaster which had thus overtaken him, that he threw himself into the Seine. Fortunately he was rescued, and the shock did not stay his return to mental soundness.

One incident of this painful episode is worth mentioning. Laennais, then in the height of his Catholic exaltation, persuaded Comte's mother to insist on her son being married with the religious ceremony, and as the younger Madame Comte apparently did not resist, the rite was duly performed, in spite of the fact that Comte was at the time raving mad. Philosophic assailants of Comtism have not always resisted the temptation to recall the circumstance that its founder was once out of his mind. As has been justly said, if Newton once suffered a cerebral attack without forfeiting our veneration for the Principia, Comte may have suffered in the same way, and still not have forfeited our respect for Positive Philosophy and Positive Polity.

In 1828 the lectures were renewed, and in 1830 was published the first volume of the Course of Positive Philosophy. The sketch and ground plan of this great undertaking had appeared in 1826. The sixth and last volume was published in 1842. The twelve years covering the publication of the first of Comte's two elaborate works were years of indefatigable toil, and they were the only portion of his life in which he enjoyed a certain measure, and that a very modest measure, of material prosperity. In 1833 he was appointed examiner of the boys who in the various provincial schools aspired to enter the École Polytechnique at Paris. This and two other engagements as a teacher of mathematics secured him an income of some £400 a year. He made M. Guizot, then Louis Philippe's minister, the important proposal to establish a chair of general history of the sciences. If there are four chairs, he argued, devoted to the history of philosophy, that is to say, the minute study of all sorts of dreams and aberrations through the ages, surely there ought to be at least one to explain the formation and progress of our real knowledge? This suggestion, still unfulfilled, was at first welcomed, according to Comte's own account, by Guizot's philosophic instinct, and then repulsed by his "metaphysical rancour."

Meanwhile Comte did his official work conscientiously, sorely as he grudged the time which it took from the execution of the great object of his thoughts. "I hardly know if even to you," he writes to his wife, "I dare disclose the sweet and softened feeling that comes over me when I find a young man whose examination is thoroughly satisfactory. Yes, though you may smile, the emotion would easily stir me to tears if I were not carefully on my guard." Such sympathy with youthful hope, in union with industry and intelligence, shows that Comte's dry and austere manner veiled the fires of a generous social emotion. It was this which made him add to his labours the burden of delivering every year from 1831 to 1848 a course of gratifying lectures on astronomy for a popular audience. The social feeling that inspired this disinterested act showed itself in other ways. He suffered imprisonment rather than serve in the national guard; his position was that though he would not take arms against the new monarchy of July, yet being a republican he would take no oath to defend it. The only amusement that Comte permitted himself was a visit to the opera. In his youth he had been a player, but he shortly came to the conclusion that tragedy is a stilted and bombastick art, and after a time comedy interested him no more than tragedy. For the opera he had a genuine passion, which he gratified as often as he could, until his means became too narrow to afford even that single relaxation.

Of his manner and personal appearance we have the following account from one who was his pupil:—"Dally as the clock struck eight on the bordele of the Luxembourg, while the ringing knocker on the bell was yet audible, the door of my room opened, and there entered a man, short, rather stout, almost what one might call sleek, freshly shaven, without vestige of whisker or moustache. He was invariably dressed in a suit of the most spotless black, as if going to a dinner party; his white neck-cloth was fresh from the laundress's hands, and his hat shining like a racer's coat. He advanced to the arm-chair prepared for him in the centre of the writing-table, laid his hat on the left-hand corner; his snuff-box was deposited on the same side beside the quire of paper placed in readiness for his use, and dipping the pen twice into the ink-bottle, then bringing it to within an inch of his nose to make sure it was properly filled, he broke silence: 'We have said that the chord AB,' &c. For three-quarters of an hour he continued his demonstration, making short notes as he went on, to guide the listener in repeating the problem alone; then, taking up another cahier which lay beside him, he went over the written repetition of the former lesson. He explained, corrected or commented till the clock struck nine; then, with the little finger of the right hand brushing from his coat and waistcoat the shutter of superfuous snuff which had fallen on them, he pocketed his snuff-box, and resuming his hat, he sat as silently as when he came in made his exit by the door, which I rushed to open for him."

In 1842, as we have said, the last volume of the Positive Philosophy was given to the public. Instead of that contentment which we like to picture as the reward of twelve years of meritorious toil devoted to the erection of a great house of high philosophic edifice, Comte found himself in the midst of a very sea of small troubles, of that uncompassed kind that harasses without elevating, and wastes a man's spirit without softening or enlarging it. First, the jar of temperament between Comte and his wife had become so unbearable that they separated (1842). We know too little of the facts to allot blame to either of them. In spite of one or two disadvantageous facts in her career, Madame Comte seems to have uniformly comported herself towards her husband with an honourable solicitude for his well-being. Comte made her an annual allowance, and for some years after the separation they corresponded on friendly terms. Next in the list of the vexations was a lawsuit with his publisher. 'The public,' he said, inserted in the sixth volume a protest against a certain footnote, in which Comte had used some hard words about Arago. Comte threw himself into the suit with an energy worthy of Voltaire and won it. Third, and worst of all, he had prefixed a preface to the sixth volume, in which he went out of his way to rouse the enmity of the men on whom depended his annual re-election to the post of examiner for the Polytechnic school. The result was that he lost the appointment, and with it one-half of his very modest income. This was the occasion of an episode, which is of more than merely personal interest.

Before 1842 Comte had been in correspondence with J. S. Mill, who had been greatly impressed by Comte's philosophic ideas; Mill admits that his own System of Logic owes many valuable thoughts to Comte, and that, in the portion of that work which treats of the logic of the moral sciences, a radical improvement in the conception of logical method was derived from the Positive Philosophy. Their correspondence, which was full and copious, turned principally upon the two great questions of the equality between men and women, and of the expediency and constitution of a sacerdotal or spiritual order. When Comte found himself straitened, he confided the entire circumstances to Mill. As might be supposed by those who know the affectionate anxiety with which Mill regarded the welfare of any one whom he believed to be doing good work in the world, he at once took pains to have Comte's loss of income made up to him, until Comte should have had time to repair that loss by his own endeavours. Mill persuaded Grote, Molesworth, and Raikes Currie to advance the sum of £240. At the end of the year (1845) Comte had taken no steps to enable himself to dispense with the aid of the three Englishmen. Mill applied to them again, but with the exception of Grote, who sent a small sum, they gave Comte to understand that they expected him to earn his own living. Mill had suggested to Comte that he should write articles for the English periodicals, and expressed his own willingness to translate any such articles from the French. Comte at first fell in with the plan, but he speedily surprised and disconcerted Mill by boldly taking up the position of "high moral
magistrate," and accusing the three defaulting contributors of a scandalous falling away from righteousness and a high mind. Mill was chilled by these pretensions; and the correspondence came to an end. There is something to be said for both sides. Comte, regarding himself as the promoter of a great scheme for the benefit of humanity, might reasonably look for the support of his friends in the fulfilment of his designs. But Mill and the others were fully justified in not aiding the propagation of a doctrine in which they might not wholly concur. Comte's subsequent attitude of censorious condemnation put him entirely in the wrong.

From 1845 to 1848 Comte lived as best he could, as well as made his wife her allowance, on an income of £200 a year. His little account books of income and outlay, with every item entered down to a few hours before his death, are accurate and neat enough to have satisfied an ancient Roman householder. In 1848, through no fault of his own, his salary was reduced to £80. Litttré and others, with Comte's approval, published an appeal for subscriptions, and on the money thus contributed Comte subsisted for the remaining nine years of his life. By 1852 the subsidy produced as much as £200 a year. It is worth noticing that Mill was one of the subscribers, and that Litttré continued his assistance after he had been driven from France by his political society; by his faith, by his upright will, to be able to record any similar trait of magnanimity on Comte's part. His character, admirable as it is for firmness, for intensity, for inexorable will, for iron devotion to what he thought the service of mankind, yet offers few of those softening qualities that make us love good men and pity bad ones.

It is best to think of him only as the intellectual worker, pursuing in uncomforted obscurity the laborious and absorbing task to which he had given up his whole life. His singularly conscientious fashion of elaborating his ideas made the mental strain more intense than even so exhausting a work as the abstract exposition of the principles of positive science need have been. He did not write down a word until he had first composed the whole matter in his mind. When he had thoroughly meditated every sentence, he sat down to write, and then, such was the grip of his memory, the exact order of his thoughts came back to him as if without an effort, and he wrote down precisely what he had intended to write, without the aid of a note or a memorandum, and without check or proof reading. He began to write his book in 1848, and completed it in about six weeks a chapter in the Positive Philosophy (vol. v. ch. 35) which would fill forty pages of this Encyclopaedia. When we reflect that the chapter is not narrative, but an abstract exposition of the guiding principles of the movements of several centuries, with many threads of complex thought running along side by side all through the speculation, then the circumstances under which it was reduced to literal form are really astonishing. It is hardly possible, however, to share the admiration expressed by some of Comte's disciples for his style. We are not so unreasonable as to blame him for failing to make his pages picturesque or thrilling; we do not want sunsets and stars and roses and ecstasy; but there is a certain standard for the most serious and abstract subjects. When compared with such philosophic writing as Hume's, Diderot's, Berkeley's, then Comte's manner is heavy, laboured, monotonous, without relief and without light. There is now and then an energetic phrase, but as a whole the vocabulary is jejune; the sentences are overloaded; the pitch is flat. A scrupulous insistence on making his ideas clear is not an iteration of certain adjectives and adverbs, which at length deadened the effect beyond the endurance of all but the most resolute students. Only the interest of the matter prevents one from thinking of Rivarol's ill-natured remark upon Condorcet, that he wrote with opium on a page of lead. The general effect is impressive, not by any virtues of style, for we do not discern one, but by reason of the magnitude and importance of the undertaking, and the visible conscientiousness and the grasp with which it is executed. It is by sheer strength of thought, by the vigorous perspicacity with which he strikes the lines of cleavage of his subject, that he makes his way into the mind of the reader; in the presence of gifts of this power we need not quarrel with an ugly style.

Comte pursued one practice which ought to be mentioned in connexion with his personal history, the practice of what he style hygiène cérébrale. After he had acquired what he considered to be a sufficient stock of material, and this happened before he had completed the Positive Philosophy, he abstained from reading newspapers, reviews, scientific transactions and everything else, except two or three poets (notably Dante) and the Imitatio Christi. It is true that his friends kept him informed of what was going on in the scientific world. Still this partial divorce of himself from the record of the social and scientific activity of his time, though it may save a thinker from the deplorable evils of dispersion, moral and intellectual, accounts in no small measure for the exaggerated egoism, and the absence of all feeling for reality, which marked Comte's later days.

In 1845 Comte made the acquaintance of Madame Clotilde de Vaux, a lady whose husband had been sent to the galleys for life. Very little is known about her qualities. She wrote a little piece which Comte rated so preposterously as to talk about George Sand in the same lines. But it is not otherwise; it is in the nature of these works to contain one or two gracious thoughts. There is true beauty in the saying—"It is unworthy of a noble nature to diffuse its pain." Madame de Vaux's letters speak well for her good sense and good feeling, and it would have been better for Comte's later work if she had survived to exert a wholesome restraint on his exaltation. Their friendship had only lasted a year when she died (1846), but the period was long enough to give her memory a supreme ascendancy in Comte's mind. Condillac, Joubert, Mill and other eminent men have shown what the intellectual ascendancy of a woman can be. Comte was inexpressibly sad after Madame de Vaux's death as D'Alembert after the death of Mademoiselle L'Esperas. Every Wednesday afternoon he made a reverential pilgrimage to her tomb, and three times every day he invoked her memory in words of passionate expansion. His disciples believe that in time the world will reverence Comte's sentiment about Clotilde de Vaux, as it reveres Dante's adoration of Beatrice—a parallel that Comte himself was the first to hit upon. Yet we cannot help feeling that it is a grotesque and unseemly anachronism to apply in grave prose, addressed to the whole world, those words of saint and angel which are touching and in their place amid the trouble and passion of the great mystic poet. Whatever other gifts Comte may have had—and he had many of the rarest kind,—poetic imagination was not among them, any more than poetic or emotional expression was among them. His was one of those natures whose faculty of deep feeling is unhappily doomed to be inarticulate, and to pass away without the magic power of transmitting itself.

Comte lost no time, after the completion of his Course of Positive Philosophy, in proceeding with the System of Positive Polity, for which the earlier work was designed to be a foundation. The first volume was published in 1851, and the fourth and last in 1854. In 1848, when the political air was charged with stimulating elements, he founded the Positive Society, with the expectation that it might grow into a reunion as powerful over the new revolution as the Jacobin Club had been in the revolution of 1789. The hope was not fulfilled, but a certain number of philosophic disciples gathered round Comte, and eventually formed themselves into the society of the guardians of the new ideas of the latter half of his life, into a kind of church, for whose use he set up the Positivist Calendar (1849), in which the names of those who had advanced civilization replaced the titles of the saints. Gutenberg and Shakespeare were among the patrons of the thirteen months in this calendar. In the years 1849, 1850 and 1851 Comte gave three courses of lectures at the Palais Royal. They were gratuitous and popular, and in them he boldly advanced the whole of his doctrine, as well as the direct and immediate pretensions of himself and his system. The third course ended
in the following uncompromising terms—"In the name of the Past and of the Future, the servants of Humanity—both its philosophical and its practical servants—come forward to claim as their due the general direction of this world. Their object is to constitute at length a real Providence in all departments,—moral, intellectual and material. Consequently they exclude once for all from political supremacy all the different servants of God—Catholic, Protestant or Deist—as being at once behind-hand and a cause of disturbance." A few weeks after this invitation, a very different person stepped forward to constitute himself a real Providence.

In 1852 Comte published the *Catechism of Positivism*. In the preface to it he took occasion to express his approval of Louis Napoleon's *coup d'etat* of the 2nd of December,—"a fortunate crisis which has set aside the parliamentary system and instituted a dictatorial republic." Whatever we may think of the political sagacity of such a judgment, it is due to Comte to say that he did not expect to see his dictatorial republic transformed into a dynastic empire, and, next, that he did expect from the Man of December freedom of the press and of public meeting. His later hero was the emperor Nicholas, "the only statesman in Christendom,"—as unlucky a judgment as that which placed Dr Francia in the Comtist Calendar.

In 1857 he was attacked by fever, and died peaceably on the 5th of February, 1857, a year. The anniversary is celebrated by ceremonial gatherings of his French and English followers, who then commemorate the name and the services of the founder of their religion. By his will he appointed thirteen executors who were to preserve his rooms at 10 rue Monsieur-le-Prince as the headquarters of the new religion of Humanity.

In proceeding to give an outline of Comte's system, we shall consider the *Positive Polity* as the more or less legitimate sequel of the *Positive Philosophy*, notwithstanding the deep gulf which so eminent a critic as J. S. Mill insisted upon fixing between the earlier and the later work. There may be, as we think there is, the greatest difference in their value, and the temper is not the same, nor the method. But the two are quite capable of being regarded, and for the purposes of an account of Comte's career ought to be regarded, as an integral whole. His letters when he was a young man of one-and-twenty, and before he had published a word, show how greatly that social motive was in his mind, and in what little account he should hold his scientific work if it cannot by itself sustain the utility of the species "I feel," he wrote, "that such scientific reputation as I might acquire would give more value, more weight, more useful influence to my political sermons." In 1822 he published a *Plan of the Scientific Works necessary to reorganize Society*.

**Early writing.**

In this he points out that modern society is passing through a great crisis, due to the conflict of two opposing movements,—the first, a disorganizing movement owing to the break-up of old institutions and beliefs; the second, a movement towards a definite social state, in which all means of human prosperity will receive their most complete development and most direct application. How is this crisis to be dealt with? What are the undertakings necessary in order to pass successfully through it towards an organic state? The answer to this is that there are two series of works. The first is theoretic or spiritual, aiming at the development of a new principle of co-ordinating social relations, and the formation of the system of general ideas which are destined to guide society. The second work is practical or temporal; it settles the distribution of power, and the institutions that are most conformable to the spirit of the system which has previously been thought out in the course of the theoretic work. As the practical work depends on the conclusions of the theoretical, the latter must obviously come first in order of execution.

In 1826 this was pushed farther in a most remarkable piece called *Considerations on the Spiritual Power*, the main object of which is to demonstrate the necessity of instituting a spiritual power, distinct from the temporal power and independent of it. In examining the conditions of a spiritual power proper for modern times, he indicates in so many terms the presence in his mind of a direct analogy between his proposed spiritual power and the functions of the Catholic clergy at the time of its greatest vigour and most complete independence,—that is to say, from about the middle of the 11th century until towards the end of the 13th. He refers to de Maistre's memorable book, *Du Pape*, as the most profound, accurate and methodical account of the old spiritual organization, and starts from that as the model to be adapted to the changed intellectual and social conditions of the modern time. In the *Positive Philosophy*, again (vol. v. p. 344), he distinctly says that Catholicism, reconstituted as a system on new intellectual foundations, would finally preside over the spiritual reorganization of modern society. Much else could be quoted to the same effect. If unity of career, then, means that Comte, from the beginning designed the institution of a spiritual power, and the systematic reorganization of life, it is difficult to deny him whatever credit that unity may be worth, and the credit is perhaps not particularly great. Even the readaptation of the Catholic system to a scientific doctrine was plainly in his mind thirty years before the final execution of the *Positive Polity*, though it is difficult to believe that he foresaw the religious mysticism in which the task was to be attempted. A great analysis was to precede a great synthesis, but it was only the oblique influence of Comte's central ideas on that society. Let us first sketch the nature of the analysis. Society is to be reorganized on the base of knowledge. What is the sum and significance of knowledge? That is the question which Comte's first master-work professes to answer.

The *Positive Philosophy* opens with the statement of a certain law of which Comte was the discoverer, and which has always been treated both by disciples and dissidents as the key to his system. This is the *Law of the Three States*. It is as follows. Each of our leading conceptions, as each branch of our knowledge, passes successively through three different phases; there are three different ways in which the human mind explains phenomena, each way following the other in order. These three stages are the Theological, the Metaphysical and the Positive. Knowledge, or a branch of knowledge, is in the Theological state, when it supposes the phenomena under consideration to be due to immediate volition, either in the object or in some supernatural being. In the Metaphysical state, for volition is substituted abstract force residing in the object, yet existing independently of the object; these forces are in constant succession among themselves, and the properties of each substance have attributed to them an existence distinct from that substance. In the Positive state, inherent volition or external volition and inherent force or abstraction personified have both disappeared from men's minds, and the explanation of a phenomenon means a reference of it, by way of succession or resemblance, to some other phenomenon,—means the establishment of a relation between the given fact and some more general fact. In the Theological and Metaphysical state men seek a cause or an essence; in the Positive they are content with a law. To borrow an illustration from an able English disciple of Comte:—"Take the phenomenon of the sleep produced by opium. The Arabs are content to attribute it to the 'will of God.' Mollière's medical student accounts for it by a soporific principle contained in the opium. The modern physiologist knows that he cannot account for it at all. He can simply observe, analyze and experiment upon the phenomena attending the action of the drug, and classify it with other agents analogous in character." (Dr Bridges.)

The first and greatest aim of the *Positive Philosophy* is to advance the science of somea to the third of the three stages— to remove social phenomena from the sphere of theological and metaphysical conceptions, and to introduce among them the same scientific observation of their laws which has given us physics, chemistry, physiology. Social physics will consist of the conditions and relations of the facts of society, and will have two departments,—one, static, containing the laws of order; the other dynamical, containing the laws of progress. While
men’s minds were in the theological state, political events, for example, were explained by the will of the gods, and political authority based on divine right. In the metaphysical state of mind, then, to retain our instance, political authority was based on the sovereignty of the people, and social facts were explained by the figure of a falling away from a state of nature. When the positive method has been finally extended to society, as it has been to chemistry and physiology, these social facts will be described as their ultimate analysis, into relations with one another, and instead of seeking causes in the old sense of the word, men will only examine the conditions of social existence. When that stage has been reached, not merely the greater part, but the whole, of our knowledge will be impressed with one character, the character, namely, of positivity or scientificness; and all our conceptions in every part of knowledge will be thoroughly homogeneous. The gains of such a change are enormous. The new philosophical unity will now in its turn regenerate all the elements that went to its own formation. The mind will pursue knowledge without the wasteful jar and friction of conflicting methods and mutually hostile conceptions; education will be regenerated; and society will organize itself on the only possible solid base—a homogeneous philosophy.

The Positive Philosophy has another object besides the demonstration of the necessity and propriety of a science of society. This object is to show the sciences as branches from a single trunk,—is to give to science the ensemble or spirit or generality hitherto confined to philosophy, and to give to philosophy the rigour and solidity of science. Comte’s special object is a study of social physics, a science that before his advent was still to be formed; his second object is a review of the methods and leading generalities of all the positive sciences already formed, so that we may know both what system of inquiry to follow in our new science, and also where the new science will stand in relation to other knowledge.

The first step in this direction is to arrange scientific method and positive knowledge in order, and this brings us to another cardinal element in the Comtist system, the classification of the sciences. In the front of the inquiry lies one main division, that, namely, between speculative and practical knowledge. With the latter we have no concern. Speculative or theoretic knowledge is divided into abstract and concrete. The former is concerned with the laws that regulate phenomena in all conceivable cases: the latter is concerned with the application of these laws. Concrete science relates to objects or beings; abstract science to events. The former is particular or descriptive; the latter is general. Thus, physiology is an abstract science; but zoology is concrete. Chemistry is abstract; mineralogy is concrete. It is the method and knowledge of the abstract sciences that the Positive Philosophy has to reorganize in a great whole.

Comte’s principle of classification is that the dependence and order of scientific study follows the dependence of the phenomena. Thus, as has been said, it represents both the objective dependence of the phenomena and the subjective dependence of our means of knowing them. The more particular or complex phenomena depend upon the simpler and more general. The latter are the more easy to study. Therefore science will begin with those attributes of objects which are most general, and pass on gradually to other attributes that are combined in greater complexity. Thus, too, each science rests on the truths of the sciences that precede it, while it adds to them the truths by which it is itself constituted. Comte’s series or hierarchy is arranged as follows:—

(1) Mathematics (that is, number, geometry, and mechanics),
(2) Astronomy, (3) Physics, (4) Chemistry, (5) Biology, (6) Sociology. Each of the members of this series is one degree more special than the member before it, and depends upon the facts of all the members preceding it, and cannot be fully understood without them. It follows that the crowning science of the hierarchy, dealing with the phenomena of human society, will remain longest under the influence of theological dogmas and abstract figments, and will be the last to pass into the positive stage. You cannot discover the relations of the facts of human society without reference to the conditions of animal life; you cannot understand the conditions of animal life without the laws of chemistry; and so with the rest.

This arrangement of the sciences, and the Law of the Three States, are together explanatory of the course of human thought and knowledge. They are thus the double key of Comte’s systematization of the philosophy of all the sciences from mathematics to physiology, and his positive analysis of social evolution, which is the basis of positive sociology. Each science contributes its philosophy.

The co-ordination of all these partial philosophies produces the general Positive Philosophy. “Thousands had cultivated science, and with splendid success; not one had conceived the philosophy which the sciences when organized would naturally evolve. A few had seen the necessity of extending the scientific method to all inquiries, but no one had seen how this was to be effected. . . The Positive Philosophy is novel as a philosophy, not as a collection of truths never before suspected. Its novelty is the organization of existing elements. Its very principle implies the absorption of all that great thinkers had achieved; while incorporating their results it extended their methods. . . What tradition brought was the results; what Comte brought was the organization of these results. He always claimed to be the founder of the Positive Philosophy. That he had every right to such a title is demonstrable to all who distinguish between the positive sciences and the philosophy which co-ordinated the truths and methods of these sciences into a doctrine.”—G. H. Lewes.

Comte’s classification of the sciences has been subjected to a vigorous criticism by Herbert Spencer. Spencer’s two chief points are these:—(1) He denies that the principle of the development of the sciences is the principle of decreasing generality; he asserts that there are as many examples of the advent of a science being determined by increasing generality as by increasing speciality.

(2) He holds that any grouping of the sciences in a succession gives a radically wrong idea of their genesis and their interdependence; no true filiation exists; no science develops itself in isolation; no one is independent, either logically or historically. Litttré, by far the most eminent of the scientific followers of Comte, concedes a certain force to Spencer’s objections, and makes certain secondary modifications in the hierarchy in consequence, while still cherishing his faith in the Comtist theory of the sciences. J. S. Mill, while admitting the objections as good, if Comte’s arrangement pretended to be the only one possible, still holds the arrangement as tenable for the purpose with which it was devised. G. H. Lewes asserts against Spencer that the arrangement in a series is necessary, on grounds similar to those which require that the various truths constituting a science should be systematically co-ordinated although in nature the phenomena are intermingled.

The first three volumes of the Positive Philosophy contain an exposition of the partial philosophies of the five sciences that precede sociology in the hierarchy. Their value has usually been placed very low by the special followers of the sciences concerned; they say that the knowledge is second-hand, is not coherent, and is too confidently taken for final. The Comtist replies that the task is philosophic, and is not to be judged by the minute accuracies of science. In these three volumes Comte took the sciences roughly as he found them. His eminence as a man of science must be measured by his only original work in that department,—the construction, namely, of the new science of society. This work is accomplished in the last three volumes of the Positive Philosophy, and the second and third volumes of the Positive Polity. The Comtist maintains that even if these five volumes together fail in laying down correctly and finally the lines of the new science, still they are the first solution of a great problem hitherto unattempted. “Modern biology has got beyond Aristotle’s conception; but in the construction of the biological science, not even the most unphilosophical biologist would fail to recognize the value of Aristotle’s attempt. So for sociology. Subsequent sociologists may have conceivably to
remodel the whole science, yet not the less will they recognize the merit of the first work which has facilitated their labour."—Comte.

Sociological conceptions.

We shall now briefly describe Comte's principal conceptions in sociology, his position in respect to which is held by himself, and by others, to raise him to the level of Descartes or Leibnitz. Of course the first step was to approach the phenomena of human character and social existence with the expectation of finding them as reducible to general laws as the other phenomena of the universe, and with the hope of exploring these laws by the same instruments of observation and verification as had done such triumphant work in the case of the latter. Comte separates the collective facts of society and history from the individual phenomena of biology; then he withdraws these collective facts from the region of external volition, and places them in the region of law. The facts of history must be explained, not by providential interventions, but by referring them to conditions inherent in the successive stages of social existence. This conception makes a science of society possible. What is the method? It comprises, besides observation and experiment (which is, in fact, only the observation of abnormal social states), a certain peculiarity of verification. We begin by deducing every well-known historical situation from the series of its antecedents. Thus we acquire a body of empirical generalizations as to social phenomena, and then we connect the generalizations with the positive theory of human nature. A sociological demonstration lies in the establishment of an accordance between the conclusions of historical analysis and the preparatory conceptions of biological theory. "As Mill puts it:—

"If a sociological theory, collected from historical evidence, contradicts the established general laws of human nature; if (to use M. Comte's instances) it implies, in the mass of mankind, any very decided natural bent, either in a good or in a bad direction; if it supposes that the reason, in average human beings, predominates over the desires, or the disinterested desires over the personal appetites; if it may know that history has been misrepresented, and that the theory is false. On the other hand, if laws of social phenomena, empirically generalized from history, can, when once suggested, be affiliated to the known laws of human nature; if the direction actually taken by the developments and changes of human society, can be seen to be such as the properties of man and of his dwelling-place made antecedently probable, the empirical generalizations are raised into positive laws, and sociology becomes a science." The result of this method is an exhibition of the events of human experience in co-ordinated series that manifest their own graduated connexion.

Next, as all investigation proceeds from that which is known best to that which is unknown or less well known, and as, in social states, it is the collective phenomenon that is more easy of access to the observer than its parts, therefore we must consider and pursue all the elements of a given social state together and in common. The social organization must be viewed and explored as a whole, there is no existing or leading group of social phenomena and other leading groups; if there is a change in one of them, that change is accompanied by a corresponding modification of all the rest. "Not only must political institutions and social manners, on the one hand, and manners and ideas, on the other, be always mutually connected; but further, this consolidated whole must be always connected by its nature with the corresponding state of the integral development of humanity, considered in all its aspects of intellectual, moral and physical activity."—Comte.

Is there any one element which communicates the decisive impulse to all the rest,—any predominating agency in the course of social evolution? The answer is that all the other parts of social existence are associated with, and drawn along by, the contemporary condition of intellectual development. The Reason is the superior and preponderant element which settles the direction in which all the other faculties shall expand. "It is only through the more and more marked influence of the reason over the general conduct of man and of society, that the gradual march of our race has attained that regularity and persevering continuity which distinguish it so radically from the desultory and barren expansion of even the highest animal orders, which share, and with enhanced strength, the appetites, the passions, and even the primary sentiments of man." The history of intellectual development, therefore, is the key to social evolution, and the key to the history of intellectual development is the Law of the Three States.

Among other central ideas in Comte's explanation of history are these:—The displacement of theological by positive conceptions has been accompanied by a gradual rise of an industrial régime out of the military régime;—the great permanent contribution of Catholicism was the separation which it set up between the temporal and the spiritual powers;—the progress of the race consists in the increasing preponderance of the distinctively human elements over the animal elements;—the absolute tendency of ordinary social theories will be replaced by an unifying adherence to the relative point of view, and from this it follows that the social state, regarded as a whole, has been as perfect in each period as the co-existing condition of humanity and its environment would allow.

The elaboration of these ideas in relation to the history of the civilization of the most advanced portion of the human race occupies two of the volumes of the Positive Philosophy, and has been accepted by very different schools as a masterpiece of rich, luminous, and far-reaching suggestion. Whatever additions it may receive, and whatever corrections it may require, this analysis of social evolution will continue to be regarded as one of the great achievements of human intellect.

The third volume of the Positive Polity treats of social dynamics, and takes us again over the ground of historic evolution. It abounds with remarks of extraordinary fertility and comprehensiveness; but it is often arbitrary; and its views of the past are strained into coherence with the static views of the preceding volume. As it was composed in rather less than six months, and as the author honestly warns us that he has given all his attention to a more profound co-ordination, instead of working out the special explanations more fully, as he had promised, we need not be surprised if the result is disappointing to those who had mastered the corresponding portion of the Positive Philosophy. Comte explains the difference between his two works. In the first his "chief object was to discover and demonstrate the laws of progress, and to exhibit in one unbroken sequence the collective destinies of mankind, till then invariably regarded as a series of events wholly beyond the reach of explanation, and almost depending on arbitrary will. The present work, on the contrary, is addressed to those who are already sufficiently convinced of the certain existence of social laws, and desire only to have them reduced to a true and conclusive system."

The main principles of the Comtian system are derived from the Positive Polity and from two other works,—the Positivist Catechism: a Summary Exposition of the Universal Religion, in Twelve Dialogues between a Woman and a Priest of Humanity; and, second, The Subjective Synthesis (1856), which is the first and only volume of a work upon mathematics announced at the end of the Positive Philosophy. The system for which the Positive Philosophy is alleged to have been the scientific preparation contains a Polity and a Religion; a complete arrangement of life in all its aspects, giving a wider sphere to Intellect, Energy and Feeling than could be found in any of the previous organic types,—Greek, Roman or Catholic-feudal. Comte's immense superiority over such pre-revolutionary utopians as the Abbé Saint Pierre, no less than over the group of post-revolutionary utopians, is especially visible in this firm grasp of the cardinal truth that the improvement of the social organism can only be effected by a moral development, and never by any changes in mere political mechanism, or any violence in the way of an artificial redistribution of wealth. A moral transformation must precede any real advance. The aim, both in public and private life, is to
secure to the utmost possible extent the victory of the social feeling over self-love, or Altruism over Egoism. 1 This is the key to the regeneration of social existence, as it is the key to that unity of individual life which makes all our energies converge freely and without wasteful friction towards a common end. What are the instruments for securing the preponderance of Altruism? Clearly they must work from the strongest element in human nature, and this element is Feeling or the Heart. Under the Catholic system the supremacy of Feeling was abused, and the Intellect was made its slave. Then followed a revolt of Intellect against Sentiment. The business of the new system will be to bring back the Intellect into a condition, not of slavery, but of willing ministry to the Feelings. The subordination never was, and never will be, effected except by means of a religion, and a religion, to be final, must include a harmonious synthesis of all our conceptions of the external order of the universe. The characteristic basis of a religion is the existence of a Power without us, so superior to ourselves as to command the complete submission of our whole life. This basis is to be found in the Positive stage, in Humanity, past, present and to come, conceived as the Great Being.

The Religion of humanity.

A deeper study of the great universal order reveals to us at length the true character of the Great Being. It is assigned to the destiny it is to bring that order continually to perfection by constantly conforming to its laws, and which thus best represents to us that system as a whole. This undeniable Providence, the supreme dispenser of our destinies, becomes in the natural course the common center of our conceptions of things, and our affection. Although this Great Being evidently exceeds the utmost strength of any, even of any collective, human force, its necessary constitution and its peculiar function endow it with the true sympathy towards all its servants. The least amongst us can and ought constantly to aspire to maintain and even to improve this Being. This natural object of all our activity, both public and private, determines the true general character of the rest of our existence, whether in feeling or in the act; which must be thoughts, and our actions, which must be the expression of our feelings, by whatever means, to serve our Providence, by a wise use of all the means which it furnishes to us. Reciprocally this continued service, whilst strengthening our true unity, renders us at once both happier and better.

The exaltation of Humanity into the throne occupied by the Supreme Being under monothetic systems made all the rest of Comte's construction easy enough. Utility remains the test of every institution, impulse, act; his fabric becomes substantially an arch of utilitarian proposi-
tions, and the pattern of a fabric is the idea of utility. To such an idea a system is formed, and men know it, are prepared to keep them in their place. The Comtist system is utilitarianism crowned by a fantastic decoration. Translated into the plainest English, the position is as follows: "Society can only be regenerated by the greater subordination of politics to morals, by the moralization of capital, by the renovation of the family, by a higher conception of marriage and so on. These ends can only be reached by a heartier development of the sympathetic instincts. The sympathetic instincts can only be developed by the Religion of Humanity." Looking at the problem in this way, even a moralist who does not expect theology to be the instrument of social revival, might still ask whether the sympathetic instincts will not necessarily be already developed to their highest point, before people will be persuaded to accept the religion, which is at the bottom hardly more than sympathy under a more imposing name. However that may be, the whole battle—into which we shall not enter—as to the legitimateness of Comtism as a religion turns upon this ejection of Humanity into a Being. The various hypotheses, dogmas, proposals, as to the creation by, to capital, &c., are merely propositions measurable by consideration of the relative extent of the exigencies and needs. Many of these proposals are of the highest interest, and many of them are actually available; but there does not seem to be one of them of an available kind, which could not equally well be approached from other sides, and even incorporated in some radically antagonistic system. Adoption, for example, as a practice for improving the happiness of families and the welfare of society, is capable of being weighed, and can in truth only be weighed, by utilitarian considerations, and has been commended by men to whom the Comtist religion is naught. The singularity of Comte's construction, and the test by which it must be tried, is the transfer of the worship and discipline of Catholicism to a system in which "the conception of God is superseded" by the abstract idea of Humanity, conceived as a kind of Personality.

And when all is said, the invention does not help us. We have still to settle what is for the good of Humanity, and we can only do that in the old-fashioned way. There is no guidance in the conception. No effective unity can follow from it, because you can only find out the right and wrong of a given course by summing up the advantages and disadvantages, and striking a balance, and there is nothing in the Religion of Humanity to force two men to find the balance on the same side. The Comtists are no better off than other utilitarians in judging policy, events, conduct.

The particularities of the worship, its minute and truly ingenious re-adaptations of sacraments, prayers, reverent signs, down even to the invocation of a New Trinity, need not detain us. They are said, though it is not easy to believe, to have been elaborated by way of Utopia. If so, no Utopia has ever yet been presented in a style so little calculated to stir the imagination, to warm the feelings, to touch the heart. The achievement of a principle of reason — in the most dogmatic and peremptory form to which language can lend itself. And there is no more extraordinary thing in the history of opinion than the perversity with which Comte has succeeded in clothing a philosophic doctrine, so intrinsically conciliatory as his, in a shape that excites so little sympathy and gives so much provocation. An enemy defined Comtism as Catholicism minus Christianity, to which an able champion retorted by calling it Catholicism plus Science. Comte's Utopia has pleased the followers of the Catholic, just as little as those of the scientific, spirit.

The elaborate and minute systematization of life, proper to the religion of Humanity, is to be directed by a priesthood. The priests are to possess neither wealth nor material power; they are not to command, but to counsel; their authority is to rest on persuasion, not on force. When Religion has become positive, and society industrial, then the influence of the church upon the state becomes really free and independent, which was not the case in the middle ages. The power of the priesthood remains no longer material and external, but it inwards intellectual eminence must also be added moral providence and a certain greatness of character, without which force of intellect and completeness of attainment will not receive the confidence they ought to inspire. The functions of the priesthood are of this kind:—To exercise a systematic direction over education; to hold a consultative influence over all the important acts of actual life, public and private; to arbitrate in cases of practical conflict; to preach sermons recalling those principles of generality and universal harmony which our special activities dispose us to ignore; to order the due classification of society, to perform the various ceremonies appointed by the founder of the religion. The authority of the priesthood is to rest wholly on voluntary adhesion, and there is to be perfect freedom of speech and discussion. This provision hardly consists with Comte's congratulations to the tsar Nicholas on the wise vigilance with which he kept watch over the importation of Western books.

From his earliest manhood Comte had been powerfully impressed by the necessity of elevating the condition of women. (See remarkable passage in his letters to M. Valat, pp. 41-5.) His friendship with Madame de Vaux had deepened the impression, and in the reconstructed society women are to play a highly important part. They are to be carefully excluded from public action, but they are to do many more important things than things practical. To fit them for their functions, they are to be raised above material cares, and they are to be thoroughly educated. The family, which is so important an element of the Comtist scheme of things, exists to carry the influence of woman over man to the highest point of cultivation. Through affection she purifies the activity of

COMUS—CONANT

Man. "Superior in power of affection, more able to keep both the intellectual and the active powers in continual subordination to feeling, women are formed as the natural intermediaries between Humanity and man. The Great Being confides especially to them its moral Providence, maintaining through them the direct and constant cultivation of universal affection, in the midst of all the distractions of thought or action, which are for ever withdrawing men from its influence. ... Beside the uniform influence of every woman on every man, to attach him to Humanity, such is the importance and the difficulty of this ministry that each of us should be placed under the special guidance of one of these angels, to answer for him, as it were, to the Great Being. This moral guardianship may assume three types,—the mother, the wife and the daughter; each having several modifications, as shown in the concluding volume. Together they form the three simple modes of solidarity, or unity with contemporaries,—obedience, union and protection— as well as the three degrees of continuity between ages, by uniting us with the past, the present and the future. In accordance with my theory of the brain, each corresponds with one of our three altruistic instincts—veneration, attachment and benevolence."

How the positive method of observation and verification of real facts has landed us in this, and much else of the same kind, is extremely hard to guess. Seriously to examine an encyclopaedic system, that touches life, society and its method at one point, is evidently beyond the compass of such an article as this. There is in every chapter a whole group of speculative suggestions, each of which would need a long chapter to itself to elaborate or to discuss. There is at least one biological speculation of astounding audacity, that could be examined in nothing less than a treatise. Perhaps we have said enough to show that after performing a great and real service to thought Comte almost sacrificed his claims to gratitude by the invention of a system that, as such, and independently of detached suggestions, is markedly retrograde. But the world will take what is available in Comte, while forgetting that in his work which is as irrational in one way as Hegel is in another.

Mill à Auguste Comte publ. avec les réponses de Comte (1859).

CONAN

COMUS (from κόμος, revel, or a company of revellers), in the later mythology of the Greeks, the god of festive mirth. In classical mythology the personification does not exist; but Comus appears in the Eleusis, or Descriptions of Pictures, of Philostratus, a writer of the 3rd century A.D. as a winged youth, slumbering in a standing attitude, his legs crossed, his countenance flushed with wine, his head—which is sunk upon his breast—crowned with dewy flowers, his left hand feebly grasping a hunting spear, his right an inverted torch. Ben Jonson introduces Comus, in his masque entitled Pleasure reconciled to Virtue (1619), as the portly jovial patron of good cheer, "First father of sauce and deviseur of jelly." In the Comus, sive Phagoisiosia Cimmeria; Somnium (1608, and at Oxford, 1634), a moral allegory by a Dutch author, Hendrik van der Putten, or Erycius Puteanus, the conception is more nearly akin to Milton’s, and Comus is a being whose enticements are more disguised and delicate than those of Jonson’s deity. But Milton’s Comus is a creation of his own. His story is one

"Which never yet was heard in tale or song
From old or modern bard, in hall or bower."

Born from the loves of Bacchus and Circe, he is "much like his father, but his mother more"—a sorcerer, like her, who gives to travellers a magic draught that changes their human face into the "brutal form of some wild beast," and, hiding them from their own foul disfigurement, makes them forget all the pure ties of life, "to roll with pleasure in a sensual sty.""

COMYN, JOHN [d. c. 1306], Scottish baron, was a son of John Comyn (d. 1274), of Galloway, who was a nephew of the constable of Scotland, Alexander Comyn, earl of Buchan (d. 1289), and of the powerful and wealthy Walter Comyn, earl of Mentieth (d. 1258). With his uncle the earl of Buchan, the elder Comyn took a prominent part in the affairs of Scotland during the latter part of the 13th century, and he had interests and estates in England as well as in his native land. He fought for Henry III. at Northampton and at Lewes, and was afterwards imprisoned for a short time in London. The younger Comyn, who had inherited the lordship of Badenoch from his great-uncle the earl of Mentieth, was appointed one of the guardians of Scotland in 1286, and shared in the negotiations between Edward I. and the Scots in 1289 and 1290. When Margaret, the Maid of Norway, died in 1290, Comyn was one of the claimants for the Scottish throne, but he did not press his candidature, and like the other Comyns urged the claim of John de Balliol. After supporting Balliol in his rising against Edward I., Comyn submitted to the English king in 1296; he was sent to reside in England, but returned to Scotland shortly before his death.

Comyn’s son, John Comyn (d. 1306), called the "red Comyn," is medically obsolete. Like his father he assisted Balliol in his rising against Edward I., and he was for some time a hostage in England. Having been made guardian of Scotland after the battle of Falkirk in 1298 he led the resistance to the English king for about five years, and then early in 1304 made an honourable surrender. Comyn is chiefly known for his memorable quarrel with Robert the Bruce. The origin of the dispute is uncertain. Doubtless the two regarded each other as rivals; Comyn may have refused to join in the insurrection planned by Bruce. At all events the pair met at Dumfries in January 1306; during a heated altercation charges of treachery were made, and Comyn was stabbed to death either by Bruce or by his followers.

Another member of the Comyn family who took an active part in Scottish affairs during these troubled times is John Comyn, earl of Buchan (d. c. 1313). This earl, a son of Earl Alexander, was constable of Scotland, and was first an ally and then an enemy of Robert the Bruce.

CONACRE (a corruption of corn-acre), in Ireland, a system of letting land, mostly in small patches, and usually for the growth of potatoes as a kind of return instead of wages. It is now practically obsolete.

CONANT, THOMAS JEFFERSON (1802–1891), American Biblical scholar, was born at Brandon, Vermont, on the 13th of December 1802. Graduating at Middlebury College in 1823, he became tutor in the Columbian University (now George
Washington University) from 1825 to 1827, professor of Greek, Latin and German at Waterville College (now Colby College) from 1827 to 1832, professor of biblical literature and criticism in Hamilton (New York) Theological Institute from 1833 to 1851, and professor of Hebrew and of Biblical exegesis in Rochester Theological Seminary from 1851 to 1857. From 1857 to 1875 he was employed by the American Bible Society in New York, and in 1871 he published his own work on the subject. He married in 1850 Hannah O'Brien Chaplin (1809-1865), who was herself the author of The Earnest Man, a biography of Adoniram Judson (1855), and of The History of the English Bible (1859), besides being her husband's able assistant in his Hebrew studies. He died in Brooklyn, New York, on the 30th of April 1891. Conant was the foremost Hebrew scholar of his time in America. His treatise, The Meaning and Use of "Baptism" Philologically and Historically Investigated (1860), an "appendix to the revised version of the Gospel by Matthew," is a valuable summary of the evidence for Baptist doctrine. He translated and edited Gesenius's Hebrew Grammar (1839; 1877), and published revised versions with notes of Job (1850), Genesius (1868), Psalms (1871), Proverbs (1872), Isaiah i.-xiii. 22 (1874), and Historical Books of the Old Testament, Joshua ii. ii. Kings (1834).

CONAN, Alexander (1879-1976), Italian painter of the Florentine school, was born at Gaeta, and studied at Naples under Francesco Solimena. In 1766, along with his brother Giovanni, he journeyed to Rome, where he was received into the Convent of Santa Maria della Scala. He remained there for several years he worked in chalk only, to improve his drawing. He was patronized by the Cardinal Ottoboni, who introduced him to Clement XI.; and a Jeremiah painted in the church of St John Lateran was rewarded by the pope with knighthood and by the cardinal with a diamond cross. His fame grew quickly, and he received the patronage of most of the crowned heads of Europe. He painted till near the day of his death, and left behind him an immense number of pictures, mostly of a brilliant and showy kind, which are distributed among the churches of Italy. Of these the Probatica, or Pool of Siloam, in the hospital of Santa Maria della Scala, at Siena, is considered the finest.

CONCARNEAU, a fishing port of western France in the department of Finistère, 14 m. by road S.E. of Quimper. Pop. (1866) 5,067. The chief products are fish, shellfish, and

CONCEPCION—CONCEPTION

CONCEPCION, a province of southern Chile, lying between the provinces of Maule and Ñuble on the N. and Ñbio-Ñbio on the S., and extending from the Pacific to the Argentine boundary. Its outline is very irregular, the Ñita river forming its northern boundary, and the Ñbio-Ñbio and one of its tributaries a part of its southern boundary. Area (estimated) 3,350 sq. m.; pop. (1895) 188,990. Concepción is the most important province of southern Chile because of its advantageous commercial position, fertility and productive industries. Its coast is indented by two large well-sheltered bays, Talcahuano and Arazco, the former having the ports of Talcahuano, Ñenco and El Ñomé, and the latter Concepcion, and the latter Coronel and Lota. Its railway communications are good, and the Ñbio-Ñbio, which crosses its S.W. corner, has 100 m. of navigable channel. The province produces wheat and manufactures flour for export; its wines are reputed the best in Chile, cattle are bred in large numbers, wool is produced, and considerable timber is shipped. Near the coast are extensive deposits of coal, which is shipped from Lota and Concepción, the former being the site of the most productive coal-mine in South America. The climate is mild and the rainfall is abundant. Large copper-smelting and glass works have been established at Lota because of its coal resources. The valley of the Ñita is largely devoted to vine cultivation, and the port of this district, El Ñomé, is noted for its wine vats and trade. It also possesses a small woolen factory. The principal towns are on the coast and had in 1895 the following populations: Talcahuano, 10,431; Lota, 9,797 (largely operatives in the mines and smelting works); Coronel, 4,573; and El Ñomé, 3,977.

CONCEPCIÓN, a city of southern Chile, capital of a province and department of the same name, on the right bank of the Ñbio-Ñbio river, 7 m. above its mouth, and 355 m. S.W. of Santiago by rail. Pop. (1895) 39,877; (1902, estimated) 49,331. It is the commercial centre of a rich agricultural region, but because of obstructions at the mouth of the Ñbio-Ñbio its trade passes in great part through the port of Talcahuano, 8 m. distant by rail. The small port of Ñenco, situated on the same bay and 10 m. distant by rail, also receives a part of the trade because of official restrictions at Talcahuano. Concepción is one of the southern termini of the Chilean central railway, by which it is connected with Santiago to the N. and with Ññapo to the S., and with the port of Talcahuano. Another line extends southward through the Chilean coal-producing districts to Curanilhú, crossing the Ñbio-Ñbio by a steel viaduct 6000 ft. long on 62 skeleton piers; and a short line of 10 m. runs
CONCEPCIÓN—CONCERTINA

northward to Penco. The Bio-Bio is navigable above the city for 100 m. and considerable traffic comes through this channel. The districts tributary to Concepción produce wheat, wine, wool, and coal and timber, and among the industrial establishments of the city are flour mills, furniture and carriage factories, distilleries and breweries. The city is built on a level plain but little above the sea-level, and is laid out in regular squares with broad streets. It is an episcopal seat with a cathedral and several fine churches, and is the seat of a court of appeal. The city was founded by Pedro de Valdivia in 1550, and received the singular title of “La Concepción del Nuevo Extremo.” It was located on the bay of Talcahuano where the town of Penco now stands, about 9 m. from its present site, but was destroyed by earthquakes in 1570, 1730 and 1751, and was then (1755) removed to the margin of the Bio-Bio. In 1835 it was again laid in ruins, a graphic description of which is given by Charles Darwin in The Voyage of H.M.S. Beagle. The city was twice burned by the Araucanians during their long struggle against the Spanish colonists.

CONCEPCIÓN, or VILLA CONCEPCIÓN, the principal town and a river port of northern Paraguay, on the Paraguay river, 138 m. (234 m. by river) N. of Asunción, and about 345 ft. above sea-level. Pop. (1895, estimate) 15,000, largely Indians. It is an important port of call for the river steamers trading with the Brazilian town of Corumbá, Matto Grosso. It is the principal point for the exportation of Paraguay tea, or “yerba maté” (Ilex paraguayanensis). The town has a street railway and telephone service, a national college, a public school, a market, and some important commercial establishments. The neighbouring country is sparsely settled and produces little except forest products. Across the river, in the Paraguayan Chaco, is an English missionary station, whose territory extends inland among the Indians for many miles.

CONCEPT (Lat., conceptus, a thought, from concipere, to take together, combine in thought; Ger. Begriff), in philosophy, a term applied to a general idea derived from and considered apart from the particulars observed by the senses. The mental process by which this idea is obtained is called abstraction (q.v.). By the comparison, for instance, of a number of boats, the mind abstracts a certain common quality or qualities in virtue of which the mind affirms the general idea of “boat.” Thus the common notion of “boat” is based upon the consideration of the common qualities or at least of the common qualities abstracted. When the various objects are regarded as alike, whatever their individual peculiarities may be, is described as a “concept.” The psychic process by which a concept is affirmed is called “Conception,” a term which is often loosely used in a concrete sense for “Concept” itself. It is also used even more loosely as synonymous in the widest sense with “idea,” “notion.” Strictly, however, it is contrasted with “perception,” and implies the mental reconstruction and combination of sense-given data. Thus when one carries one’s thoughts back to a series of events, one constructs a psychic whole made up of parts which take definite shape and character by their mutual interrelations. This process is called conceptual synthesis, the possibility of which is a sine qua non for the exchange of information by speech and writing. It should be noticed that this (very common) psychological interpretation of “concept” differs from the metaphysical or general philosophical definition given above, in so far as it includes mental presentations in which the universal is not specifically distinguished from the particulars. Some philosophers deny the universal distinction in the narrower use which excludes all mental states in which particulars are cognized, even though the universal be present also.

In biology conception is the coalescence of the male and female generative elements, producing pregnancy.

The word “conceit” in its various senses (“idea,” “plan,” “fancy,” “imagination,” and, by modern extension, an overweening sense of one’s own value) is likewise derived ultimately from the Latin concipere. It appears to have been formed directly from the English derivative “conceive” on the analogy of “deceive” from “deceive.” According to the New English Dictionary there is no intermediate form in Old French.

CONCEPTUALISM (from “Concept”), in philosophy, a term applied by modern writers to a scholastic theory of the nature of universals, to distinguish it from the two other views of Nominalism and Realism. The scholastic philosophers took up the old Greek problem as to the nature of true reality—whether the general idea or the particular object is more truly real. Between Realism which asserts that the genus is more real than the species, and that particulars have no reality, and Nominalism according to which genus and species are merely names (nomena, status vocis), Conceptualism takes a mean position. The conceptualist holds that universals have a real existence, but only in the mind, as the concepts which unite the individual things: e.g. there is in the mind a general notion or idea of boats, by reference to which the mind can decide whether a given object is, or is not, a boat. On the one hand “boat” is something more than a mere sound with a purely arbitrary conventional significance; on the other it has, apart from particular things to which it applies, no reality; its reality is purely abstract or conceptual. This theory was enunciated by Abelard in opposition to Roscellinus (nominalist) and William of Champeaux (realist). He held that it is only by becoming a predicate that the class-nature or general term acquires reality. Thus similarity (conceptus) is not the same as contact between a number of objects in respect of a particular quality or qualities. This quality becomes real as a mental concept when it is predicated of all the objects possessing it (“quod de pluribus natum est praedicari”). Hence Abelard’s theory is alternatively known as Sermonism (sermo, “predicate”). His statement of this position oscillates markedly, inclining sometimes towards the nominalist, sometimes towards the realist statement, using the arguments of the one against the other. Hence he is described by some as a realist, by others as a nominalist. When he comes to explain that objective similarity in things which is represented by the class-concept or general term, he adopts the theological Platonic view that the ideas which are the archetypes of the qualities exist in the mind of God. They are, therefore, ante rem, in re and post rem, or, as Avicenna stated it, universalia ante multiplicatem, in multiplicate, post multiplicate. (See Logic, Metaphysics.)

CONCERT (through the French from Lat. concert-, with, and certare, to strive), a term meaning, in general, co-operation, agreement or union; the more specific usages being, in music, for a public performance by instrumentalists or vocalists or both combined, and in diplomacy, for an understanding or agreement for common action between two or more states, whether defined by treaty or not. The term “Concert of Europe” has been commonly applied, since the congress of Vienna (1814–1815), to the European powers consulting or acting together in questions of common interest. (See Alliance and Europe: History.)

CONCERTINA, or MELODION (Fr. concertina, Ger. Ziehharmonika or Bandonone), a wind instrument of the seraphine family with free reeds, forming a link in the evolution of the harmonium from the mouth organ, intermediate links being the cheng and the accordion. The concertina consists of two hexagonal or rectangular keyboards connected by a long expansible bellows of many folds similar to that of the accordion. The keyboards are furnished with rows of knobs, which, on being pressed down by the fingers, open valves admitting the air compressed by the bellows to the free reeds, which are thus set in vibration. These free reeds consist of narrow tongues of brass riveted by one end to the inside surface of the keyboard, and by the other to the outside. When the valves are pressed down backwards, the former actuated by suction when the bellows are expanded, the latter by compression. The pitch of the note depends upon the length and thickness of the reeds, reduction of the length tending to sharpen the pitch of the note, while reduction of the thickness lowers it. The bellows being unprovided with a valve can only draw in and emit the air through the reed valves. In order to produce the sound, the concertina is held horizontally between the hands, the bellows being by turns compressed and expanded. The English concertina, invented and patented by Sir Charles Wheatstone in 1829, the year of the
reputed invention of the accordion (q.v.), is constructed with a double action, the same note being produced on compressing and expanding the bellows, whereas in the German concertina or accordion two different notes are given out. Concertinas are made in complete families—treble, tenor, bass and double bass, having a combined total range of nearly seven octaves. The compass is as follows:—

- Treble concertina, double action
- Tenor concertina, single action
- Bass concertina, single action
- Double bass concertina, single action

The timbre of the concertina is penetrating but soft, and capable of the most delicate gradations of tone. This quality is due to a law of acoustics governing the vibration of free reeds by means of which *fortes* and *pianos* are obtained by varying the pressure of the wind, as is also the case with the double reed or the single reed, while the pressure of the wind with the lips combined with greater pressure of wind produces the harmonic overtones which are not given out by free reeds.

The English concertina possesses one peculiarity which renders it unsuitable for playing with instruments tuned according to the law of equal temperament, such as the pianoforte, harmonium or melodian, i.e., it has inharmonic intervals between *G*₂ and *A*₂, and between *D*₇ and *E*₂. The German concertina is not constructed according to this system; its compass extends down to *C* or even *B*₃, but it is not provided with double action. It is possible on the English concertina to play diatonic and chromatic passages or arpeggios in legato or staccato style with rapidity, shaking single and double in thirds; it is also possible to play in parts as on the pianoforte or organ and to produce very rich chords. Concertos were written for concertina with orchestra by Molique and Regondi, a sonata with piano by Molique, while Tschaikowsky scored in his second orchestral suite for four accordions.

The aeaol, constructed by the representatives of the original firm of Wheatstone, is still more artistically developed concertina, having among other improvements steel reeds instead of brass, which increase the purity and delicacy of the timbre.

See also ACCORDION; CHENG; HARMONIUM; FREE-REED VIBRATOR.

**CONCERTO** (Lat. *concertus*, from *certare*, to strive, also confused with *concentus*), in music, a term which appears as early as the beginning of the 17th century, at first as a title of no very definite meaning, but which early acquired a sense justified by its etymology and became applied chiefly to compositions in which unequal instrumental or vocal forces are brought into opposition.

Although by Bach's time the concerto as a polyphonic instrumental form was thoroughly established, the term frequently appears in the autograph title-pages of his church cantatas, even when the cantata contains no instrumental prelude. Indeed, so entirely does the actual concerto form, as Bach understands it, depend upon the opposition of masses of tone unequal in volume with a compensating inequality in power of commanding attention, that Bach is able to rewrite an instrumental movement as a chorus without the least incongruity of style. A splendid example of this is the first chorus of a university festival cantata, *Vereinigte Zweiacht der wechselnden Seen*, the very title of which ("united contest of turn-about strings") is a perfect definition of the earlier form of concerto grosso, in which the chief mass of the orchestra was opposed, not to a mere solo instrument, but to a small group called the *concertino*, or else the whole work was for a large orchestral mass in which tutti passages alternate with passages in which the whole orchestra is dispersed in every possible kind of grouping. But the special significance of this particular chorus is that it is arranged from the second movement of the first Brandenburg concerto; and that while the orchestral material is unaltered except for transposition of key, enlargement of force and substitution of trumpets and drums for the original horns, the whole chorus part has been evolved from the solo part for a kit violin (violino piccolo). This admirably illustrates Bach's grasp of the true idea of a concerto, namely, that whatever the relations may be between the forces in respect of volume or sound, the whole treatment of the form must depend upon the healthy relation of function between that force which commands more and that which commands less attention. *Ceteris paribus* the individual, suitably placed, will command more attention than the crowd, whether in real life, drama or instrumental music. And in music the human voice, with its human words, will thrust any orchestral force into the background, the moment it can make itself heard at all. Hence it is not surprising that the earlier concerto forms should show the closest affinity (not only in general aesthetic principle, but in many technical details) with the form of the vocal aria, as matured by Alessandro Scarlatti. And the treatment of the orchestra is, *mutatis mutandis*, exactly the same in both. The orchestra is entrusted with a highly pregnant and short summary of the main contents of the movement, and the solo, or the groups corresponding thereto, will either take up this material or first introduce new themes to be combined with it, and, in short, enter into relations with the orchestra very like those between the actors and the chorus in Greek drama. If the aria before Mozart may be regarded as a single large melody expanded by the device of the ritornello so as to give full expression to the power of a singer against an instrumental accompaniment, so the polyphonic concerto form may be regarded as an expansion of the aria form to a scale worthy of the larger and more instrumental forces employed, and so rendered capable of absorbing large polyphonic forms, by which the aria had attained its full dimensions through the addition of a second strain in foreign keys followed by the original strain *da capo*, was absorbed by the polyphonic concerto on an enormous scale, both in first movements and finales (see Bach's Klavier concerto in E, Violin concerto in E, first movement), while for slow movements the *ground bass* (see VARIATIONS), diversified by changes of key (Klavier concerto in D minor), the more melodic types of binary form, sometimes with the repeats ornamentally varied or inverted (Concerto for 3 violins in D minor, Concerto for clarinet, flute and violin in A minor), and in finales the *rondo form* (Violin concerto in E major, Klavier concerto in F minor) and the binary form (3rd Brandenburg concerto) may be found.

When conceptions of musical form changed and the modern sonata style arose, the peculiar conditions of the concerto gave rise to problems the difficulty of which only the highest classical intellects could appreciate or solve. The number and contrast of the themes necessary to work out a first movement of a sonata are far too great to be contained within the single musical sentence of Bach's and Handel's ritornello, even when it is as long as the thirty bars of Bach's Italian concerto (a work in which every essential of the polyphonic concerto is reproduced on the harpsichord by means of the contrasts between its full register on the lower of its two keyboards and its solo stops on both). Bach's sons had taken shrewd steps in forming the new style; and Mozart, as a boy, modelled himself closely on Johann Christian Bach, and by the time he was twenty was able to write concerto ritornellos that gave the orchestra admirable opportunity for asserting its character and resource in the statement in charmingly epigrammatic style of some five or six sharply contrasted themes, afterwards to be worked out with additions by the solo with the orchestra's co-operation and intervention. As the scale of the works increases the problem becomes very difficult, because the alternation between solo and
tutti easily produces a sectional type of structure incompatible with the high degree of organization required in first movements; yet frequent alternation is evidently necessary, as the solo is audible only above a very subdued orchestral accompaniment, and it would be highly inartistic to use the orchestra for no other purpose. Hence in the classical concerto the ritornello is never abandoned, in spite of the enormous dimensions to which the sonata style expanded it. And though from the time of Mendelssohn onwards many composers have seemed to regard it as a conventional impediment easily abandoned, it may be doubted whether any modern concerto, except the four magnificent examples of Brahms, and Dr Joachim's Hungarian concerto, possesses first movements in which the orchestra seems to enjoy breathing space. And certainly in the classical concerto the entry of the solo instrument, after the long opening tutti, is always dramatic in direct proportion to its delay. The great danger in handling so long an orchestral prelude is that the work may for some minutes be indistinguishable from a symphony and thus the entry of the solo may be unexpected without being inevitable. This is especially the case if the concerto has treated his opening tutti like the exposition of a sonata movement, and made a deliberate transition from his first group of themes to a second group in a complementary key, even if the transition is only temporary, as in Beethoven's C minor concerto. Mozart keeps his whole tutti in the tonic, relieved only by his mastery of sudden subsidiary modulation; and so perfect is his marshalling of his resources that in his hands a tutti a hundred bars long passes by with the effect of a splendid pageant, of which the meaning is evidently about to be revealed by the solo. After the C minor concerto, Beethoven grasped the true function of the opening tutti and enlarged it to his new purposes. With an interesting experiment of Mozart's before him, he, in his G major concerto, Op. 53, allowed the solo player to state the opening theme, making the orchestra enter pianissimo in a foreign key, a wonderful incident which has led to the absurd statement that he "abolished the opening tutti," and that Mendelssohn in so doing has "followed his example." In this concerto he also gave considerable variety of key to the opening tutti by the use of an important thematic shift of a considerable series of modulations, an entirely different thing from a deliberate modulation from material in one key to material in another. His fifth and last pianoforte concerto, in E flat, commonly called the "Emperor," begins with a rhapsodical introduction of extreme brilliance for the solo player, followed by a tutti of unusual length which is confined to the tonic major and minor with a strictness explained by the gorgeous modulations with which the solo subsequently treats the second subject. In this concerto Beethoven also dispenses with the only really conventional form of the form, namely, the cadenza, a custom elaborated from the operatic aria, in which the singer was allowed to extemporize a flourish on a pause near the end. A similar pause was made in the final ritornello of a concerto, and the soloist was supposed to extemporize what should be equivalent to a symphonic coda, with results which could not but be deplorable unless the player (or cadenza writer) were either the composer himself, or capable of entering into his intentions, like Joachim, who has written the finest extant cadenza of classical violin concertos.

Brahms's first concerto in D minor, Op. 15, was the result of an immense amount of work, and, though on a mass of material originally intended for a symphony, was nevertheless so perfectly assimilated into the true concerto form that in his next essay, the violin concerto, Op. 77, he had no more to learn, and was free to make true innovations. He succeeds in presenting the contrasts even of remote keys so immediately that they are serviceable in the opening tutti and give the form a wider range in definitely functional key than any other instrumental music. Thus in the opening tutti of the D minor concerto the second subject is announced in B flat minor. In the B flat pianoforte concerto, Op. 83, it appears in D minor, and in the double concerto, Op. 102, for violin and violoncello in A minor it appears in F major. In none of these cases is it in the key in which the solo develops it, and it is reached with a directness sharply contrasted with the symphonic deliberation with which it is approached in the solo. In the violin concerto, Op. 77, Brahms develops a counterpoint in the opposition between solo and orchestra, inasmuch as after the solo has worked out its second subject the orchestra bursts in, not with the opening ritornello, but with its own version of the material with which the solo originally entered. In other words we have now not only the development by the solo of material stated by the orchestra but also a counter-development by the orchestra of material stated by the solo. This concerto is, on the other hand, remarkable as being the last in which a blank space is left for a coda, Brahms having in his friend Joachim a kindred spirit worthy of such trust. In the piano forte concerto in B flat, and in the double concerto, Op. 102, the idea of an introductory statement in which the solo takes part before the opening tutti is carried out on a large scale, and in the double concerto both first and second subjects are thus suggested. It is unnecessary to speak of the other movements of concerto form, as the sectional structure that so easily results from the opposition between solo and orchestra is not of great disadvantage to slow movements and finales, which accordingly do not show important differences from the ordinary types of symphonic and chamber music. The scherzo, on the other hand, is normally of too small a range of contrast for successful adaptation to concerto form, and the solitary great example of its use is the second movement of Brahms's B flat pianoforte concerto.

Nothing is more easy to handle with inartistic or pseudo-classic effectiveness than the opposition between a brilliant solo player and an orchestra; and, as the inevitable tendency of even the most artistic concerto has been to exhaust the resources of the solo instrument in the increased difficulty of making a proper contrast between solo and orchestra, so the technical difficulty of concertos has steadily increased until even in classical times it was so great that the orthodox definition of a concerto is that it is "an instrumental composition designed to show the skill of an executant, and one which is almost invariably accompanied by orchestra." This idea is in flat contradiction of the role history and aesthetics of the form, which can never be understood by means of a study of averages. In art the average is always false, and the individual organization of the greatest classical works is the only sound basis for generalizations, historic or aesthetic.

CONCH (Lat. concha, Gr. κοχύς), a shell, particularly one of a mollusc; hence the term "conchology," the science which deals with such shells, more used formerly when molluscs were studied and classified according to the shell formation; the word is chiefly now used for the collection of shells (see MOLLUSCA, and such articles as GASTROPODA, MALACOSTRACA, &c.). Large spiral conchs have been from early times used as a form of trumpet, emitting a very loud sound. They are used in the West Indies and the South Sea Islands. The Tritons of ancient mythology are represented as blowing such "wreathed horns." In anatomy, the term concha or "conch" is used of the external ear, or of the hollowed central part leading to the meatus; and, in architecture, it is sometimes given to the half dome over the semicircular apse. The Romanesque work at Baalbek and Palmyra and in Renaissance building, shells are frequently carved in the heads of circular niches. A low class of the negro or other inhabitants of the Bahamas and the Florida Keys are sometimes called "Conches" or "Conks" from the shell-fish which form their staple food.

CONCHOID (Gr. κοχύς, shell, and εἴδος, form), a plane curve invented by the Greek mathematician Nicomedes, who devised a mechanical construction for it and applied it to the problem of the duplication of the cube, the construction of two mean proportional between two given quantities, and possibly to the trisection of an angle as in the 8th lemma of Archimedes. Proclus grants Nicomedes the credit of this last application, but it is disputed by Pappus, who claims that his own discovery was

1 Double and triple concertos are concertos with two or three solo players. A concerto for several solo players is called a concorbante.
original. The conchoid has been employed by later mathematicians, notably Sir Isaac Newton, in the construction of various cubic curves.

The conchoid is generated as follows:—Let O be a fixed point and BC a fixed straight line; draw any line through O intersecting BC in P and take on the line PO two points X, X', such that PX = PX' = a constant quantity. Then the locus of X and X' is the conchoid. The conchoid is also the locus of any point on a rod which is constrained to move so that it always passes through a fixed point, while a fixed point on the rod travels along a straight line. To obtain the equation to the curve, draw AO perpendicular to BC, and let AO = a; let the constant quantity PX = PX' = b. Then taking O as pole and a line through O parallel to BC as the initial line, the polar equation is $r = a \cos \theta + b$, the upper sign referring to the branch more distant from O. The cartesian equation with A as origin and BC as axis of x is $x^2 = (a-y)^2 \left( b^2 - y^2 \right)$. Both branches belong to the same curve and are included in this equation. Three forms of the curve have to be distinguished according to the ratio of a to b. If a be less than b, there will be a node at O and a loop below the initial point (curve i in the figure); if a equals b there will be a cusp at O (curve ii); if a be greater than b the curve will not pass through O, but from the cartesian equation it is obvious that O is a conjugate point (curve iii). The curve is symmetrical about the axis of y and has the axis of x for its asymptote.

**Concierge** (a French word of unknown origin; the Latinized form was concerius or concergerius), originally the guardian of a house or castle, in the middle ages a court official who was the custodian of a royal palace. In Paris, when the *Palais de la Cité* ceased about 1360 to be a royal residence and became the seat of the courts of justice, the Conciergerie was turned into a prison. In modern usage a "concierge" is a hall-porter or janitor.

**Concinus, Concio** (d. 1617), Count della Penna, Marshal d'Ancre, Italian adventurer, minister of King Louis XIII. of France, was a native of Florence. He came to France in the train of Marie de' Medici, and married the queen's lady-in-waiting, Leonora Dori, known as Galigai. The credit which his wife enjoyed with the queen, his wit, cleverness andboldness made his fortune. In 1610 he had purchased the marquisate of Ancre and the position of first gentleman-in-waiting. Then he obtained successively the governments of Amiens and of Normandy, and in 1614 the bâton of marshal. From then first minister of the realm, he abandoned the policy of Henry IV., compromised his wise legislation, allowed the treasury to be pillaged, and drew upon himself the hatred of all classes. The nobles were bitterly hostile to him, particularly Condé, with whom he negotiated the treaty of Loudun in 1616, and whom he had arrested in September 1616. This was done on the advice of Richelieu, whose introduction into politics was favoured by Concini. But Louis XIII., incited by his favourite Charles d'Albert, duc de Luynes, was tired of Concini's tutelage. The baron de Vitry received in the king's name the order to imprison him. Apprehended on the bridge of the Louvre, Concini was killed by the guards on the 24th of April 1617. Leonora was accused of sorcery and sent to the stake in the same year.

In 1767 appeared at Brescia a *De Concini vita*, by D. Sandellius. On the rôle of Concini see the *Histoire de France*, published under the direction of E. Lavisse, vol. vi. (1906), by Mariéjol.

**Conclave** (Lat. *concilium*, from *cum* together, and *clavis*, a key), strictly a room, or set of rooms, locked with a key; in this sense the word is now obsolete in English, though the *New English Dictionary* gives an example of its use so late as 1753. Its present loose application to any private or close assembly, especially ecclesiastical, is derived from its technical application to the assembly of cardinals met for the election of the pope, with which this article is concerned.

Conclave is the name applied to that system of strict election to which the electors of the pope have been and are submitted, formerly as a matter of necessity, and subsequently as the result of a legislative enactment; hence the word has come to be used of the electoral assembly of the cardinals. This system goes back only as far as the 12th century.

**Election of the Popes in Antiquity.**—The very earliest episcopal nominations, at Rome as elsewhere, seem without doubt to have been made by the direct choice of the founders of the apostolic Christian communities. But this exceptional method was replaced at an early date by that of election. At Rome the method of election was the same as in other towns: the Roman clergy and people and the neighbouring bishops each took part in it in their several capacities. The people would signify their approbation or disapprobation of the candidates more or less tumultuously, while the clergy were, strictly speaking, the electoral body, met to elect for themselves a new head, and the bishops acted as presidents of the assembly and judges of the election. The choice had to meet with general consent; but we can well imagine that in an assembly of such size, in which the candidates were acclaimed rather than elected by counting votes, the various functions were not very distinct, and that the payment of a bribe, whether clerical or lay, were found to influence the elections, and sometimes decisively. Moreover, this form of election lent itself to cabals; and these frequently gave rise to quarrels, sometimes involving bloodshed and schisms, i.e. the election of antipopes, as they were later called. Such was the case at the elections of Cornelius (251), Damasus (366), Boniface (418), Symmachus (498), Boniface II. (530) and others. The remedy for this abuse was found in having recourse, more or less freely, to the support of the civil power. The emperor Honorius upheld Boniface against his competitor Eulalius, at the same time laying down that cases of contested election should henceforth be decided by a fresh election; but this would have been a dangerous method and was consequently never applied. Theodosius upheld Symmachus against Laurentius because he had been elected first and by a greater majority. The accepted fact soon became law, and John II. recognized (532) the right of the Ostrogothic court of Ravenna to ratify the pontifical elections. Justinian succeeded to this right together with the kingdom which he had destroyed; he demanded, together with the payment of a tribute, the election of a pope of 3000 golden solidi, that the candidate elected should not receive the episcopal consecration till he had obtained the confirmation of the emperor. Hence arose long vacancies of the See, indirect interference in the elections by the imperial officials, and sometimes cases of simony and venality. This bondage became lighter in the 7th century, owing rather to the weakening of the imperial power than to any resistance on the part of the popes.

**9th to 12th Centuries.**—From the emperors of the East the power naturally passed to those of the West, and it was exercised after 842 by the descendants of Charlemagne, who claimed that the election should not proceed until the arrival of their envoys. But this did not last long; at the end of the 9th century, Rome, torn by factions, witnessed the scandal of the posthumous condemnation of Formosus. This deplorable state of affairs lasted almost without interruption till the middle of the 11th century. When the emperors were at Rome, they presided over the elections; when they were away, the rival factions of the barons, the Crescentii and the Alberici especially, struggled for the spiritual power as they did for the temporal. During this period were seen cases of popes imposed by a faction rather than elected, and then, at the mercy of sedition, deposed, poisoned and thrown into prison, sometimes to be restored by force of arms.

The influence of the Ottos (962-1002) was a lesser evil; that of the emperor Otto III. was even beneficial, in that it led to the election of Gerbert (Silvester II., in 999). But this was only a temporary check in the process of decadence, and in 1146 Clement II., the successor of the worthless Benedict IX., admitted that henceforth not only the consecration but the very election of the Roman pontiffs could only take place in presence of the
CONCLAVE

emperor. In fact, after the death of Clement II. the delegates of the Roman clergy did actually go to Polden to ask Henry III. to give them a pope, and similar steps were taken after the death of Damasus II., who reigned only twenty days. Fortunately on this occasion Henry III. appointed, just before his death, a man of high character, his cousin Bruno, bishop of Toul, who presented himself in Rome in company with Hildebrand. From this time began the reform. Hildebrand had the elections of Victor II. (1055), Stephen IX. (1057), and Nicholas II. (1058) carried out according to the canonical form, including the imperial ratification. The celebrated bull In nomine Domini of the 13th of April 1059 determined the electoral procedure; it is curious to observe how, out of respect for tradition, it preserves all the former factors in the election though their scope is modified: "In the first place, the cardinal bishops shall carefully consider the election together, then they shall consult with the cardinal clergy, and afterwards the rest of the clergy and the people shall by giving their assent confirm the new election." The election, then, is reserved to the members of the higher clergy, to the cardinals, among whom the cardinal bishops have the preponderating position. The presence of the rest of the clergy and the laity is only a formality. The same was the case of the imperial intervention, in consequence of the phrase: "Saving the honour and respect due to our dear son Henry (Henry IV.), according to the concession we have made to him, and equally to his successors, who shall receive this right personally from the Apostolic See." Thus the emperor has no right save those he has received as a concession from the Holy See. Gregory VII., it is true, notified his election to the emperor; but as he set up a series of five antipopes, none of Gregory's successors asked any more for the imperial sanction. Further, by this bull, the emperors would have to deal with the fact accompli; for it provided that, in the event of disturbances aroused by mischievous persons at Rome preventing the election from being carried out there freely and without bias, the cardinal bishops, together with a small number of the clergy and of the laity, should be empowered to go and hold the election where they should think fit; that should difficulties of any sort prevent the enthronement of the new pope, the elect pope should be empowered by the cardinals to act as if he were actually pope. This legislation was definitely a concession to the emperor by the concordat of Worms (1119).

A limited electoral body lends itself to more minute legislation than a larger body: the college for electing the pope, thus reduced so as to consist of the cardinals only, was subjected as time went on to laws of increasing severity. Two laws of great importance were established by Alexander III. at the Lateran Council of 1179. The constitution Licet de vitanda discordia makes all the cardinals equally electors, and no longer mentions the lower clergy or the people; it also requires a majority of two-thirds of the votes to decide an election. This latter provision, which still holds good, made imperial antipopes henceforth impossible.

Abuses nevertheless arose. An electoral college too small in numbers, which no higher power has the right of forcing to haste, can prolong disagreements and draw out the course of the election for a long time. It is this period during which we actually find the Hildebrandian vacancy most frequent in long spaces of time. The longest of these, however, gave an opportunity for reform and the remedy was found in the conclave, i.e. in the forced and rigid seclusion of the electors. As a matter of fact, this method had previously been used, but in a mitigated form: in 1326, on the death of Innocent III., the people of Perugia had shut up the cardinals; and in 1241 the Roman magistrates had confined them within the "Septizionum"; they took two months, however, to perform the election. Celestine IV. died after eighteen days, and this time, in spite of the seclusion of the cardinals, there was an interregnum of twenty months. After the death of Clement IV. in 1268, the cardinals, of whom seventeen were gathered together at Viterbo, allowed two years to pass without coming to an agreement; the magistrates of Viterbo again had recourse to the method of seclusion: they shut up the electors in the episcopal palace, blocking up all outlets; and since the election still delayed, the people removed the roof of the palace and allowed nothing but bread and water to be sent in. Under the pressure of famine and of this strict confinement, the cardinals finally agreed, on the 1st of September 1271, to elect Gregory X., after an interregnum of two years, nine months and two days.

Taught by experience, the new pope considered what steps could be taken to prevent the recurrence of such abuses; in 1274, at the council of Lyons, he promulgated the constitution Ubi periculum, the substance of which was as follows: At the death of the pope, the cardinals who were present are to await their absent colleagues for ten days; they are then to meet in one of the papal palaces in a closed conclave; none of them is to have to wait on him more than one servant, or two at most if he were ill; in the conclave they are to lead a life in common, not even having separate cells; they are to have no communication with the outer world, under pain of excommunication for any who should attempt it. The cardinals were supplied to the cardinals through a window which would be under watch; after three days, their meals are to consist of a single dish only; and after five days, of bread and water, with a little wine. During the conclave the cardinals are to receive no ecclesiastical revenue. No account is to be taken of those who are absent or have left the conclave. Finally, the election is to be the sole business of the conclave, and the magistrates of the town where it was held are called upon to see that these provisions be observed. Adrian V. and John XX. were weak enough to suspend the constitution Ubi periculum; but the abuses at once reappeared; the Holy See was again vacant for long periods; this further proof was therefore decisive, and Celestine V., who was elected after a vacancy of more than two years, took care, before abdicating the pontificate, to revive the constitution of Gregory X., which was inserted in the Decretals (lib. i. tit. vi., de election. cap. 3).

Since then the laws relating to the conclave have been observed, even during the great schism; the only exception was the election of Martin V., which was performed by the cardinals of the three obediences, to which the council of Constance added five prelates of each of the six nations represented in that assembly. The same was the case up to the 16th century. At this period the Italian republics, later Spain, and finally the other powers, took an intimate interest in the choice of the holder of what was a considerable political power; and each brought more or less honest means to bear, sometimes that of simony. It was against simony that Julius II. directed the bull Cum tam divino (1503), which directed that simoniacal election of the pope should be declared null; that any one could attack it; that men should withdraw themselves from the obedience of a pope thus elected; that simoniacal agreements should be invalid; that the guilty cardinals should be excommunicate till their death, and that the rest should proceed immediately to a new election. The purpose of this measure was good, but the proposed remedy extremely dangerous; it was fortunately never applied. Similarly, Paul IV. endeavoured by severe punishments to check the intriguing and plotting for election. The case of a new pope while his predecessor was still living; but the bull Cum secundum (1558) was of no effect.

Pius IV. undertook the task of reforming and completing the legislation of the conclave. The bull In eligendis (of October 1st, 1562), signed by all the cardinals, is a model of precision and wisdom. In addition to the points already stated, we may add the following: that every day there was to be a scrutiny, i.e. a solemn voting by specially prepared voting papers (concealing the name of the voter, and to be opened only in case of an election being made at that scrutiny), and that this was to be followed by the "accessit," i.e. a second voting, in which the cardinals might transfer their suffrages to those who had obtained the greatest number of votes in the first. Except in case of urgent matters, the election
was to form the whole business of the conclave. The cells were to be assigned by lot. The functionaries of the conclave were to be elected by the secret vote of the Sacred College. The most stringent measures were to be taken to ensure seclusion. The bull *Aeterni Patris* of Gregory XV. (15th of November 1621) is a collection of minute regulations. In it is the rule compelling each cardinal, before giving his vote, to take the oath that he will elect him whom he shall judge to be the most worthy; it also makes rules for the forms of voting and of the voting papers, for the counting, the scrutiny, and in fact all the processes of the election. A second bull, *Decet Romanum Pontificem*, of the 12th of March 1622, fixed the ceremonial of the conclave with such minuteness that it has not been changed since.

All previous legislation concerning the conclave was codified and renewed by Pius X.'s bull, *Vacante Sedae Apostolicae* (Dec. 25, 1904), which abrogates the earlier texts, except Leo XIII.'s constitution *Præecessores Nostri* (May 24, 1882), authorizing occasional derogations in circumstances of difficulty, e.g. the death of a pope away from Rome or an attempt to interfere with the liberty of the Sacred College. The bull of Pius X. is rather a codification than a reform, the principal change being the abolition of the scrutiny of accession and the substitution of a second ordinary scrutiny during the same session.

On some occasions exceptional circumstances have given rise to transitory measures. In 1797 and 1798 Pius VI. authorized the cardinals to act contrary to such of the laws concerning the conclave as a majority of them should decide not to observe, as being impossible in practice. Similarly Pius IX., by means of various acts which remained secret up till 1892, had taken the most minute precautions in order to secure a free and rapid election, and to avoid all interference on the part of the secular powers. We know that the conclaves in which Leo XIII. and Pius X. were elected enjoyed the most complete liberty, and the hypothetical measures foreseen by Pius IX. were not applied. Until after the Great Schism the conclaves were held in various towns outside of Rome; but since then they have all been held in Rome, with the single exception of the conclave of Venice (1600), and in most cases in the Vatican.

There was no place permanently established for the purpose, but removable wooden cells were installed in the various apartments of the palace, grouped around the Sistine chapel, in which the scrutinies took place. The arrangements prepared in the Quirinal in 1823 did duty only three times, and for the most recent conclaves it was necessary to arrange an inner enclosure within the vast but irregular palace of the Vatican. Each cardinal is accompanied by a clerk or secretary, known for this reason as a conclavist, and by one servant only. With the officials of the conclave, this makes about two hundred and fifty persons who enter the conclave and have no further communication with the outer world save by means of turning-boxes. Since 1870 the solemn ceremonies of earlier times have naturally not been seen; for instance the procession which used to celebrate the entry into conclave; or the daily arrival in procession of the clergy and the brotherhoods to enquire the *Rota*; "Habemus Papam?" and their return accompanied by the chanting of the "Veni Creator"; or the "Marshall of the Holy Roman Church and perpetual guardian of the conclave" visiting the churches in state. But a crowd still collects morning and evening in the great square of St. Peter's, towards the time of the completion of the vote, to look for the smoke which rises from the burning of the voting-papers after each session; when the election has not been effected, a little straw is burnt with the papers, and the column of smoke then apprises the spectators that they have still no pope. Within the conclave, the cardinals, alone in the common hall, usually the Sistine chapel, proceed morning and evening to their double vote, the direct vote and the "accessit." Sometimes these sessions have been very numerous; for example, in 1740, Benedict XIV. was only elected after 255 scrutinies; on other occasions, however, and notably in the case of the last few popes, a well-defined majority has soon been evident, and there have been but few scrutinies. Each vote is immediately counted by three scrutators, appointed in rotation, the most minute precautions being taken to ensure that the voting shall be secret and sincere. When one cardinal has at last obtained two-thirds of the votes, the dean of the cardinals formally asks him whether he accepts his election, and what name he wishes to assume. As soon as he has accepted, the first "obedience" or "adoration" takes place, and immediately after the first cardinal deacon goes to the *Loggia* of St Peter's and announces the great news to the assembled people. The conclave is dissolved; on the following day take place the two other "obediences," and the election is officially announced to the various governments. If the pope be not a bishop (Gregory XVI. was not), he is then consecrated; and finally, a few days after his election, takes place the coronation, from which the pontificate is officially dated. The pope then receives the tiara with the triple crown, the sign of his supreme spiritual authority. The ceremony of the coronation goes back to the 9th century, and the tiara, in the form of a high conical cap, is usually ancient (*see* Tiara).

In conclusion, a few words should be said with regard to the right of veto. In the 16th and 17th centuries the character of the conclaves was determined by the influence of what were then known as the "factions," i.e. the formation of the cardinals into groups according to their nationality or their relations with one of the Catholic courts of Spain, France or the Empire, or again according as they favoured the political policy of the late pope or his predecessor. These groups upheld or opposed certain candidates. The Catholic courts naturally entrusted the cardinals "of the crown," i.e. those of their nation, with the mission of removing, as far as lay in their power, candidates who were distasteful to their party; the various governments could even make public their desire to exclude certain candidates. But they soon claimed an actual right of formal and direct exclusion, which should be notified in the conclave in their name by a cardinal charged with this mission, and which should have a decisive effect; this is what has been called the right of veto. We cannot say precisely at what time during the 16th century this transformation of the practice into a right, tacitly accepted by the Sacred College, took place; it was doubtless felt to be less dangerous formally to recognize the right of the three sovereigns each to object to one candidate, than to face the inconvenience of objections, such as were formulated on several occasions by Philip II., which, though less legal in form, might apply to an indefinite number of candidates. The fact remains, however, that it was a right based on custom, and was not supported by any text or written concession; but the diplomatic right was straightforward and definite, and was better than the intrigues of former days. During the 19th century Austria exercised, or tried to exercise, the right of veto at all the conclaves, except that which elected Leo XIII. (1878); it did so again at the conclave of 1903. On the 2nd of August Cardinal Rampolla had received twenty-nine votes, when Cardinal Kolzisko-Puizna, bishop of Cracow, declared that the Austrian government opposed the election of Cardinal Rampolla; the Sacred College considered that it ought to yield, and on the 4th of August elected Cardinal Sarto, who took the name of Pius X. By the bull *Commissum Nobis* (January 20, 1904), Pius X. suppressed all right of "veto" or "exclusion" on the part of the secular governments, and forbade, under pain of excommunication reserved to the future pope, any cardinal or clavist to accept from his government the charge of proposing a "veto," or to exhibit it to the conclave under any form.

---

**CONCLAVE**

829
CONCORD, the capital of New Hampshire, U.S.A., and the county-seat of Merrimack county, on both sides of the Merrimack river, about 75 m. N.W. of Boston, Massachusetts. Pop. (1900) 17,004; (1905) 19,632, of whom 3813 were foreign-born; (1910, U.S. census) 21,407. Concord is served by the Boston & Maine railway. The area of the city in 1905 was 45½ sq. m. Concord has broad streets bordered with shade trees; and has several parks, including Penacook, White, Rollins and the Contoocook river. Among the principal buildings are the state capitol, the state library, the city hall, the county court-house, the post-office, a public library (17,000 vols.), the state hospital, the state prison, the Centennial home for the aged, the Margaret Pillsbury memorial hospital, the Rolfe anti-Rumford asylum for orphan girls, founded by Count Rumford's daughter, and some fine churches, including the Christian Science church built by Mrs Eddy. There are a soldiers' memorial arch, a statue of Daniel Webster by Thomas Ball, and statues of John P. Hale, John Stark, and Commodore George H. Perkins, the last by Daniel C. French; and at Penacook, 6 m. N.W. of Concord, there is a monument to Hannah Dustin (see Haverhill). Among the educational institutions are the well-known St Paul's school for boys (Protestant Episcopal, 1853), about 2 m. W. of the city, and St Mary's school for girls (Protestant Episcopal, 1885). From 1847 to 1867 Concord was the seat of the Biblical Institute (now known as the Concord Seminary) founded in Newbury, Vermont, in 1841, and restored to Boston by the Theodore Perkins family in 1867, and after 1871 a part of Boston University. The city has various manufactures, including flour and grind mill products, silver ware, cotton and woolen goods, carriages, harnesses and leather belting, furniture, wooden ware, pianos and clothing; the Boston & Maine Rail Road has a large repair shop in the city, and there are valuable granite quarries in the vicinity. In 1905 Concord ranked third among the cities of the state in the value of its factory products, which was $6,387,372, being an increase of 51.7% since 1900. When first visited by the English settlers, the site of Concord was occupied by Penacook Indians; a trading post was built here about 1660. In 1725 Massachusetts granted the land in this vicinity to some of her citizens; but this grant was not recognized by New Hampshire, whose legislature issued (1727) a grant (the Township of Bow) overlapping the Massachusetts grant, which was known as Penacook or Penny Cook. The New Hampshire grantees undertook to establish here a colony of Londonderry Irish; but the Massachusetts settlers were firmly established by the spring of 1727, Massachusetts definitely assumed jurisdiction in 1731, and in 1742 her general court incorporated this settlement under the name of Rumford. The conflicting rights of Rumford and Bow gave rise to one of the most celebrated of colonial land cases, and although the New Hampshire authorities enforced their claims of jurisdiction, the privy council in 1755 confirmed the Rumford settlers in their possession. In 1765 the name was changed to the "parish of Concord," and in 1784 the town of Concord was incorporated. Here, for some years before the War of American Independence, lived Benjamin Thompson, later Count Rumford. In 1778 and again in 1781-1782 a state constitutional convention met here; the first New Hampshire legislature met at Concord in 1782; the convention which ratified for New Hampshire the Federal Constitution met here in 1788; and in 1808 the state capital was definitely established here. The New Hampshire Patriot, founded here in 1808 (and for twenty years edited) by Isaac Hill (1778-1851), who was a member of the United States Senate in 1831-1836, and governor of New Hampshire in 1836-1839, became one of the leading exponents of Jacksonian Democracy in New England. In 1814 the Middlesex Canal, connecting Concord with Boston, was completed. A city charter granted by the legislature in 1849 was not accepted by the city until 1853.

See J. O. Lyford, The History of Concord, New Hampshire (City History Commission) (2 vols., Concord, 1903); Concord Town Records, 1732-1820 (Concord, 1894); J. B. Moore, Annals of Concord, 1720-1823 (Concord, 1824); and Nathaniel Boutron, The History of Concord (Concord, 1856).
CONCORD, BOOK OF—CONCORDANCE

CONCORD, BOOK OF (Liber Concordiae), the collective documents of the Lutheran confession, consisting of the Confessio Augustana, the Apología Confessiónis Augustanarúm, the Articulæ Sinodaliciæ, the Catechismi Major et Minor and the Formula Concordiæ. The latter was a formula issued on the 25th of June 1580 (the jubilee of the Augsburg Confession) by the Lutheran Church in an attempt to heal the breach which, since the death of Luther, had been widening between the extreme Lutherans and the Crypto-Calvinists. Previous attempts at concord had been made at the request of different rulers, especially by Jacob Andréi with his Swabian Concordia in 1573, and Abel Scheringer with the Maulbronn Formula in 1575. In 1576 the elector of Saxony called a conference of theologians at Torgau to discuss these two efforts and from them produce a third. The Book of Torgau was evolved, circulated and criticized; a new committee, prominent on which was Martin Chemnitz, sitting at Bergen near Magdeburg, considered the criticisms and finally drew up the Formula Concordiæ. It consists of (a) the "Epitome," (b) the "Solid Repetition and Declaration," each part comprising twelve articles; and was accepted by Saxony, Württemberg, Baden among other states, but rejected by Hesse, Nassau and Holstein. By a decree of John of Saxony divided, Hamburg and Lübeck for, Bremen and Frankfort against. Hungary and Sweden accepted it, and so finally did Denmark, where at first it was rejected, and its publication made a crime punishable by death. In spite of this very limited reception the Formula Concordiæ has always been reckoned with the five other documents as of confessional authority. See P. Schaff, Creeds of Christendom, i. 258-340, iii. 92-180.

CONCORDANCE (Late Lat. concordantia, harmony, from cum, with, and cor, heart), literally agreement, harmony; hence derivatively a citation of parallel passages, and specifically an alphabetical arrangement of the words contained in a book with citations of the passages in which they occur. Concordances in this last sense were first made for the Bible. Originally the word was only used in this connexion in the plural concordantiae, each group of parallel passages being properly a concordantia. The Germans distinguish between concordances of things and concordances of words, the former indexing the subject-matter of a book ("real" concordance), the latter the words ("verbal" concordance).

The original impetus to the making of concordances was due to the conviction that the several parts of the Bible are consistent with each other, as parts of a divine revelation, and may be combined as harmonious elements in one system of spiritual truth. To Anthony of Padua (1165-1231) ancient tradition ascribes the first concordance, the anonymous Concordantiae Morales, of which the basis was the Vulgate. The first authentic work of the kind was due to Cardinal Hugh of St Ché, a Dominican monk (d. 1263), who, in preparing for a commentary on the Scriptures, found the need of a concordance, and is reported to have used for the purpose the services of five of his brother monks. This concordance was the basis of two which succeeded in time and importance, one by Conrad of Halberstadt (f. 1080-1160) and the other by John of Stwoman (d. 1300). This book was published in a greatly improved and amplified form in the middle of the 15th century by David Nutt, of London, edited by T. P. Dutronp. The first Hebrew concordance was compiled in 1437-1445 by Rabbi Isaac Nathan b. Kalonymus of Arles. It was printed at Venice in 1523 by Daniel Bomberg, in Basel in 1556, 1569, and 1591. It was published under the title Mein Nabi, "The Light of the Way." In 1556 it was translated into Latin by Johann Reuchlin, but many errors appeared in both the Hebrew and the Latin editions. These were corrected by Marius de Calasio, a Franciscan friar, who published a four volume folio Concordantiae Sacr. Bibl. Hebr. et Latin. at Rome, 1621, much enlarged, with proper names included. Another concordance based on Nathan's was Johann Buxtorf the elder's Concordantiae Bibl. Ebraicae nova et artificiosa methodo dispositae, Basel, 1632. It marks a stage in both the arrangement and the knowledge of the roots of words, but can only be used by those who know the massoretic system, as the references are made by Hebrew letters and relate to rabbinical divisions of the Old Testament. Calasio's concordance was republished in London under the direction of William Romaine in 1747-1749, in four volumes folio, under the patronage of all the monarchs of Europe and also of the pope. In 1754 John Taylor, D.D., a Presbyterian divine in Norwich, published in two volumes the Hebrew Concordance adapted to the English Bible, disposed after the manner of Buxtorf. This was the most complete and convenient concordance up to the date of its publication. In the middle of the 19th century Dr Julius Furst issued a thoroughly revised edition of Buxtorf's concordance. The Hebratischen und chaldäischen Concordz zu den Heiligen Schriften Alten Testaments (Leipzig, 1840) carried forward the development of the concordance in several directions. It gave (1) a corrected text founded on Hahn's Vanderhoogt's Bible; (2) the Rabbinical meanings; (3) explanations in Latin, and illustrations from the three Greek versions, the Aramaic paraphrase, and the Vulgate; (4) the Greek words employed by the Septuagint as renderings of the Hebrew; (5) information on philology and chaldaic lexicography, so that the concordance contained a Hebrew lexicon. An English translation by Dr Samuel Davidson was published in 1867. A revised edition of Buxtorf's work with additions from Furst's was published by B. Bär (Stettin, 1862). A new concordance embodying the matter of all previous works with lists of proper names and particles was published by Solomon Mandelkern in Leipzig (1866); a smaller edition of the same, without quotations, appeared in 1900. There are also concordances of Biblical proper names by G. Brecher (Frankfort-on-Main, 1876) and Schusslovicz (Wilna, 1878).

A Concordance to the Septuagint was published at Frankfort in 1602 by Conrad Kircher of Augsburg; in this the Hebrew words are placed in alphabetical order and the Greek words by which they are translated are placed under them. A Septuagint concordance, giving the Greek words in alphabetical order, was published in 1718 in two volumes by Abraham Tromn, a learned minister at Groningen, then in the eighty-fourth year of his age: It gives the Greek words in alphabetical order; a Latin translation; the Hebrew word or words for which the Greek term is used; a list of passages where the words occur in the order of the books and chapters; at the end of the quotations from the Septuagint places are given where the word occurs in Aquila, Symmachus and Theodotion, the other Greek translations of the O. T.; and the words of the Apocrypha follow in each case. Besides an index to the Hebrew and Chaldaic words there is another index which contains a lexicon to the Hexapla of Origen. In 1887 (London) appeared the Handy Concordance of the Septuagint giving various readings from Codices Vaticanus, Alexandrinus, Sinaiticus and Ephraemi, with an appendix of words from Origen's Hexapla, not found in the above manuscripts, by G. M., without quotations. A work of the best modern scholarship was brought out in 1897 by the Clarendon Press, Oxford, entitled A Concordance to the Septuagint and the other Greek versions of the Old Testament including the Apocryphal Books, by Edwin Hatch and H. R. Redpath, assisted by other scholars; this was completed in 1900 by a list of proper names.

The first Greek concordance to the New Testament was published at Basel in 1546 by Sixt Birck or Xystus Betulesius (1500-1554), a philologist and minister of the Lutheran Church. This was followed by Stephen's concordance (1594) planned by Robert Stephens and published by Henry, his son. Then in 1638 came Schmid's ρωμοιος, which has been the basis of subsequent concordances to the New Testament. Erasmus Schmid or Smid was a Lutheran divine who was professor of Greek in Wittenberg, where he died in 1637. Revised editions of the ρωμοιος were published at Gotha in 1717, and at Glasgow in 1839 by the University Press. In the middle of the 19th century Charles Hermann Bruder brought out a beautiful edition (Tauch-Nitz) with many improvements. The apparatus criticus was a triumph of New Testament scholarship. It collates the readings of Erasmus, R. Stephens' third edition, the Eisevirs, Mill, Bengel, Webster, Knapp, Tittman, Scholz, Lachmann. It also
gives a selection from the most ancient patristic MSS. and from various interpreters. No various reading of critical value is omitted. An edition of Bruder with readings of Samuel Prideaux Trelgell was published in 1888 under the editorship of Westcott and Hort. The Englishman's Greek Concordance of the New Testament, and the Englishman's Hebrew and Chaldee Concordance, are books intended to put the results of the above-mentioned works at the service of those who know little Hebrew or Greek. Every word in the Greek is given in Hebrew or Greek, the word is transliterated, and then every passage in which it occurs is given—the word, however it may be translated, being italicized. They are the work of George V. Wigram assisted by W. Brugh and superintended by S. P. Trelgell, J. W. Davidson and W. Chalk (1843; 2nd ed. 1860). Another book which deserves mention is, A Concordance to the Greek Testament with the English version to each word; the principal Hebrew roots corresponding to the Greek words of the Septuagint, with short critical notes and an index, by John Williams, LL.D., Lond. 1767.

In 1884 Robert Young, author of an analytical concordance mentioned above, brought out a Concordance to the Greek New Testament with a Dictionary of Bible Words and Synonyms: this contains a concise concordance to eight thousand changes made in the Revised Testament. Another important work of modern scholarship is the Concordance to the Greek Testament, edited by the Rev. W. F. Moulton and A. E. Geden, according to the texts adopted by Westcott and Hort, Tischendorf, and the English revisers.

The first concordance to the English version of the New Testament was published in London, 1535, by Thomas Gysbunson. It is a black-letter volume entitled The Concordance of the New Testament most necessary to be had in the hands of all such as delight in the communication of any place contained in ye New Testament.

The first English concordance of the entire Bible was John Marbeck's, A Concordance, that is, a work wherein by the order of the English Bible, the Holy Scriptures, is contained, in the whole Bible, so often as it is there expressed or mentioned, Lond. 1539. Although Robert Stephens had divided the Bible into verses in 1545, Marbeck does not seem to have known this and refers to the chapters only. In 1550 also appeared Walter Luyne's translation of the concordance issued by Bullinger, Jude, Pellican and others of the Reformers. Other English concordances were published by Cotton, Newman, and in abbreviated forms by John Downham or Downname (ed. 1652), Vavasor Powell (1617-1670), Jackson and Samuel Clarke (1626-1701).

In 1737 Alexander Cruden (q.v.), a London bookseller, born and educated in Aberdeen, published his Complete Concordance to the Holy Scriptures of the Old and New Testament, to which is added a concordance to the books called Apocrypha. This book embodied, was based upon, and superseded all its predecessors. Though the first edition was not remunerative, three editions were published during Cruden's life, and many since his death. Cruden's work is in two parts and full, and later concordances only supersede his by combining an English with a Greek and Hebrew concordance. This is done by the Critical Greek and English Concordance prepared by C. F. Hudson, H. A. Hastings and Ezra Abbot, LL.D., published in Boston, Mass., and by the Critical Lexicon and Concordance to the English and Greek New Testament, by E. L. Bullinger, 1892. The Interpreting Concordance to the New Testament, edited by James Gall, shows the Greek original of every word, with a glossary explaining the Greek words of the New Testament, and showing their varied renderings in the Authorized Version. The most convenient of these is Young's Analytical Concordance, published in Edinburgh in 1879, and since revised and reissued. It shows (1) the original Hebrew or Greek of any word in the English Bible; (2) the literal and primitive meaning of every such original word; (3) thoroughly reliable parallel passages. There is a Student's Concordance to the Revised Version of the New Testament showing the changes embodied in the revision, published under licence of the universities; and a concordance to the Revised Version by J. A. Thoms for the Christian Knowledge Society.

Biblical concordances having familiarized students with the value and use of such books for the systematic study of an author, the practice of making concordances has now become common. There are concordances to the works of Shakespeare, Browning and many other writers.

CONCORDAT (Lat. concordatium, agreed upon, from com-, together, and cor-, heart), a term originally denoting an agreement between ecclesiastical persons or secular persons, but later applied to a pact concluded between the ecclesiastical authority and the secular authority on ecclesiastical matters which concern both, and, more specially, to a pact concluded between the pope, as head of the Catholic Church, and a temporal sovereign for the regulation of ecclesiastical affairs in the territory of such sovereign. It is to concordates in this later sense that this article refers.

No one now questions the profound distinction that exists between the two powers, spiritual and temporal, between the church and the state. Yet these two societies are none the less in inevitable relation. The same men go to compose both; and the church, albeit pursuing a spiritual end, cannot dispense with the aid of temporal property, which in its nature depends on the organization of secular society. It follows of necessity that there are some matters which may be called "mixed," and which are the legitimate concern of the two powers, such as church property, places of worship, the appointment and the emoluments of ecclesiastical dignitaries, the temporal rights and privileges of the secular and regular clergy, the regulation of public worship, and the like. The existence of such mixed matters gives rise to inevitable conflicts of jurisdiction, which may lead, and sometimes have led, to civil war. It is, therefore, to the general interest that all these matters should be settled pacifically, by a common accord; and hence originated those conventions between the two powers which are known by the significant name of concordat, the official name being pactum missorium or solemnis concordiae. In theory these agreements may result from the spontaneous and pacific initiative of the contracting parties, but in reality their object has almost always been to terminate more or less acute conflicts and remedy more or less disturbed situations. It is for this reason that concordates always present a clearly marked character of mutual concession, each of the two powers renouncing certain of its claims in the interests of peace.

For the purposes of a concordat the state recognizes the official status of the church and of its ministers and tribunals; guarantees it certain privileges; and sometimes binds itself to secure for it subsidies representing compensation for past spoliations. The pope on his side grants the temporal sovereign certain rights, such as that of making or controlling the appointment of dignitaries; engages to proceed in harmony with the government in the creation of dioceses or parishes; and regularizes the situation produced by the usurpation of church property by the state. Thus the great advantage of concordates—indeed their principal utility—consists in transforming necessarily unequal unilateral claims into contractual obligations analogous to those which result from an international convention. Whatever the obligations of the state towards the ecclesiastical society may be in pure theory, in practice they become more precise and stable when they assume the nature of a bilateral convention by which the state engages itself with regard to a third party. And reciprocally, whatever may be the absolute rights of the ecclesiastical society over the appointment of its dignitaries, the administration of its property, and the government of its adherents, the exercise of these rights is limited and restricted by the stable engagements and concessions of the concordatory pact, which bind the head of the church with regard to the nations.

A concordat may assume diverse forms,—historically, three. The most common in modern times is that of a diplomatic convention debated between the authorized mandatories of the high contracting parties and subsequently ratified by the latter; as, for example, the French concordat of 1801. Or, secondly, the concordat may result from two identical separate
acts, one emanating from the pope and the other from the sovereign; this was the form of the first true concordat, that of Worms in 1212. A third form was employed in the case of the concordat of 1516 between Leo X. and Francis I. of France; a papal bull published the concordat in the form of a concession by the pope, and it was afterwards accepted and published by the king as law of the country. The shades which distinguish these three forms are not without significance, but they in no way detract from the contractual character of concordats.

Since concordats are contracts they give rise to that special mutual obligation which results from every agreement freely entered into; for a contract is binding on both parties to it. Concordats are undoubtedly conventions of a particular nature. They may make certain concessions or privileges once given without any corresponding obligation; they constitute for a given country a special ecclesiastical law; and it is thus that writers have sometimes spoken of concordats as privileges. Again, it is quite certain that the spiritual matters upon which concordats bear do not concern the two powers in the same manner and in the same degree; and in this sense concordats are not perfectly equal agreements. Finally, they do not assume the contracting parties to be totally independent, i.e. regard is had to the existence of anterior rights or duties. But with these reservations it must unhesitatingly be said that concordats are bilateral or symmetricalic contracts, from which results an equal mutual obligation for the two parties, who enter into a juridical engagement towards each other. Latterly certain Catholics have questioned this equality of the concordatary obligation, and have aroused keen discussion. According to Maurice de Bonald (Deux questions sur le concordat de 1801, Geneva, 1871), who exaggerates the view of Cardinal Tarquini (Instit. juris publ. ecli., 1862 and 1868), concordats would be pure privileges granted by the pope; the pope would not be able to enter into agreements on spiritual matters or impose restrictions on the power of his successors; and consequently he would not bind himself in any juridical sense and would be able freely to revoke concordats, just as the author of a privilege can withdraw it at his pleasure. This exaggerated argument found a certain number of supporters, several of whom nevertheless weakened it. But the best canonists, from the Roman professor De Angolis (Procli juris canon. i. 106) onwards, and all jurists, have victoriously refuted this theory, either by insisting on the principles common to all agreements or by citing the formal text of several concordats and papal acts, which are as explicit as possible. They have thus upheld the true contractual nature of concordats and the mutual juridical obligation which results from them.

The foregoing statements must not be taken to mean that concordats are in their nature perpetual, and that they cannot be broken or denounced. They have the perpetuity of conventions which contain no time limitation; but, like every human convention, they can be denounced, in the form in use for international treaties, and for good reasons, which are summed up in the exigencies of the general good of the country. Nevertheless, there is no example of a concordat having been denounced or broken by the popes, whereas several have been denounced or broken by the civil powers, sometimes in the least diplomatic manner, as in the case of the French concordat in 1905. The rupture of the concordat at once terminates the obligations which resulted from it on both sides; but it does not break off all relation between the church and the state, since the two societies continue to coexist on the same territory. To the situation defined by concordat, however, succeeds another situation, more or less uncertain and more or less strained, in which the two powers legislate separately on mixed matters, sometimes not without provoking conflicts.

We cannot describe in detail the objects of concordatary conventions. They bear upon very varied matters, and we must confine ourselves here to a brief résumé. In the first place is the official recognition by the state of the Catholic religion and its ministers. Sometimes the Catholic religion is declared to be the state religion, and at least the free and public exercise of its worship is guaranteed. Several conventions guarantee the free communication of the bishops, clergy and laity with the Holy See; and this admits of the publication and execution of apostolic letters in matters spiritual. Others define those affairs of major importance which may be or must be referred to the Holy See by appeal, or the decision of which is reserved to the Holy See. On several occasions concordats have established a new division of dioceses, and provided that future erections or divisions should be made by a common accord. Analogous provisions have been made with regard to the territorial divisions within the dioceses; parishes have been recast, and the consent of the two authorities has been required for the establishment of new parishes. As regards candidates for ecclesiastical offices, the concordats concluded with Catholic nations regularly give the sovereign the right to nominate or present to bishoprics, often also to other church benefices, such as canonsries, important parishes and abbeys; or at least the choice of the ecclesiastical authority is submitted to the approval of the civil power. In all cases canonical institution (which confers ecclesiastical jurisdiction) is reserved to the pope or the bishops. In countries where the head of the state is not a Catholic, the bishops are regularly elected by the chapters, but the civil power has the right to strike out objectionable names from the list of candidates which is previously submitted to it. Other conventions secure the exercise of the jurisdiction of the bishops in their diocese, and determine precisely their authority over seminaries and other ecclesiastical establishments of instruction and education, as well as over public schools, so far as concerns the teaching of religion. Certain concordats deal with the orders and congregations of monks and nuns with a view to subjecting them to a certain control while securing to them the legal exercise of their functions. Some concordats define the boundaries of ecclesiastical immunities, such as reservation of the criminal cases of the clergy, the religious right to the revenue of the offices, service and other privileges, are expressly maintained in a certain number of parts. One of the most important subjects is that of church property. An agreement is come to as to the conditions on which pious foundations are able to be made; the measure in which church property shall contribute to the public expenses is indicated; and, in the 19th century, the position of those who have acquired confiscated church property is regularized. In exchange for this surrender by the church of its ancient property the state engages to contribute to the subsistence of the ministers of public worship, or at least of certain of them.

Scholars agree in associating the earliest concordats with the celebrated contest about investitures (q.v.), which so profoundly agitated Christian Europe in the 11th and 12th centuries. The first in date is that which was concluded for England with Henry I. in 1107 by the efforts of St Anselm. The convention of Sutri of 1111 between the pope Paschal II. and the emperor Henry V. having been rejected, negotiations were resumed by Pope Calixtus II. and ended in the concordat of Worms (1122), which was confirmed in 1177 by the convention between Alexander III. and the emperor Frederick I. In this concordat a distinction was made between spiritual investiture, by the ring and pastoral staff, and lay or feudal investiture, by the sceptre. The emperor renounced investiture by ring and staff, and permitted canonical elections; the pope on his part recognized the king’s right to perform lay investiture and to assist at elections. Analogous to this convention was the concordat concluded between Nicholas IV. and the king of Portugal in 1289.

The lengthy discussions on ecclesiastical benefits in Germany ended finally in the concordat of Vienna, promulgated by Nicholas V. in 1448. Already at the council of Constance attempts had been made to reduce the excessive papal reservation of their activities in the matter of benefices, privileges which had been established under the Avignon popes and during the Great Schism; for example, Martin V. had had to make with the different nations special arrangements which were valid for five years only, and by which he renounced the revenues of vacant benefices. The council of Basel went further: it suppressed

---

1 These are arranged under thirty-five distinct heads in Nussi’s Quinquaginta conventiones de rebus ecclesiasticis (Rome, 1899).
CONCORDIA

annates and all the benefice reservations which did not appear in the Corpus Juris. Eugenius IV., repudiated the Basel decrees, and the negotiations terminated in what was called the "concordat of the princes," which was accepted by Eugenius IV. on his death-bed (bulls of February 5 and 7, 1447). In February 1448 Nicholas V. concluded the arrangement, which took the name of the concordat of Vienna. This concordat, however, was not received as law of the Empire. In Germany the concessions made to the pope and the reservations maintained by him in the matter of taxes and benefices were deemed excessive, and the prolonged discontent which resulted was one of the causes of the success of the Lutheran Reformation.

In France the opposition to the papal exactions had been still more marked. In 1438 the Pragmatic Sanction of Bourges adopted and put into practice the Basel decrees, and in spite of the incessant protests of the Holy See the Pragmatic was observed throughout the 15th century, even after its nominal aboli- tion by Louis XI. In 1461. The situation was modified by the concordat of Bologna, which was personally negotiated by Leo X. and Francis I. of France at Bologna in December 1515, inserted in the bull Primae (August 15, 1516), and promulgated as law of the realm in 1517, but not without rousing keen opposition. All bishops, abbots and priories were in the royal nomination, the canonical institution belonging to the pope. The pope preserved the right to nominate to vacant benefices in curia and to certain benefices of the chapters, but all the others were in the nomination of the bishops or other inferior collators. However, the exercise of the pope's right of provision still left considerable scope for papal intervention, and the pope retained the annates.

In the 17th century we have only to mention the concordat between Urban VIII. and the emperor Ferdinand II. for Bohemia in 1640. In the 18th century concordats are numerous; there are two for Spain, in 1737 and 1753; two for the duchy of Milan, in 1757 and 1784; one for Poland, in 1756; five for Sardinia and Piedmont, in 1727, 1741, 1742, 1750 and 1770; and one for the kingdom of the Two Sicilies in 1741.

After the political and territorial upheavals which marked the end of the 18th century and the beginning of the 19th, all these concordats either fell to the ground or had to be reaccessed. In the 19th century we find a long series of concordats, of which a good number are still in force. The first in date and importance is that of 1801, concluded for France between Napoleon, First Consul, and Pius VII. after laborious negotiations. Save in the provisions relating to ecclesiastical benefices, all the property of which had been confiscated, it reproduced the concordat of 1516. The pope conditioned those who had acquired church property; and by way of compensation the government engaged to give the bishops and cures suitable salaries. The concordat was solemnly promulgated on Easter Day 1802, but the government had added to it unilateral provisions of Gallican tendencies, which were known as the Organic Articles. After having been the law of the Church of France for a century, it was denounced by the French government in 1905. It remains, however, partly in force for Belgium and Alsace-Lorraine, which formed part of French territory in 1801.

We conclude with a brief chronological survey of the concordats during the 19th century, some now abrogated or replaced, others maintained. It must be observed that the denunciation of a concordat by a nation does not necessarily entail the separation of the church and the state in that country or the rupture of diplomatic relations with Rome.

1803. For the Italian republic, between Napoleon and Pius VII., analogous to the French concordat; abrogated.

1813. It is impossible to designate as a concordat the concessions which were wrested by violence from Pius VII. when ill and in seclusion at Fontainebleau, and which he at once retracted.

1817. For Bavaria; still in force.

1817. New French concordat, in which Louis XVIII. endeavoured to revive the concordat of 1516; but it was not put to the vote in the chambers, and never came into force.

1817. For Piedmont, completed in 1836 and 1841; was suppressed, like all other Italian concordats, by the formation of the kingdom of Italy.

1818. For the Two Sicilies, completed in 1834; lasted until the invasion of the kingdom of Naples by Piedmont.

1821. For Prussia; still in force.

1821. For the Rhine provinces not incorporated in Prussia, with the special object of regulating episcopal elections; concerned Wurttemberg, Baden, Hesse, Saxony, Nassau, Frankfort, the Hanseatic towns, Oldenburg and Waldeck. This first concordat was immediately suspended, and was not ratified until 1827; it is partially maintained. It had to be replaced by new concordats concluded with Wurttemberg in 1857 and the grand-duchy of Baden in 1859; but these conventions, not having been ratified by those countries, never came into force.

1824. For the kingdom of Hanover; maintained.

1827. For Belgium and Holland; abandoned by a common accord.

1828 and 1845. For Switzerland, for the reorganization of the bishoprics of Basel and Solothurn; in force.

1847. For Russia, never applied by Russia. It was followed by various partial conventions.

1851. For Tuscany; lasted until the formation of the kingdom of Italy.

1851. For Spain, completed in 1859 and 1888; in force.

A convention on the religious orders was concluded in 1904, but had not received the assent of the Senate in 1908.

1875. For Austria; denounced in 1870. Several of its provisions are maintained by unilateral Austrian laws. The emperor of Austria continues to nominate to bishoprics by virtue of rights anterior to this concordat.

1857. For Portugal, completed in 1888 for the Portuguese possessions in the Indies; in force.

1886. For Montenegro; in force.

The numerous concordats concluded towards the middle of the 19th century with several of the South American republics either have not come into force or have been denounced and replaced by a more or less pacific modus vivendi.

For texts see Vincenzo Nesi, Quinquaginta conventioane de rebus ecclesiasticis (Rome, 1869); Mainz, 1870; Branden, Concordat inter S. Sedem et indicum nationem Germaniam, &c. (undated). On the nature and obligation of concordats see Mgr. Giobbio, I Concordati (Monza, 1900); idem, Lezioni di diplomazia ecclesiastica (Rome, 1890); Cardinal Cavigna, Instruzioni juri publici ecclesiastici (Rome, 1906). For the French concordats see A. Baudrillard, Quatre cents ans de concordat (Paris, 1905); Boulay de la Meurthe, Documents sur la negociation du concordat et sur les autres rappports de la France avec le Saint-Siege (Paris, 1893-1903); Cardinal Mainardi, Le Concordato di Roma (Siena, 1903); F. Sevestre, Le Concordat de 1801, l'histoire, le texte, la destine (Paris, 1905). On the relations between the church and the state in various countries see Verin, Kirchenrecht, §§ 30-53. (A. Bo.)

CONCORDIA, a Roman goddess, the personification of peace and goodwill. Several temples in her honour were erected at Rome, the most ancient being one on the Capitol, dedicated to her by Camillus (367 B.C.), subsequently restored by Livia, the wife of Augustus, and consecrated by Tiberius (A.D. 10). Other temples were frequently built to commemorate the restoration of civil harmony. Offerings were made to Concordia on the birthdays of emperors, and Concordia Augusta was worshipped as the protector of harmony in the imperial household. Concordia was represented as a matron holding in her right hand a potera or an olive branch, and in her left a cornu copiae or a sceptre. Her symbols were two hands joined together, and two serpents entwined about a herald's staff.

CONCORDIA (mod. Concordia Sagittaria), an ancient town of Venetia, in Italy, 16 ft. above sea-level, 31 m. W. of Aquileia, at the junction of roads to Altimum and Patavium, to Opitergium (and thence either to Vicetia and Verona, or Feltria and Tridium), to Noricum by the valley of the Vilaventu (Tagliamento), and to Aquileia. It was a mere village until the time of Augustus, who made it a colony. Under the later empire it was one of the most important towns of Italy; it had a strong garrison and a factory of missiles for the army. The cemetery of the garrison has been excavated since 1873, and a large number of important
inscriptions, the majority belonging to the end of the 4th and the beginning of the 5th centuries, have been discovered. It was taken and destroyed by Attila in A.D. 452. Considerable remains of the ancient town have been found—parts of the city walls, the sites of the forum and the theatre, and probably that of the arms factory. The objects found are preserved at Portogruaro, 1 ½ m. to the N. The see of Concordia was founded at an early period, and transferred in 339 to Portogruaro, where it still remains. The baptistery of Concordia was probably erected in 1100.

See Ch. Hülsen in Pauly-Wissowa, Realencyclopadie, iv. (Stuttgart, 1901) 830.

**CONCRETE** (Lat. concretus, participle of concrescere, to grow together), a term used in various technical senses with the general significance of combination, conjunction, solidity. Thus the building material made up of separate substances combined into one is known as concrete (see below). In mathematics and music, the adjective has been used as synonymous with "continuous" as opposed to "discrete," i.e. "separate," "discontinuous." This antithesis is no doubt influenced by the idea that two separate elements from a concrete origin, whereas "discrete" is derived from the Latin *discenternere* in logic and also in common language concrete terms are those which signify persons or things as opposed to abstract terms which signify qualities, relations, attributes (so J. S. Mill). Thus the term "man" is concrete, while "manhood" and "humanity" are abstract, the names of the qualities implied. Confusions between abstract and concrete terms are frequent; thus the word "relation," which is strictly an abstract term implying connexion between two things or persons, is often used instead of the correct term "relative" for people related to one another.

Concrete terms are further subdivided as Singular, the names of things regarded as individuals, and General or Common, the names which a number of things bear in common in virtue of their possession of common characteristics. These latter terms, though concrete in so far as they denote the persons or things which are known by them (see *Denotation*), have also an abstract sense when viewed connotatively, i.e. as implying the quality or qualities in isolation from the individuals. The ascription of adjectives to the class of concrete terms, upheld by J. S. Mill, has been disputed on the ground that adjectives are applied both to concrete and to abstract terms. Hence some logicians make a separate class for adjectives, as being the names neither of things nor of qualities, and describe them as *Attributive terms*.

**CONCRETE**, the name given to a building material consisting generally of a mixture of broken stone, sand and some kind of cement. To this is added water, which combining chemically with the cement conglomerates the whole mixture into a solid mass, and forms a rough but strong artificial stone. It has thus the immense advantage over natural stone that it can be easily moulded while wet to any desired shape or size. Moreover, its constituents can be obtained in almost any part of the world, and its manufacture is extremely simple. On account of these properties, builders have come to give it a distinct preference over stone, brick, timber and other building materials. So popular has it become that besides being used for massive constructions like breakwaters, dock walls, culverts, and for foundations of buildings, lighthouses and bridges, it is also proving its usefulness to the architect and engineer in many other ways. A remarkable extension of the use of concrete has been made possible by the introduction of scientific methods of combining it with steel or iron. The floors and even the walls of important buildings are made of this combination, and long span bridges, tall factory chimneys, and large water-tanks are among the many novel uses to which it has been put. Pilings made of steel concrete are driven into the ground with blows that would shatter the best of timber. A fuller description of the combination of steel and concrete will be given later.

The constituents of concrete are sometimes spoken of as the *matrix* and the *aggregate*, and these terms, though somewhat old-fashioned, are convenient. The matrix is the lime or cement, whose chemical action with the added water causes the concrete to solidify; and the aggregate is the broken stone or hard material which is embedded in the matrix. The matrix most commonly used is Portland cement, by far the best and strongest of them all. The subject of its manufacture and examination is a most important and interesting one, and the special article dealing with it should be studied (see *Cement*). Here it will only be said that before using Portland cement very careful tests should be made to ascertain its quality and condition. Moreover, it should be kept in a damp-proof store for a few weeks; and when taken out for use it should be mixed and placed in position as quickly as possible, because rain, or even moist air, spoils it by causing it to set prematurely. The oldest of all the matrices is lime, and many splendid examples of its use by the Romans still exist. It has been to a great extent superseded by Portland cement, on account of the much greater strength of the latter, though lime concrete is still used in many places for dry foundations and small structures. To be of service the lime should be what is known as "hydraulic," that is, not pure or "fat," but containing some argillaceous matter, and should be carefully slaked with water before being mixed with the aggregate. When the mass is properly done, the lumps of lime should be broken up so that when enough water to slake them should be added, the lime then being allowed to rest for about forty-eight hours, when the water changes the particles of quicklime to hydrate of lime, and breaks up the hard lumps into a powder. The hydrated lime, after being passed through a fine screen to sort out any lumps unaffected by the water, is ready for concrete making, and if not required at once should be stored in a dry place. Other matrices are slag cement, a comparatively recent invention, and some other natural and artificial cements which find occasional advocates. Materials like tar and pitch are sometimes employed as a matrix; they are used hot and without water, the solidifying action being due to cooling and to evaporation of the mineral oils contained in them. Whatever matrix is used, it is almost invariably "diluted" with sand, the grains of which become coated with the finer particles of the matrix. The sand should be coarse-grained and hard. It should be free from dirt—that is to say, free from clay or soft mud, for instance, which prevents the cement adhering to its particles, or again from sewage matter or any substance which will chemically destroy the matrix. The grains should show no signs of decay, and by preference should be of an angular shape. The sand obtained by crushing granite and hard stones is excellent. When lime is used as a matrix, certain natural earths such as pozzolana or tarss, or, failing these, powdered bricks or tiles, may be used instead of sand with great advantage. They have the property of entering into chemical combination with the lime, forming a hard setting compound, and increasing the hardness of the resulting concrete.

The commonest aggregates are broken stone and natural flint gravel. Broken bricks or tiles and broken furnace slag are sometimes used, the essential points being that the aggregate should be hard, clean and sound. Generally speaking, broken stones will be rough and angular, whereas the stones in flint gravel will be comparatively smooth and round. It might be supposed, therefore, that the broken stone will necessarily be the better aggregate, but this does not always follow. Experience shows that, although spherical pebbles are to be avoided, broken Portland stone adheres tightly to smooth flint surfaces, and that rough stones often give a less compact concrete than smooth ones on account of the difficulty of bedding them into the matrix when laying the concrete. In mixing concrete there is always a tendency for the stones to separate themselves from the sand and cement, and to form "pockets" of honeycombed concrete which are neither water-tight nor strong. These are much more liable to occur when the stones are flat and angular than when they are round. Modern engineers favour the practice of having the stones of various sizes instead of being uniform, because if these sizes are wisely proportioned the whole mixture can be made more solid, and the rough "pockets" avoided. For first-class work, however, and especially in steel concrete, it is customary to reject very large
CONCRETE

stones, and to insist that all shall pass through a ring \( \frac{3}{4} \) of an inch in diameter.

The water, like all the other constituents of concrete, should be clean and free from vegetable matter. At one time sea-water was thought to be injurious, but modern investigation finds no objection to it except on the score of appearance, efflorescence being more likely to occur when it is used.

Sometimes in massive concrete structures large and heavy stones as big as a man can lift are buried in the concrete after it is laid in position but while it is still wet. The stones should be hard and clean, and care must be taken that they are completely surrounded. Such concrete is known as rubble concrete.

In proportioning the quantities of matrix to aggregate the ideal to be aimed at is to get a concrete in which the voids or air-spaces shall be as small as possible; and as the lime or cement is usually by far the most expensive item, it is desirable to use as little of it as is consistent with strength.

When natural flint gravel containing both stones and sand is used, it is usual to mix so much gravel with so much lime or cement. The proportions in practice generally run from 3 to 1 for very rough work, down to 2 to 1 for unimportant work. Some engineers have the sand separated from the stones by screens or sieves and then remixed in definite proportions. When stones and sand are obtained from different sources, their relative proportions have to be decided upon. A common way of doing this is first to choose a proportion of sand to cement, which will probably vary from 1 to 1 up to 4 to 1. It then remains to determine what proportion of stones should be added. For this purpose a large can, whose volume is known, is filled loosely with stones, and the volume of the voids between them is determined by measuring how much water the can will hold in addition to the stones. It is then assumed that the quantity of sand and cement should be equal to the voids. Moreover, the volume of sand and cement together is generally assumed to be equal to that of the sand alone, as the cement to a large extent fills up voids in the sand.

For example, suppose it is resolved to use 2 parts of sand to 1 of cement, and suppose that experiment shows that in a pile of stones two-fifths of the volume consists of voids, then 2 parts of sand (or sand with cement) will fill voids in 5 parts of stones, and the proportion of cement, sand, stones becomes 1:2:5. There are several weak points in this reasoning, and a more accurate way of determining the best proportions is to try different mixtures of cement, stones and sand, filling them into different pails of the same size, and then ascertaining, by weighing the pails, which mixture is the densest.

In determining the amount of water to be added, several things must be considered. The amount required to combine chemically with the cement is about 16% by weight, but in practice much more than this is used, because of loss by evaporation, and the difficulty of ensuring that the water shall be uniformly distributed. If the situation is cool, the stone hard, and the concrete carefully rammed directly it is laid down and kept moist with damp cloths, only just sufficient to moisten the whole mass is required. On the other hand, water should be given generously in hot weather, also when absorbent stone is used or when the concrete is not rammed. In these cases the concrete should be allowed to take all it can, but an excess of water which would flow away, carrying the cement with it, should be avoided.

The thorough mixing of the constituents is a most important item in the production of good concrete. Its object is to distribute all the materials evenly throughout the mass, and it is performed in many different ways, both by hand and by machine. The relative values of hand and machine work are often discussed. Roughly it may be said that where a large mass of concrete is to be mixed at one or two places a good machine will be of great advantage. On the other hand, where the mixing platform has to be constantly shifted, hand mixing is the more convenient way. In hand mixing it is usual to measure out from gauge boxes the sand, stones and cement or lime in a heap on a wooden platform. Then they are turned once or twice in their dry state by men with shovels. Next water is carefully added, and the mixture again turned, when it is ready for depositing. For important work and especially for thin structures the number of turnings should be increased. Many types of mixing machines are obtainable; the favourite type is one in which the materials are placed in a large iron box which is made to rotate, thus tumbling the matrix and aggregate over each other again and again. Another simple apparatus is a large vertical pipe or shoot in which sloping baffle plates or shelves are placed at intervals. The materials are fed in at the top of the shoot and fall from shelf to shelf, the mixing being effected by the various shocks thus given. When mixed the concrete is carried at once to the position required, and if the matrix is quick-setting Portland cement this operation must not be delayed.

One of the few drawbacks of concrete is that, unlike brickwork or masonry, it has nearly always to be deposited within moulds or frames which give it the required shape, and which are removed after it is set. Indeed, the trouble and expense of these moulds sometimes prohibit its use. It is essential that they shall be strong and stiff, so as not to yield at all from the pressure of the wet concrete. The moulds for the face of a wall consist generally of wooden shutters, leaning against them are the stones, which are secured by horizontal or raking struts to firm ground so as to be avoided. If a smooth and neat face is wanted other precautions must be taken. The shutters must be planed, and coated with a mixture of soap and oil, so as to come away easily after the concrete is set. Moreover, when depositing the concrete, a shovel or other tool must be worked between the wet concrete and the shutter. This draws sand and water to the face and prevents the rough stones from showing themselves. Sometimes rough concrete is rendered over with a plaster of cement and sand after the shutters have been removed, but this is liable to peel off and should be avoided.

The method of depositing depends on the situation. If for important walls, or for small scantlings such as steel concrete generally involves, the concrete should be deposited in quite small quantities and very carefully rammed into position. If for massive walls, it is usual to tip it out in large quantities from a barrel or wagon, and simply spread it in layers about a foot thick. Depositing concrete under water for breakwater and bridge foundations requires special skill and special appliances. It is usually done in one of three ways:—(a) By moulding the concrete ashore into large blocks, which, when sufficiently hard, are lowered through the water into position by a crane or similar machine with the aid of divers. The most notable instance of this type of construction was at the port of Dublin, where Mr B. B. Stoney made blocks no less than 350 tons in weight. Each block formed a piece of the quay wall 12 ft. long and 27 ft. high, being made on shore and then deposited in position by floating sheers of special design. (b) By moulding the concrete into what are called “bag-blocks.” In this system the concrete is filled into bags, which are at once lowered through the water like the blocks. But in this case the concrete being still wet can adapt itself more or less to the shape of the adjoining bags, and strong rough walls can be built in this way. Sometimes the bags are made of enormous size, as at Aberdeen breakwater, where the contents of each bag weighed 60 tons. The canvas was laid in a hopper barge and then filled with the concrete and sewn up. The enormous bag was then dropped through a door in the bottom of the barge upon the breakwater foundation. (c) By depositing the wet concrete through the water between temporary upright timber frames which form the two faces of the wall. In this case very great care has to be taken to prevent the cement from being washed away from the other constituents when passing through the water. Indeed, this is bound to happen more or less, but it is guarded against by lowering the concrete slowly in a special box, the bottom of which is opened as it reaches the ground on which the concrete is to be laid. This method can only be carried out in still water, and where strong and tight framing can be built which will prevent the concrete from escaping. For small work the box can be replaced by a
canvas bag secured by a special tripping noose which can be loosened when the bag has reached the ground. The concrete escapes from the bag, which is then drawn up and refilled.

Concrete may be compared with other building materials like masonry or timber from various points of view, such as strength, durability, convenience of building, fire-resistance, appearance and cost. Its strength varies within very wide limits according to the quality and proportions of the constituents, and the skill shown in mixing and placing them. To give a rough idea, however, it may be said that its safe crushing load would be about $\frac{1}{2}$ cwt. per sq. in. for lime concrete, and 1 to 5 cwt. for Portland cement concrete. The safe tensile strength of Portland cement concrete would be something like one-tenth of its compressive strength, and might be far less. On this account it is usual to neglect the tensile strength of concrete in design structures, and to arrange the material in such a way that tensile stresses are avoided. Hence slabs or beams of long span should not be built of plain concrete, though when reinforced with steel it is admirably adapted for these purposes.

In regard to durability good Portland cement concrete is one of the most durable materials known. Neither hot, cold, nor wet weather has practically any effect whatever upon it. Frost will not injure it after it has once set, though it is essential to keep it from frost during the operations of mixing and depositing. The same praise cannot, however, be given to lime concrete. Even though the best hydraulic lime be used it is wise to confine it to places where it is not exposed to the air, or to running water, and indeed for important structures the use of lime should be avoided. Good Portland cement is so much stronger than any lime that there are few situations where it is not cheaper as well as better to use the former, because, although cement is the more expensive matrix, a smaller proportion of it will suffice for use. Lime should never be used in work exposed to sea-water, or to water containing chemicals of any kind. Portland cement concrete, on the other hand, may be used without fear in sea-water, provided that certain reasonable precautions are taken. Considerable alarm was created about the year 1887 by the failure of two or three large structures of Portland cement concrete exposed to seawater, both in England and other countries. The matter was carefully investigated, and it was found that the sulphate of magnesia in the sea-water has a decomposing action on Portland cements, especially those which contain a large proportion of lime or even of alumina. Indeed, no Portland cement is free from the said compound decomposed by sea-water, and on a moderate scale this action is always going on more or less. But to ensure the permanence of structures in sea-water the great object is to choose a cement containing as little lime and alumina as possible, and free from sulphates such as gypsum; and more important still to proportion the sand and stones in the concrete in such a way that the structure is practically non-porous. If this is done there is really nothing to fear. On the other hand, if the concrete is rough and porous the sea-water will gradually eat into the heart of the structure, especially in a case like a dam, where the water, being higher on one side than the other, constantly forces its way through the rough material, and decomposes the Portland cement it contains.

As regards its convenience for building purposes it may be said roughly that in “mass” work concrete is vastly more convenient than any other material. But concrete is hampered by the fact that the surface always has to be formed by means of wooden or other framing, and in the case of thin walls or floors this framing becomes a serious item, involving expense and delay. In appearance concrete can rarely if ever rival stone or brickwork. It is true that it can be moulded to any desired shape, but mouldings in concrete generally give the appearance of being unsatisfactory imitations of stone. Moreover, its colour is not pleasing. These defects will no doubt be overcome as concrete grows in popularity as a building material and its aesthetic treatment is better understood. Concrete pavings are being used in buildings of first importance, the aggregate being very carefully selected, and in many cases the whole mixture coloured by the use of pigments. Care must be taken in their selection, however, as certain colouring matters such as red lead are destructive to the cement. One of the great objections to the appearance of concrete is the fact that soon after its erection irregular cracks invariably appear on its surface. These cracks are probably due to shrinkage while setting, aggravated by changes in temperature. They occur no less in structures of masonry and brickwork, but in these cases they generally follow the joints, and are almost imperceptible. In the case of a smooth concrete face there are no joints to follow, and the cracks become an ugly feature. They are sometimes regulated by forming artificial “joints” in the structure by embedding strips of wood or sheet iron at regular intervals, thus forming “lines of weakness,” at which the cracks therefore take place. A pleasing “rough” appearance can be given to concrete by brushing it over soon after it has set with a stiff brush dipped in water or dilute acid. Or, if hard, its surface can be picked all over with a bush hammer.

At one time Portland cement concrete was considered to be lacking in fireproof qualities, but now it is regarded as one of the best fire-resisting materials known. Although experiments on this matter are badly needed, there is little doubt that good steel concrete is very nearly indestructible. The matrix should be Portland cement, and the nature of the aggregate is important. Cinders have been and are still much favoured for this purpose. The reason for this preference lies in the fact that being porous and full of air, they are a good non-conductor. But they are weak, and modern experience goes to show that a strong concrete is the best, and that probably materials like broken brick or burnt clay, which are porous and yet strong, are far better than cinders as a fireproof aggregate. Limestone should be avoided, as it soon splits under heat. The steel reinforcement is of immense importance in fireproof work, because, if properly designed, it enables the concrete to hold together and do its work even when it has been cracked by fire and water. On the other hand, the concrete, being a non-conductor, preserves the steel from being softened and twisted by excessive temperature.

Only very general remarks can be made on the subject of cost, as this item varies greatly in different situations and with the market price of the materials used. But in England it may be said that for massive work such as big walls and foundations concrete is nearly always cheaper than brickwork or masonry. On the other hand, for reasons already given, thin walls, such as house walls, will cost more in concrete. Steel concrete is even more difficult to compare as its use is comparatively new, but even in the matter of first cost it is proving a serious rival to timber and to plate steel work, in floors, bridges and tanks, and to brickwork and plain concrete in structures such as culverts and retaining walls, towers and domes.

Artificial Stones.—There are many varieties of concrete known as “artificial stones” which can now be bought ready moulded into the form of paving slabs, wall blocks and pipes: they are both pleasing in appearance and very durable, being carefully made by skilled workmen. Granolithic, globe granite and synthetic stone are examples of these. Some, such as victoria stone, imperial stone and others, are hardened and rendered non-porous after manufacture by immersion in a solution of silicate of soda. Others, like Ford’s silicate of limestone, are practically lime mortars of excellent quality, which can be carved and cut like a sandstone of fine quality.

Steel Concrete.—The introduction of steel concrete (also known as ferroconcrete, armoured concrete, or reinforced concrete) is generally attributed to Joseph Monier, a French gardener, who about the year 1868 was anxious to build some concrete water basins. In order to reduce the thickness of the walls and floor he conceived the idea of strengthening them by building in a network of iron rods. As a matter of fact other inventors were at work before Monier, but he deserves much credit for having pushed his invention with vigour, and for
having popularized the use of this invaluable combination. The important point of his idea was that it combined steel and concrete in such a way that the best qualities of each material were brought into play. Concrete is readily procured and easily moulded into shape. It has considerable compressive or crushing strength, but is somewhat deficient in shearing strength, and distinctly weak in tensile or pulling strength. Steel, on the other hand, is easily procurable in simple forms such as long bars, and is exceedingly strong. But it is difficult and expensive to work up into various forms. Concrete has been avoided for making beams, slabs and thin walls, just because its deficiency in tensile strength doomed it to failure in such structures. But if a concrete slab be "reinforced" with a network of small steel rods on its under surface where the tensile stresses occur (see fig. 1) its strength will be enormously increased. Thus the one point of weakness in the concrete slab is overcome by the addition of steel in its simplest form, and both materials are used to their best advantage. The scientific and practical value of this idea was soon seized upon by various inventors and others, and the number of patented systems of combining steel with concrete is constantly increasing. Many of them are but slight modifications of the older systems, and no attempt will be made here to describe them in full. In England it is customary to allow the patentee of one or other system to furnish his own designs, but this is as much because he has gained the experience needed for success as because of any special virtue in this or that system. The majority of these systems have emanated from France, where steel concrete is largely used. America and Germany adopted them readily, and in England some very large structures have been erected with this material. The concrete itself should always be the very best quality, and Portland cement should be used on account of its superiority to all others. The aggregate should be the best obtainable and of different sizes, the stones being freshly crushed and screened to pass through a \( \frac{1}{4} \) in. ring. Very special care should be taken so to proportion the sand as to make a perfectly impervious mixture. The proportions generally used are 4 to 1 and 5 to 1 in the case of gravel concrete, or 1:2:4, or 1:2:8 in the case of broken stone concrete. But, generally speaking, in steel concrete the cost of the cement is but a small item of the whole expense, and it is worth while to be generous with it. If it is used in piles or structures where it is likely to be bruised the proportion of cement should be increased. The mixing and laying should all be done very thoroughly; the concrete should be rammed in position, and any old surface of concrete which has to be covered should be cleaned and coated with fresh cement.

The reinforcement mostly consists of mild steel and sometimes of wrought iron. Steel, however, is stronger and generally cheaper, so that in English practice it holds the field. It should be mild and is usually specified to have a breaking (tensile) strength of 28 to 32 tons per sq. in., with an elongation of at least 20% in 8 in. Any bar should be capable of being bent cold to the shape of the letter U without breaking it. The steel is generally used in the form of long bars of circular section. At first it was feared that such bars would have a tendency to slip through the concrete in which they were embedded, but experiments have shown that if the bar is not painted but has a natural rusty surface a very considerable adhesion between the concrete and steel—as much as 2 cwt. per sq. in. of contact surface—may be relied upon. Many devices are used, however, to ensure the adhesion between concrete and bar being perfect. (1) In the Hennebique system of construction the bars are flattened at the end and split to form a "fish tail." (2) In the Ransome system round bars are rejected in favour of square bars, which have been twisted in a lathe in "barley sugar" fashion. (3) In the Habrick system a flat bar similarly twisted is used. (4) In the Thacher system a flat bar with projections like rivet heads is specially rolled for this purpose. (5) In the Kahn system a square bar with "branches" is used. (6) In the "expanded metal" system no bars are used, but instead a strong steel netting is manufactured in large sheets by special machinery. It is made by cutting a series of long slots at regular intervals in a plain steel plate, which is then forcibly stretched out sideways until the slots become diamond-shaped openings, and a trellis work of steel without any joints is the result (fig. 2).

The structures in which steel concrete is used may be analysed as consisting essentially of (1) walls, (2) columns, (3) piles, (4) beams, (5) slabs, (6) arches. The designs differ considerably according to which of these purposes the structure is to fulfil.

The effect of reinforcing walls with steel is that they can be made much thinner. The steel reinforcement is generally applied in the form of vertical rods built in the wall at intervals, with lighter horizontal rods which cross the vertical ones, and thus form a network of steel which is buried in the concrete. These rods assist in taking the weight, and the whole network binds the concrete together and prevents it from cracking under a heavy load. The vertical rods should not be quite in the middle of the wall but near the inner and outer faces alternately. Care must be taken, however, that all the rods are covered by at least an

---

**Fig. 2.—Section through Intersection.**

**Fig. 3.—Hennebique System.**

**Fig. 4.—Hennebique System.**
inch of concrete to preserve them from damage by rust or fire. In the Cottancin system the concrete is replaced by bricks pierced with holes through which the vertical rods are threaded; the horizontal tie-rods are also used, but these do not merely cross the vertical ones, but are woven in and out of them. Columns have generally to bear a heavier weight than walls, and have to be correspondingly stronger. They have usually been made square with a vertical steel rod at each corner. To prevent these rods from spreading apart they must be tied together at frequent intervals. In some systems this is done by loops of stout wire connecting each rod to its neighbour, and placed one above the other about every 10 in. up the column (figs. 3 and 4). In other systems a stout wire is wound continuously in a spiral form round the four rods. Modern investigation goes to prove that the latter is theoretically the more economical way of using the steel, as the spiral binding wire acts like the binding of a wire gun, and prevents the concrete which it encloses from bursting even under very great loads.

That steel concrete can be used for piles is perhaps the most astonishing feature in this invention. The fact that a comparatively brittle material like concrete can be subjected not only to heavy loads but also to the jar and vibration from the blows of a heavy pile ram makes it appear as if its nature and properties had been changed by the steel reinforcement. In a sense this is undoubtedly the case. A. G. Considère's experiments have shown that concrete when reinforced is capable of being stretched, without fracture, about twenty times as much as plain concrete. Most of the piles driven in Great Britain have been made on the Hennebique system with four or six longitudinal steel rods tied together by stirrups or loops at frequent intervals. Piles made on the Williams system have a steel rolled joist of I section buried in the heart of the pile, and round it a series of steel wire hoops at regular intervals (fig. 5).

Whatever system is used, care must be taken not to batter the head of the pile to pieces with the heavy ram. To prevent this an iron "helmet" containing a lining of sawdust is fitted over the head of the pile. The sawdust adapts itself to the rough shape of the concrete, and deadens the blow to some extent.

But it is in the design of steel concrete beams that the greatest ingenuity has been shown, and almost every patentee of a "system" has some new device for arranging the steel reinforcement to the best advantage. Concrete by itself, though strong in compression, can offer but little resistance to tensile and shearing stresses, and as these stresses always occur in beams the problem arises how best to arrange the steel so as to assist the concrete in bearing them. To meet tensile stresses the steel is nearly always inserted in the form of bars running along the beam. Figs. 6 to 9 show how they are arranged for different loading. In each case the object is to place the bars as nearly as possible where the tensile stresses occur. In cases where all the stresses are heavy, that portion of the beam which is under compression is similarly reinforced, though with smaller bars (figs. 10 and 11).

But as these tension and compression bars are generally placed near the under and upper surface of the beam they are of little use in helping to resist the shearing stresses which are greatest at its neutral axis. (See Bridges.) These shearing stresses in a heavily loaded beam would cause it to split horizontally at or near the centre. To prevent this many ingenious devices have been introduced. (1) Perhaps one of the most efficient is a diagonal bracing of steel wire passing to and fro between the upper and lower bars and firmly secured to each by lapping or otherwise (fig. 12); this device is used in the Coignet and other French systems. (2) In the Hennebique system (which has found great favour in England) vertical bands or "stirrups," as they are generally called, of hoop steel are used (fig. 13). They are of U shape, and passing round the tension bars extend to the top of the beam (figs. 14 and 3). They are exceedingly thin, but being buried in concrete no danger of their perishing from rust is to be feared.

(3) In the Bous-siron system a similar stirrup is used, but instead of being vertical the two parts are spread so that each is slightly inclined. (4) In the Coularon system, the stirrups are inclined as in fig. 15, and consist of rods, the ends of which are hooked over the tension and compression bars. (5) In the Kahn system the stirrups are similarly arranged, but instead of being merely secured to the tension bar, they form an integral part of it like brackets on a string, the bar being rolled to a special section to admit of this. (6) In many systems such as the "expanded metal" system, the tension and compression rods together with the stirrups are all abandoned in favour of a single rolled steel joist of I section, buried in concrete (see fig. 16). Probably the weight of steel used in this way is excessive, but the joists are cheap, readily procurable and easy to handle.

Floor slabs may be regarded as wide and shallow beams, and the remarks made about the stresses in the one apply to the other also; accordingly, the various devices which are used for strengthening beams recur in the slabs. But in a thin slab, with its comparatively small span and light load, the concrete is generally strong enough to bear the shearing stresses unaided, and the reinforcement is devoted to assisting it where the tensile stresses occur. For this purpose many designers simply

CONCRETION

use the modification of the Monier system, consisting of a horizontal network of crossed steel rods buried in the concrete. "Expanded metal" too is admirably adapted for the purpose (fig. 1). In the Matrai system thin wires are used instead of rods, and are securely fastened to rolled steel joists, which form the beams on which the slabs rest; moreover, the wires instead of being stretched tight from side to side of the slab are allowed to sag as much as the thickness of the concrete will allow. In

![Expanded Steel](image)

Fig. 16.

the Williams system small flat bars are used, which are not quite horizontal, but pass alternately over and under the rolled joists which support the slabs.

A concrete arch is reinforced in much the same way as a wall, the stresses being somewhat similar. The reinforcing rods are generally laid both longitudinally and circumferentially. In the case of a culvert the circumferential rods are sometimes laid continuously in the form of a spiral as in the Bordenave system.

To those wishing to pursue the subject further, the following books among others may be suggested:—Sabin, *Cement and Concrete* (New York); Taylor and Thompson, *Concrete, Plain and Reinforced* (London); Sutcliffe, *Concrete, Nature and Uses* (London); Marshall and Dunn, *Reinforced Concrete* (London); Twemlay, *Concrete Steel* (London); Paul Christophe, *Le Béton armé* (Paris); Buel and Hill, *Reinforced Concrete Construction* (London). (F. E. W. S.)

CONCRETION, in petrology, a name applied to nodular or irregularly shaped masses of various size occurring in a great variety of sedimentary rocks, differing in composition from the main mass of the rock, and in most cases obviously formed by some chemical process which ensued after the rock was deposited. As these bodies present so many variations in composition and in structure, it will conduce to clearness if some of the commonest be briefly adverted to. In sandstones there are often hard rounded lumps, which separate out when the rock is broken or weathered. They are mostly siliceous, but sometimes calcareous, and may differ very little in general appearance from the bulk of the sandstone. Through them the bedding passes uninterrupted, thus showing that they are not pebbles; often in their centres shells or fragments of plants are found. Argillaceous sandstones and flagstones very frequently contain "clay balls" or concretionary lumps richer in clay than the remainder of the rock. Nodules of pyrites and of marcasite are common in many clays, sandstones and marls. Their outer surfaces are tuberculate; internally they commonly have a radiate fibrous structure. Usually they are covered with a dark brown crust of limonite produced by weathering; occasionally imperfect crystalline faces may bound them. Not infrequently (e.g. in the Gault) these pyritous nodules contain altered fossils. In clays also siliceous and calcareous concretions are often found. They present an extraordinary variety of shapes, often grotesquely resembling figures of men or animals, fruits, &c., and have in many countries excited popular wonder, being regarded as of supernatural origin ("fairy-stones," &c.), and used as charms.

Another type of concretion, very abundant in many clays and shales, is the "septarian nodule." These are usually flattened disk-shaped or ovoid, often lobulate externally like the surface of a kidney. When split open they prove to be traversed by a network of cracks, which are usually filled with calcite and other minerals. These white infilings of the fissures resemble partitions; hence the name from the Latin *septum*, a partition. Sometimes the cracks are partly empty. They vary up to half an inch in breadth, and are best seen when the nodule is cut through with a saw. These concretions may be calcareous or may consist of carbonate of iron. The former are common in some beds of the London Clay, and were formerly used for making cement. The clay-ironstone nodules or sphaerosiderites are very abundant in some Carboniferous shales, and have served in some places as iron ores. Some of the largest specimens are 3 ft. in diameter. In the centre of these nodules fossils are often found, e.g. coprolites, pieces of plants, fish teeth and scales. Phosphatic concretions are often present in certain limestones, clays, shelly sands and marls. They occur, for example, in the Cambridge Greensand, and at the base of certain of the Pliocene beds in the east of England. In many places they have been worked, under the name of "coprolite-beds," as sources of artificial manures. Bones of animals more or less completely mineralized are frequent in these phosphatic concretions, the commonest being fragments of extinct reptilia. Their presence points to a source for the phosphate of lime.

Another very important series of concretionary structures are the nodules which occur in chalk, and the patches and bands of chert which are found in limestones. Flints consist of dark-coloured cryptocrystalline silica. They weather grey or white by the removal of their more soluble portions by percolating water. Their shapes are exceedingly varied, and often they are studded with tubercules and nodosities. Sometimes they have internal cavities, and very frequently they contain shells of echinoderms, molluscs, &c., partly or entirely replaced by silica, but preserving their original forms. Chert occurs in bands and tabular masses rather than in nodules; it often replaces considerable portions of a bed of limestone (as in the Carboniferous Limestones of Ireland). Corals and other fossils frequently occur in chert, and when sliced and microscopically examined both flint and chert often show silified foraminifera, polyzoa &c., and sponge spicules. Flints in chalk frequently lie along joints which may be vertical or may be nearly horizontal and parallel to the bedding. Hence they increase the stratified appearance of natural exposures of chalk.

It will be seen from the details given above that concretions may be calcareous, siliceous, argillaceous and phosphatic, and they may consist of carbonate or sulphide of iron. In the red clay of the deep sea bottom concretionary masses rich in manganese dioxide are being formed, and are sometimes brought up by the dredge. In clays large crystals of gypsum, having the shape of an arrow-head, are occasionally found in some numbers. They bear a considerable resemblance to some concretions, e.g. crystal line marcasite and pyrite nodules. These examples will indicate the great variety of substances which may give rise to concretionary structures.

Some concretions are amorphous, e.g. phosphatic nodules; others are cryptocrystalline, e.g. flint and chert; others finely crystalline, e.g. pyrites, sphaerosiderite; others consist of large crystals, e.g. gypsum, barytes, pyrites and marcasite. From this it is clear that the formation of concretions is not closely dependent on any single inorganic substance, or on any type of crystalline structure. Concretions seem to arise from the tendency of chemical compounds to be slowly dissolved by interstitial water, either while the deposit is unconsolidated or at a later period. Certain nuclei, present in the rock, then determine reprecipitation of these solutions, and the deposit once begun goes on till either the supply of material for growth is exhausted, or the physical character of the bed is changed by pressure and consolidation till it is no longer favourable to further accretion. The process resembles the growth of a crystal in a solution by slowly attracting to itself molecules of suitable nature from the surrounding medium. But in the majority of cases it is not the crystalline forces, or not these alone, which attract the particles. The structure of a flint, for example, shows that the material had so little tendency to crystalize that it remained permanently in cryptocrystalline or subcrystalline state. That the concretions grew in the solid sediment is proved by the manner in which bedding pass through
CONCUBINAGE—CONDÉ

The Roman law recognized two classes of legal marriage: (1) with the definite public ceremonies of *confraratio* or *coemiptio*, and (2) without any public form whatever and resting merely on the *affectio matralis*, i.e., the fixed intention of taking a particular woman as a permanent spouse. 1 Next to these strictly lawful marriages came concubinage as a recognized legal status, so long as the two parties were not married and had no other concubines. It differed from the formless marriage in the absence (1) of *affectio matralis*, and therefore (2) of all confugal rights. For instance, the concubine was not raised, like the wife, to her husband's rank, nor were her children legitimate, though they enjoyed legal rights forbidden to mere bastards, e.g., the father was bound to maintain them and to leave them (in the absence of legitimate children) one-sixth of his property; moreover, they might be fully legitimated by the subsequent marriage of their parents.

In the East, the emperor Leo the Philosopher (d. 911) insisted on formal marriage as the only legal status; but in the Western Empire concubinage was still recognized even by the Christian emperors. The early Christians had naturally preferred the formless marriage of the Roman law as being free from all taint of pagan idolatry; and the ecclesiastical authorities recognized concubinage also. The first council of Toledo (386) bids the faithful restrict himself "to a single wife or concubine, as it shall please him"; 2 and there is a similar canon of the Roman synod held by Pope Eugenius II. in 826. Even as late as the Roman councils of 1052 and 1063, the suspension from communion of laymen who had a wife and a concubine at the same time implies that mere concubinage was tolerated. It was also recognized by many early civil codes. In Germany "left-handed" or "morganatic" marriages were allowed by the Sæc law between nobles and women of lower rank. In different states of Spain the laws of the later middle ages recognized concubinage under the name of *barraganzia*, the contract being lifelong, the woman obtaining by it a right to maintenance during life, and sometimes also to part of the succession, and the sons ranking as illegitimates if their father was a noble. In Iceland, the concubine was recognized in addition to the lawful wife, though it was forbidden that they should dwell in the same house. The Norwegians in the fourteenth century allowed that in default of legitimate sons, the kingdom should descend to illegitimates. In the Danish code of Valdemar II., which was in force from 1280 to 1583, it was provided that a concubine kept openly for three years shall thereby become a legal wife; this was the custom of *hand vesten*, the "handfasting" of the English and Scottish borders, which appears in Scott's *Monastery*.

In Scotland, the laws of William the Lion (d. 1214) speak of concubinage as a recognized institution; and, in the same century, the great English legislist Bracton treats the "concubina legitima" as entitled to certain rights. 3 There seems to have been at times a pardonable confusion between some quasi-legitimate unions and those marriages by mere word of mouth, without ecclesiastical or other ceremonies, which the church, after some natural hesitation, pronounced to be valid. 4 Another and more serious confusion between concubinage and marriage was caused by the gradual enforcement of clerical celibacy (see CELTIC). During the bitter conflict between laws which forbade sacerdotal marriages and long custom which had permitted them, it was natural that the legislator would incline towards the civil government. The history of Abraham's family shows us clearly that the concubine might be dismissed at any time, and her children were liable to be cast off equally summarily with gifts, in order to leave the inheritance free for the wife's sons (Genesis xxii. 9 ff., xxvi. 5 ff.).

1 The difference between English and Scottish law, which once made Gretna Green marriages so frequent, is due to the fact that Scottish law departed from the Roman canon law (which on this particular point was followed by the whole medieval church).

2 Gratian, in the 12th century, tried to explain this away by assuming that concubinage here referred to meant a formless marriage; but in 386 a church council can scarcely so have misused the technical terms of the then current civil law (Gratian, Decretum, pars i. dist. xxiv. c. 4).

3 Bracton, De Legibus, lib. iii. tract. ii. c. 28, § 1, and lib. iv. tract. vi. c. 8, § 4.

4 F. Pollock and F. W. Maitland, *Hist. of English Law*, 2nd ed. vol. ii. p. 376. In the case of Richard de Anesty, decided by papal brief of 1143, the court in *Exon. Reg.*, p. 371, treated the case as involving only a marriage of which a child had been born, was set aside as null in favour of an earlier marriage constituted by a mere exchange of consenting words (ibid. p. 367; cf. the similar decratel of Alexander the Great, *Sessio Primae* 1227). The canonical canon law and the acte illustre the difficulty of distinguishing, even as late as the middle of the 15th century, between concubinage and a clandestine, though legal, marriage. He falls back on the definition of an earlier canonist (Bracton, De Legibus, lib. iii. tract. 12): "A marriage by the husband's own wish in which he takes her to church, she may be presumed to be his wife; if, however, he sends her to draw water and dresses her in vile clothing, she is probably a concubine (Procivinale, ed. Oxon. 1679, p. 10, s. n. concubinum).

5 It may be gathered from the Dominican C. L. Richard's *Analysis Concitorium* (vol. ii., 1778) that there were more than 110 such complaints in councils and synods between the years 1000 and 1528. Dr Rashdall (*Universities of Europe in the Middle Ages*, vol. ii. p. 691, note) points out that a master of the university of Prague, in 1499, complained openly to the authorities against a bachelor for assaulting his concubine.
to the belief of his contemporaries, by his wife, Catherine de la Trémouille. This event, among others, awoke strong suspicions as to the legitimacy of his heir and namesake, Henry, prince of Condé (1588–1646). King Henry IV., however, did not take advantage of the scandal. In 1609 he caused the prince of Condé to marry Charlotte de Montmorency, whom shortly after Condé was obliged to save from the king's persistent gallantry by a hasty step to Soissons and then to Italy. On the death of Henry, Condé returned to France, and intrigued against the regent, Marie de' Medici; but he was seized, and imprisoned for three years (1616–1619). There was at that time before the court a plea for his divorce from his wife, but she now devoted herself to enliven his captivity at the cost of her own liberty. During the rest of his life Condé was a faithful servant of the king. He strove to blot out the memory of the Huguenot connexions of his house by affecting the greatest zeal against Protestants. His old ambition changed into a desire for the safe aggrandizement of his family, which he magnificently achieved, and with that end he bowed before Richelieu, whose niece he forced his son to marry. His son Louis, the great Condé, is separately noticed below.

The next in succession was Henry Jules, prince of Condé (1643–1700), the son of the great Condé and of Clémence de Maillé, niece of Richelieu. He fought with distinction under his father in Franchi, Condé and the Low Countries; but he was heartless, avaricious and undoubtedly insane. The end of his life was marked by singular hypochondriacal fancies. He believed at one time that he was dead, and refused to eat till some of his attendants dressed in sheets set him the example. His grandson, Louis Henry, duke of Bourbon (1692–1740), Louis XV.'s minister, did not assume the title of prince of Condé which properly belonged to him.

The son of the duke of Bourbon, Louis Joseph, prince of Condé (1736–1818), after receiving a good education, distinguished himself in the Seven Years' War, and most of all by his victory at Johannisberg. As governor of Burgundy he did much to improve the industries and means of communication of that province. At the Revolution he took up arms in behalf of the king, became commander of the 'army of Condé,' and fought in conjunction with the Austrians till the peace of Campo Formio in 1797, being during the last year in the pay of England. He then returned to France on the death of Louis the Sixteenth (1800) returned into the pay of England, and fought in Bavaria. In 1800 Condé arrived in England, where he resided for several years. On the restoration of Louis XVIII. he returned to France. He died in Paris in 1818. He wrote Essai sur la vie du grand Condé (1758).

LOUIS HENRY JOSEPH, duke of Bourbon (1736–1830), son of the last named, was the last prince of Condé. Several of the earlier events of his life, especially his marriage with the princess Louise of Orleans, and the duel that the comte d'Artois provoked by raising the veil of the princess at a masked ball, caused much scandal. At the Revolution he fought with the army of the emigrés in Liége. Between the return of Napoleon from Elba and the battle of Waterloo, he headed with no success a royalist rising in La Vendée. In 1829 he made a will by which he appointed as his heir the duc d'Aumale, and made some considerable bequests to his mistress, the baronne de Feuchères (q.v.). On the 27th of August 1830 he was found hanged on the fastening of his window. A crime was generally suspected, and the princes de Rohan, who were relatives of the deceased, disputed the will. Their petition, however, was dismissed by the courts.

Two cadet branches of the house of Condé played an important part: those of Soissons and Conti. The first, sprung from Charles of Bourbon (b. 1566), son of Louis I., prince of Condé, became extinct in the legitimate male line in 1641. The second took its origin from Armand of Bourbon, born in 1620, son of Henry II., prince of Condé, and survived up to 1814.

CONDE, LOUIS DE BOURBON, PRINCE OF (1530–1566), fifth son of Charles de Bourbon, duke of Vendôme, younger brother of Antoine, king of Navarre (1518–1562), was the first of the famous house of Condé (see above). After his father's death in 1537 Louis was educated in the principles of the reformed religion. Brave though deformed, gay but extremely poor for his rank, Condé was led by his ambition to a military career. He fought with distinction in Piedmont under Mary of Brissac; in 1552 he forced his way with reinforcements into Metz, then besieged by Charles V.; he led several brilliant sorties from that town; and in 1554 commanded the light cavalry on the Meuse against Charles. In 1557 he was present at the battle of St Quentin, and did further good service at the head of the light horse. But the descendants of the constable de Bourbon were still looked upon with suspicion in the French court, and Condé's services were ignored. The court designed to reduce his narrow means still further by dispatching him upon a costly mission to Philip II. of Spain. His personal griefs thus combined with his religious views to force upon him a rôle of political opposition. He was concerned in the conspiracy of Amboise, which aimed at forcing from the king the recognition of the reformed religion. He was consequently condemned to death, and was only saved by the decease of Francis II. At the accession of the boy-king Charles IX., the policy of the court was changed, and Condé received an audience (1596) and the government of Picardy. But the struggle between the Catholic and the Huguenots soon began once more, and henceforward the career of Condé is the story of the wars of religion (see FRANCE: History). He was the military as well as the political chief of the Huguenot party, and displayed the highest generalship on many occasions, and notably at the battle of St Denis. At the battle of Jarnac, with only 400 horsemen, Condé rashly charged the whole Catholic army. Worn out with fighting, he at last gave up his sword, and a Catholic officer named Montesquiou treacherously shot him through the head on the 13th of March 1590.

CONDE, LOUIS II. DE BOURBON, PRINCE OF (1621–1686), called the Great Condé, was the son of Henry, prince of Condé, and Charlotte Marguerite de Montmorency, and was born at Paris on the 8th of September 1621. As a boy, under his father's careful supervision, he studied diligently at the Jesuits' College at Bourges, and at seventeen, in the absence of his father, he governed Burgundy. His younger brother, Charles the Younger (translated as Condé d'Aumale, born 1641), who resided at the court of Richelieu as a young man, was soon to be embarked in war and distinguished himself for his valor and industry. He was created cardinal in 1645, and in 1647 was made viceroy of Catalonia. In 1649 he was taken prisoner in the Battle of Rocroi (May 18) and was sent to the fortress of Perpignan (1644).

In 1663 Condé was appointed to command against the Spaniards in northern France. He was opposed by experienced generals, and the veterans of the Spanish army were considered the finest soldiers in Europe; on the other hand, the strength of the French army was placed at his command, and under him were the best generals of the service. The great battle of Rocroi (May 18) put an end to the supremacy of the Spanish army and inaugurated the long period of French military predominance. Condé himself conceived and directed the decisive attack, and at the age of twenty-two won his place amongst the greatest captains of modern times. After a campaign of uninterrupted success, Condé returned to Paris in triumph, and in gallantry and intrigues strove to forget his enforces and hateful marriage. In 1644 he was sent with reinforcements into Germany to the assistance of Turenne, who was hard pressed, and took command of the whole army. The battle of Freiburg (Aug.) was
desperately contested, but in the end the French army won a great victory over the Bavarians and Imperialists commanded by Count Mercy. As after Rocroy, numerous fortresses opened their gates to the duke. The next winter Enghien spent, like every other winter during the war, amid the gaities of Paris. The summer campaign of 1655 opened with the defeat of Paris by Mercy, but this was retrieved in the brilliant victory of Nördlingen, in which Mercy was killed, and Enghien himself received several serious wounds. The capture of Philipsburg was the most important of his other achievements during this campaign. In 1646 Enghien served under the duke of Orleans in Flanders, and when, after the capture of Mardyck, Orleans returned to Paris, Enghien, left in command, captured Dunkirk (October 11th).

It was in this year that the old prince of Condé died. The enormous power that fell into the hands of his successor was naturally looked upon with serious alarm by the regent and her minister. Condé’s birth and military renown placed him at the head of the French nobility; but, added to that, the family of which he was chief was both enormously rich and master of no small portion of France. Condé himself held Burgundy, Berry, and the Bouche, as well as other less important territory; his brother Conti held Champagne, and his younger brother, Longueville, Normandy. The government, therefore, determined to permit no increase of his already overgrown authority, and Mazarin made an attempt, which for the moment proved successful, at once to find him employment and to tarnish his fame as a general. He was sent to lead the revolted Catalans. Ill-supported, he was unable to achieve anything, and, being forced to raise the siege of Lerida, he returned home in bitter indignation. In 1648, however, he received the command in the important field of the Low Countries; and at Lens (Aug. 19th) a battle took place, which, beginning with a panic in his own regiment, was retrieved by Condé’s coolness and bravery, and ended in a victory that fully restored his prestige.

In September of the same year Condé was recalled to court, for the regent Anne of Austria required his support. Influenced by the fact of his royal birth and by his arrogant scorn for the bourgeois, Condé lent himself to the court party, and finally, after much hesitation, he consented to lead the army which was to reduce Paris (Jan. 1649).

On his side, insufficient as were his forces, the war was carried on with vigour, and after several minor combats their substantial losses and a threatening scarcity of food made the Parisians weary of the war. The political situation inclined both parties to peace, which was made at Rueil on the 20th of March (see Fromont, the). It was not long, however, before Condé became estranged from the court. His pride and ambition earned for him universal distrust and dislike, and the personal resentment of Anne in addition to motives of policy caused the sudden arrest of Condé, Conti and Longueville on the 18th of January 1650. But others, including Turenne and his brother the duke of Bouillon, made their escape. Vigorous attempts for the release of the princes began to be made. The women of the family were now its heroes. The dowager princess claimed from the parlement of Paris the fulfillment of the reformed law of arrest, which forbade imprisonment without trial. The duke of Longueville entered into negotiations with Spain; and the young princes of Condé, having gathered an army around her, obtained entrance into Bordeaux and the support of the parlement of that town. She alone, among the nobles who took part in the folly of the Fronde, gains our respect and sympathy. Faithful to a faithless husband, she came forth from the retirement to which he had condemned her, and gathered an army to fight for him. But the delivery of the princes was brought about in the end by the junction of the old Fronde (the party of the parlement and of Cardinal de Retz) and the new Fronde (the party of the Contés); and Anne was at last, in February 1651, forced to liberate them from their prison at Havre. Soon afterwards, however, another shifting of parties left Condé and the new Fronde isolated. With the court and the old Fronde in alliance against him, Condé found no resource but that of making common cause with the Spaniards, who were at war with France. The confused civil war which followed this step (Sept. 1651) was memorable chiefly for the battle of the Faubourg St Antoine, in which Condé and Turenne, two of the foremost captains of the age, measured their strength (July 2, 1652), and the army of the prince was only saved by a remission within the gates of Paris. La Grande Motaiselle, daughter of the duke of Orleans, persuaded the Parisians to act thus, and turned the cannon of the Bastille on Turenne’s army. Thus Condé, who as usual had fought with the most desperate bravery, was saved, and Paris underwent a new investment. This ended in the flight of Condé to the Spanish army (Sept. 1652), and thenceforth, up to the peace, he was in open arms against France, and held high command in the army of Spain. But his now fully developed genius as a commander found little scope in the cumbrous and antiquated system of war practised by the Spaniards, and though he gained a few successes, and manoeuvred with the highest possible skill against Turenne, his disastrous defeat at the Dunes near Dunkirk (14th of June 1658), in which an English contingent of Cromwell’s veterans took part on the side of Turenne, led Spain to open negotiations for peace. After the peace of the Pyrenees in 1659, Condé obtained his pardon (January 1660) from Louis, who, however, did not give him his public dignity, nor, as patron, as possessor of the independent sovereignty of Luxembourg, which had been offered him by Spain as a reward for his services.

Condé now realized that the period of agitation and party warfare was at an end, and he accepted, and, loyally maintained henceforward, the position of a chief subordinate to a masterful sovereign. Even so, some years passed before he was recalled to active employment, and these years he spent on his estate at Chantilly. Here he gathered round him a brilliant company, which included many men of genius—Molière, Racine, Bollœu, La Fontaine, Nicole, Bourdaloue and Bossuet. About this time negotiations between the Poles, Condé and Louis were carried on with a view to the election, at first of Condé’s son Enghien, and afterwards of Condé himself, to the throne of Poland. These, after a long series of curious intrigues, were finally closed in 1674 by the veto of Louis XIV. and the election of John Sobieski. The prince’s retirement, which was only broken by the Polish question and by his personal intercession on behalf of Fouquet in 1664, ended in 1668. In that year he proposed to Louvois, the minister of war, a plan for seizing Franche-Comté, the execution of which was entrusted to him and successfully carried out. He was now completely re-established in the favour of Louis, and with Turenne was the principal French commander in the celebrated campaign of 1672 against the Dutch. At the forcing of the Rhine passage at Tollhuis (June 12) he received a severe wound, after which he commanded in Alsace against the Imperialists. In 1673 he was again engaged in the Low Countries, and in 1674 he fought his last great battle at Senœuf against the prince of Orange (afterwards William III. of England). This battle, fought on the 11th of August, was one of the hardest of the century, and Condé, who displayed the reckless bravery of his youth, had three horses killed under him. His last campaign was that of 1675 on the Rhine, where the army had been deprived of its general by the death of Turenne; and where by his careful and methodical strategy he repelled the invasion of the Imperial army of Montecuccoli. After this campaign, prematurely worn out by the toils and excesses of his life, and tortured by gout, he returned to Chantilly, where he spent the eleven years that remained to him in quiet retirement. In the end of his life he specially sought the companionship of Bourdoloue, Nicole and Bossuet, and devoted himself to religious exercises. He died on the 11th of November 1686 at the age of sixty-five. Bourdoloue attended him at his death-bed, and Bossuet pronounced his effigies. The earlier political career of Condé was typical of the great French noble of his day. Success in love and war, predominant influence over his sovereign and universal homage to his own exaggerated pride, were the objects of his ambition. Even as an exile he asserted the precedence of the royal house of France over the princes of Spain and Austria, with whom he was allied for the moment. But the Condé of 1668 was no longer a politician.
CONDE—CONDENSATION OF GASES

and a marplot; to be first in war and in gallantry was still his aim, but for the rest he was a submissive, even a subservient, minister of the royal will. It is on his military character, however, that his fame rests. This changed but little. Unlike his great rival Turenne, Condé was equally brilliant in his first battle and in his last. The one failure of his generalship was in the Spanish Fronde, and in this everything united to thwart his genius; only on the battlefield itself was his personal leadership as conspicuous as ever. That he was capable of waging a methodical war of positions may be assumed from his campaigns against Turenne and Montecuccoli, the greatest generals of the predominant school. But it was in his eagerness for battle, his quick decision in action, and the stern will which sent his regiments to face the heaviest loss, that Condé is distinguished above all the generals of his time. In private life he was harsh and unamiable, seeking only the gratification of his own pleasures and desires. His enforced and loveless marriage embittered his life, and it was only in his last years, when he had done with ambition, that the more humane side of his character appeared in his devotion to literature.

Condé's unhappy wife had some years before been banished to Château-Roux. An accident brought about her ruin. Her contemporaries, greedy as they were of scandal, refused to believe any evil of her, but the prince declared himself convinced of her unfaithfulness, placed her in confinement, and carried his resentment so far that his last letter to the king was to request him never to allow her to be released.

AUTHORITIES.—See, besides the numerous Mémoires of the time, Puget de la Serre, Les Sièges, les batailles, &c., &c., of Mr. le prince de Condé (Paris, 1651); J. de la Brune, Histoire de la, &c., &c., of Louis de Bourbon (Paris, 1684); P. Coste, Histoire de Louis de Bourbon, &c. (Hague, 1748); Desormeaux, Histoire de Louis de Bourbon, &c. (Paris, 1768); Turpin, Vie de Louis de Bourbon, &c. (Paris and Amsterdam, 1675); Elie militaire de Louis de Bourbon, &c. (Paris, 1697); Bion, Histoire et Condé, by A. Lemercier (Tours, 1862); J. E. Roy (Lille, 1859); L. de Vouville (Tours, 1846); Fitzpatrick, The Great Condé, and Lord Mahon, Life of Louis, prince de Condé (London, 1845). Works on the Condé family by the prince de Condé and de Sevillages (Paris, 1820), the duc d'Aumale, and without Rouen, 1868), show in their parts important, preserves one of its parish churches, with a fine Romanesque tower. The two towns are:

1. Condé-sur-l’Escaut, in the department of Nord, at the junction of the canals of the Scheldt and of Condé-Mons. Pop. (1906) town, 2701; commune, 5310. It lies 7 m. N. by E. of Valenciennes and 2 m. from the Belgian frontier. It has a church dating from the middle of the 13th century. Trade is in coal and canvas. Condé-sur-l’Escaut includes the town, the suburb building, and there is a communal college. Condé (Condate) is of considerable antiquity, dating at least from the later Roman period. Taken in 1676 by Louis XIV., it definitely passed into the possession of France by the treaty of Nijmegen two years later, and was afterwards fortified by Vauban. During the revolutionary war it was besieged and taken by the Austrians (1793); and in 1815 it again fell to the allies. It was from this place that the princes of Condé (q.v.) took their title. See Perron-Gelineau, Condé ancien et moderne (Nantes, 1887).

2. Condé-sur-Noireau, in the department of Calvados, at the confluence of the Noireau and the Douvres, 33 m. S.S. of Caen on the Ouest-État railway. Pop. (1906) 5790. The town is the seat of a tribunal of commerce, a board of trade-arbitration and a chamber of arts and manufactures, and has a communal college. It is important for its cotton spinning and weaving, and carries on dyeing, printing and machine-construction; there are numerous nursery-gardens in the vicinity. Important fairs are held in the town. The church of St Martin has a choir of the 12th and 15th centuries, and a stained-glass window (15th century) representing the Crucifixion. There is a statue to Dumont d’Urvil, the navigator (b. 1790), a native of the town. Throughout the middle ages Condé (Condatem, Condetum) was the seat of an important castellany, which was held by a long succession of powerful nobles and kings, including Robert, count of Mortain, Henry II. and John of England, Philip Augustus of France, Charles II. (the Bad) and Charles III. of Navarre. The place was held by the English from 1417 to 1449. Of the castle some ruins of the keep survive. See L. Huet, Hist. de Condé-sur-Noireau, ses seigneurs, son industrie, &c. (Caen, 1885).

CONDE, JOSE ANTONIO (1766–1820), Spanish Orientalist, was born at Peraleja (Cuenca) on the 28th of October 1766, and was educated at the university of Alcalá. His translation of Anacreon (1791) obtained him a post in the royal library in 1795, and in 1796–1797 he published parables from Theocritus, Bion, Moschus, Sappho and Meleager. These were followed by a mediocre edition of the Arabic text of Edrisi’s Description of Spain (1799), with notes and a translation. Condé became a member of the Academy of History in 1802 and of the Academy of History in 1804, but his appointment as interpreter to Joseph Bonaparte led to his expulsion from both bodies in 1814. He escaped to France in February 1813, and returned to Spain in 1814, but was not allowed to reside at Madrid till 1816. Two years later he was re-elected by both academies; he died in poverty on the 12th of June 1820. His Historia de la Dominación de los árabes en España was published in 1820–1821. Only the first volume was corrected by the author, the other two were compiled from his manuscript by Juan Tineo. This was translated into German (1824–1825), French (1825) and English (1854). Condé’s pretensions to scholarship have been severely criticized by Dozy, and his history is now discredited. It had, however, the merit of stimulating abler workers in the same field.

CONDENSATION OF GASES. If the volume of a gas continuously decreases at a constant temperature, for which an increasing pressure is required, two cases may occur:

1. The volume may continue to be homogeneously filled.
2. (1) If the substance be contained in a certain volume, and if the pressure has a certain value, the substance may divide into two different phases, each of which is again homogeneously. The value of the temperature T determines which case will occur. The temperature which is the limit above which the space will always be homogeneously filled, and below which the substance divides into two phases, is called the critical temperature of the substance. It differs greatly for different substances, and if we represent it by Tc, the condition for the condensation of a gas is that T must be below Tc. If the substance is divided into two phases, different cases may occur. The denser phase may be either a liquid or a solid. The limiting temperature for these two cases, at which the division into three phases may occur, is called the triple point. Let us represent it by T0; if the term ‘condensation of a gas’ is taken in the sense of ‘liquefaction of a gas’, which is usually understood, the critical temperature for the gas is Tc > T0. The opinion sometimes held that for all substances T0 is the same fraction of Tc (the value being about 3⁄4) has decidedly not been rigorously confirmed. Nor is this to be expected on account of the very different form of crystallization which the solid state presents. Thus for carbon dioxide, CO2, for which Tc = 304° on the absolute scale, and for which we may put T0 = 216°, this fraction is about 0.7; for water it descends down to 0.42, and for other substances it may be still lower.

If we confine ourselves to temperatures between Tc and T0, the gas will pass into a liquid if the pressure is sufficiently increased. When the formation of liquid sets in we call the gas a saturated vapour. If the decrease of volume is continued, the gas pressure remains constant till all the vapour has passed into liquid. The invariability of the properties of the phases is in close connexion with the invariability of the pressure (called maximum tension). Throughout the course of the process of condensation these properties remain unchanged, provided the temperature remain
CONDUCTION OF GASES

Sydney Young, this holds good with a high degree of approximation for a long series of substances. Important deviations from this rule for the values of \( v_i/v_0 \) are only found for those substances in which the existence of association has already been surmised by other methods. Since the lowest value of \( T_0 \) for which investigations on \( v_i \) and \( v_0 \) may be made, is the value of \( T_1 \); and since \( T_0/T_1 \), as has been observed above, is not the same for all substances, we cannot expect the smallest value of \( v_i/v_0 \) to be the same for all substances. But for low values of \( T_1 \), viz. such as are near \( T_1 \), the influence of the temperature on the volume is but slight, and therefore we are not far from the truth if we assume the minimum value of the ratio \( v_i/v_0 \) as being identical for all normal substances, and put it at \( \frac{2}{3} \). Moreover, the influence of the polymerization (association) on the liquid volume appears to be small, so that we may even attribute the value \( \frac{2}{3} \) to substances which are not normal. The value of \( v_i/v_0 \) at \( T_1 \) differs widely for different substances. If we take \( v_i \) so low that the law of Boyle-Gay-Lussac may be applied, we can calculate \( v_i/v_0 \) by means of the formula

\[
\frac{v_i}{v_0} = k \frac{1}{T}.
\]

provided \( k \) be known. According to the observations of Sydney Young, this factor has proved to be \( 2 \cdot 77 \) for normal substances.

In consequence \( 2 \cdot 77 = 3 \cdot 77 \cdot 3 \cdot 7 \cdot 2 \cdot 31 \frac{T_0}{v_0} \). A similar formula, but with another value of \( k \), may be given for associating substances, provided the saturated vapour does not contain any complex molecules. But if it does, as is the case with acetic acid, we must also know the degree of association. It can, however, only be found by measuring the volume itself.

E. Mathias has remarked that the following relation exists between the densities of the saturated vapour and of the coexisting liquid:

\[
\rho_i + \rho_0 = \rho_0 \left\{ 1 + \frac{T - T_0}{\rho_0} \right\}.
\]

and that, accordingly, the curve which represents the densities at different temperatures possesses a rectilinear diameter. According to the law of corresponding states, \( a \) would be the same for all substances. Many substances, indeed, actually appear to have a rectilinear diameter, and the value of \( a \) appears approximately to be the same. In a Mémoire présenté à la société royale de Liège, 15th June 1899, E. Mathias gives a list of some twenty substances for which \( a \) has a value lying between 0-95 and 1-05. It had been already observed by Sydney Young that \( a \) is not perfectly constant even for normal substances. For associating substances the diameter is not rectilinear. Whether the value of \( a \), near 1, may serve as a characteristic for normal substances is rendered doubtful by the fact that for nitrogen \( a \) is found equal to 0-6813 and for oxygen to 0-8. At \( T = T_0/2 \), the formula of E. Mathias, if \( \rho_0 \) be neglected with respect to \( \rho_i \), gives the value 2-1\( a \) for \( \rho_0/\rho_i \).

The heat required to convert a molecular quantity of liquid coexisting with vapour into saturated vapour at the same temperature is called molecular latent heat. It decreases with the rise of the temperature, because at a higher temperature the liquid has already expanded, and because the vapour into which it has to be converted is denser. At the critical temperature it is equal to zero on account of the identity of the liquid and the gaseous states. If we call the molecular weight \( m \) and the latent heat per unit of weight \( r \), then, according to the law of corresponding states, \( mr/T \) is the same for all normal substances, provided the temperatures are corresponding. According to F. T. Trouton, the value of \( mr/T \) is the same for all substances if we take for \( T \) the boiling-point. As the boiling-points under the pressure of one atmosphere are generally not equal fractions of \( T_0 \), the two theorems are not identical; but as the values of \( \rho_0 \) for many substances do not differ so much as to make the ratios of the boiling-points under the pressure of one atmosphere differ greatly from the ratios of \( T_0 \), an approximate confirmation of the law of Trouton may be compatible with an approximate confirmation of the consequence of the law of corresponding states. If we take the term boiling-point in a more general sense, and put \( T \) in the law of

constant; only the relative quantity of the two phases changes. Until all the gas has passed into liquid a further decrease of volume will not require increase of pressure. But as soon as the liquefaction is complete a slight decrease of volume will require a great increase of pressure, liquids being but slightly compressible.

The pressure required to condense a gas varies with the temperature, becoming higher as the temperature rises. The highest pressure will therefore be found at \( T_0 \) and the lowest at \( T_1 \). We shall represent the pressure at \( T_0 \) by \( p_0 \). It is called the critical pressure. The pressure at \( T_1 \) we shall represent by \( p_1 \). It is called the pressure of the triple point. The values of \( T_0 \) and \( p_0 \) for different substances will be found at the end of this article. The values of \( T_0 \) and \( p_0 \) are accurately known only for a few substances. As a rule \( p_0 \) is small, though occasionally it is greater than 1 atmosphere.

This is the case with CO\(_2\), and we may in general expect it if the value of \( T_0/T_1 \), is large. In this case there can only be a question of a real boiling-point (under the normal pressure) if the liquid can be supercooled.

We may find the value of the pressure of the saturated vapour, for each \( T \) in a geometrical way by drawing in the theoretical isothermal a straight line parallel to the \( v \)-axis in such a way that \( \int_{v_0}^{v_i} p \, dv \) will have the same value whatever the straight line or the theoretical isothermal is followed. This construction, given by James Clerk Maxwell, may be considered as a result of the application of the general rules for coexisting equilibrium, which we owe to J. Willard Gibbs. The construction derived from the rules of Gibbs is as follows:—Construe the free energy at a constant temperature, i.e. the quantity \( -p \, dv = \omega \, dv \) as ordinate, if the abscissa represents \( v \), and determine the inclination of the double tangent. Another construction derived from the rules of Gibbs might be expressed as follows:—Construe the value of \( p \) at \( v_0 \) as ordinate, the abscissa representing \( v \), and determine the point of intersection of two of the three branches of this curve.

As an approximate half-empirical formula for the calculation of the pressure, \( -\log_{10} p_0 = \int \frac{1}{T} \frac{T}{T_0} \) may be used. It would follow from the law of corresponding states that in this formula the value of \( f \) is the same for all substances, the molecules of which do not associate to form larger molecule-complexes. In fact, for a great many substances, we find a value for \( f \), which differs but little from 3, e.g. ether, carbon dioxide, benzene, benzene derivatives, ethyl chloride, ethane, &c. As the chemical structure of these substances differs greatly, and association, if it takes place, must largely depend upon the structure of the molecule, we conclude from this approximate equality that the fact of this value of \( f \) being equal to about 3 is characteristic for normal substances in which, consequently, association is excluded. Substances known to associate, such as organic acids and alcohols, have a sensibly higher value of \( f \). Thus T. Estreicher (Cracow, 1873) calculates that for fluoro-benzene \( f \) varies between 3-07 and 2-94; for ether between 3-9 and 3-1; but for water between 3-2 and 3-33, and for methyl alcohol between 3-65 and 3-84, &c. For isolobal alcohol \( f \) even rises above 4. It is, however, remarkable that for oxygen \( f \) has been found almost invariably equal to 2-47 from K. Olszewski's observations, a value which is appreciably smaller than 3. This fact makes us again seriously doubt the correctness of the supposition that \( f = 3 \) is a characteristic for non-association.

It is a general rule that the volume of saturated vapour decreases when the temperature is raised, while that of the coexisting liquid increases. We know only one exception to this rule, and that is the volume of water below \( 3^\circ \). If we call the liquid volume \( v_1 \), and the vapour \( v_0 \), \( v_0 - v_1 \) decreases if the temperature rises, and becomes zero at \( T_0 \). The limiting value, to which \( v_1 \) and \( v_0 \) converge at \( T_0 \), is called the critical volume, and we shall represent it by \( v_0 \).

According to the law of corresponding states the values both of \( v_0/v_1 \) and \( v_0/v_0 \) must be the same for all substances, if \( T_0/T_1 \), has been taken equal for them all. According to the investigations of
CONDENSATION OF GASES

Trouton to represent the boiling-point under an arbitrary equal pressure, we may take the pressure equal to \( p_1 \) for a certain substance. For this substance \( m \rho_r / T \) would be equal to zero, and the values of \( m \rho_r / T \) would always show a trace of equality. At present direct trustworthy investigations about the value of \( r \) for different substances are wanting; hence the question whether as to the quantity \( m \rho_r / T \) the substances are to be divided into normal and associating ones cannot be answered. Let us divide the latent heat into heat necessary for internal work and heat necessary for external work. Let \( r' \) represent the former of these two quantities, then:

\[
r = r' + (p - \rho r)
\]

Then the same remark holds good for \( m \rho_r / T \) as has been made for \( m \rho / T \). The ratio between \( r \) and that part that is necessary for external work is given in the formula:

\[
\frac{r}{p(\rho n - \rho v)} = \frac{T}{\rho \frac{\partial p}{\partial T}}
\]

By making use of the approximate formula for the vapour tension:

\[
\log \rho = f' \left( \frac{T_r - T}{T} \right)
\]

we find:

\[
\frac{r}{p(\rho n - \rho v)} = f'' \frac{T_r}{T}
\]

At \( T = T_r \) we find for this ratio \( f' \), a value which, for normal substances is equal to \( 3 \omega / 43.43 = \gamma \). At the critical temperature the quantities \( r \) and \( \rho v - \rho v \) are both equal to 0, but they have a finite ratio. As we may equate \( p(\rho n - \rho v) \) with \( p_0 = RT \) at very low temperatures, we get, if we take into consideration that \( R \) expressed in calories is nearly equal to \( \frac{2}{m} \), the value \( f'' T = 14 T \), as limiting value for \( m \rho_r / T \) for normal substances. This value for \( m \rho_r \) has, however, merely the character of a rough approximation—especially since the factor \( f' \) is not perfectly constant.

All the phenomena which accompany the condensation of gases into liquids may be explained by the supposition, that the condition of aggregation which we call liquid differs only in quantity, and not in quality, from that which we call gas. We imagine a gas to consist of separate molecules of a certain mass \( \mu \), having a certain velocity depending on the temperature. This velocity is distributed according to the law of probabilities, and furnishes a quantity of \( v s \), proportional to the temperatures. We must attribute extension to the molecules, and they will attract one another with a force which quickly decreases with the distance. Even those suppositions which reduce molecules to centra of forces, like that of Maxwell, lead us to the result that the molecules behave in mutual collisions as if they had extension—an extension which in this case is not constant, but determined by the law of repulsion in the collision, the law of the distribution, and the value of the velocities. In order to explain capillary phenomena it was assumed so early as Laplace, that between the molecules of the same substance an attraction exists which quickly decreases with the distance. That this attraction is found in gases too is proved by the fall which occurs in the temperature of a gas that is expanded without performing external work. We are still perfectly in the dark as to the cause of this attraction, and opinion differs greatly as to its dependence on the distance. Nor is this knowledge necessary in order to find the influence of the attraction, for a homogeneous state, on the value of the external pressure which is required to keep the moving molecules at a certain volume (\( T \) being given). We may, viz., assume either in the strict sense, or as a first approximation, that the influence of the attraction is quite equal to a pressure which is proportional to the square of the density. Though this molecular pressure is small for gases, yet it will be considerable for the great densities of liquids, and calculation shows that we may estimate it at more than \( 1000 \text{ atm} \), possibly increasing up to \( 10,000 \). We may now make the same supposition for a liquid as for a gas, and imagine it to consist of molecules, which for non-associating substances are the same as those of the rarefied vapour; these, if \( T \) is the same, have the same mean \( v s \) as the vapour molecules, but are more closely massed together. Starting from this supposition and all its consequences, van der Waals derived the following formula, which would hold both for the liquid state and for the gaseous state:

\[
(p + \frac{a}{v^2}) (v - b) = RT.
\]

It follows from this deduction that for the rarefied gaseous state \( b \) would be four times the volume of the molecules, but that for greater densities the factor \( a \) would decrease. If we represent the volume of the molecules by \( \beta \), the quantity \( b \) will be found to have the following form:

\[
b = 4 \beta \left( 1 - \gamma_n \left( \frac{\alpha \beta}{\gamma} \right)^2 \right) + \gamma \left( \frac{\alpha \beta}{\gamma} \right)^2 \text{etc.}
\]

Only two of the successive coefficients \( \gamma_1, \gamma_2, \text{etc.} \) have been worked out, for the determination requires very lengthy calculations, and has not even led to definitive results (L. Boltzmann, Proc. Royal Acad. Amsterdam, March 1890). The latter formula supposes the molecules to be rigid spheres of invariable size. If the molecules are things which are compressible, another formula for \( b \) is found, which is different according to the number of atoms in the molecule (Proc. Royal Acad. Amsterdam, 1900–1901). If we keep the value of \( a \) and \( b \) constant, the given equation will not completely represent the net of isothermals of a substance. Yet even in this form it is sufficient as to the principal features. From it we may argue to the existence of a critical temperature, to a minimum value of the product \( p v \) to the law of corresponding states, &c. Some of the numerical results to which it leads, however, have not been confirmed by experience. Thus it would follow from the given equation that \( \frac{p^2 \rho}{T} = \frac{3}{8} \), if the value of \( v \) is taken so great that the gaseous laws may be applied, whereas Sydney Young has found \( \alpha \beta = 1/3.77 \) for a number of substances instead of the factor \( 3/8 \). Again it will follow from the given equation, that if \( a \) is thought to be independent of the temperature, \( \frac{T_n}{T} \left( \frac{\partial p}{\partial T} \right)_n = 4 \), whereas for a number of substances a value is found for which it is near \( 7 \). If we assume with Clausius that \( a \) depends on the temperature, and has a value \( \alpha \beta = 0.273 \), then we find \( \frac{T_n}{T} \left( \frac{\partial p}{\partial T} \right)_n \approx 7 \).

That the accurate knowledge of the equation of state is of the highest importance is universally acknowledged, because, in connexion with the results of thermodynamics, it will enable us to explain all phenomena relating to ponderable matter. This general conviction is shown by the numerous efforts made to complete or modify the given equation, or to replace it by another, for instance, by R. Clausius, P. G. Tait, E. H. Amagat, L. Boltzmann, T. G. Jager, C. Dieterici, B. Galitzine, T. Rose Innes and M. Reinganum.

If we hold to the supposition that the molecules in the gaseous and the liquid state are the same—which we may call the supposition of the identity of the two conditions of aggregation—then the heat which is given out by the condensation at constant \( T \) is due to the potential energy lost in consequence of the coming closer of the molecules which attract each other, and then it is equal to \( \frac{1}{(1 - \frac{1}{\gamma_n})} \). If \( a \) should be a function of the temperature, it follows from thermodynamics that it would be equal to \( a - T \left( \frac{da}{dT} \right) \frac{1}{(1 - \frac{1}{\gamma_n})} \). Not only in the case of liquid and gas, but always when the volume is diminished, a quantity of heat is given out equal to \( a - T \left( \frac{da}{dT} \right) \frac{1}{(1 - \frac{1}{\gamma_n})} \).

If, however, when the volume is diminished at a given temperature, and also during the transition from the gaseous to the liquid state, combination into larger molecule-complexes takes place, the total internal heat may be considered as the sum of that which is caused by the combination of the molecules into greater molecule-complexes and by their approach towards each other. We have the simplest case of possible greater complexity when two molecules combine to one. From the course of the changes in the density of the vapour we assume that this occurs, e.g. with nitrogen peroxide, NO₂, and acetic acid, and the somewhat close agreement of the
observed density of the vapour with that which is calculated from the hypothesis of such an association to double-molecules, makes the supposition almost a certainty. In such cases the molecules in the much denser liquid state must therefore be considered as double-molecules, either completely so or in a variable degree depending on the temperature. The given equation of state cannot hold for such substances. Even though we assume that \( a \) and \( b \) are not modified by the formation of double-molecules, yet \( RT \) is modified, and, since \( s \) is proportional to the number of the molecules, is diminished by the combination. The laws found for normal substances will, therefore, not hold for such associating substances. Accordingly for substances for which we have already found an abnormal density of the vapour, we cannot expect the general laws for the liquid state, which have been treated above, to hold good without modification, and in many respects such substances will therefore not follow the law of corresponding states. There are, however, also substances of which the abnormal density of vapour has not been stated, and which yet cannot be ranged under this law, e.g. water and alcohols. The most natural thing, of course, is to regard the deviation from the above substances, as of the others, to the fact that the molecules of the liquid are polymerized.

In this case we have to account for the following circumstance, that whereas for \( \text{NO}_2 \) and acetic acid in the state of saturated vapour the degree of association increases if the temperature falls, the reverse must take place for water and alcohols. Such a difference may be accounted for by the difference in the quantity of heat released by the polymerization to double-molecules or larger molecule-complexes. The quantity of heat given out when two molecules fall together may be calculated for \( \text{NO}_2 \) and acetic acid from the formula of Gibbs for the density of vapour, and it proves to be very considerable. With this the following fact is closely connected. If in the \( pv \) diagram, starting from a point indicating the state of saturated vapour, a geometrical locus is drawn of the points which have the same degree of association, this curve, which passes towards isothermals of higher \( T \) if the volume diminishes, requires for the same change in \( T \) a greater diminution of volume than is indicated by the border-curve. For water and alcohols this geometrical locus will be found on the other side of the border-curve, and the polymerization heat will be small, i.e. smaller than the latent heat. For substances with a small polymerization heat the degree of association will continually decrease if we move along the border-curve on the side of the saturated vapour in the direction towards lower \( T \). With this, it is perfectly compatible that for such substances the saturated vapour, e.g. under the pressure of one atmosphere, should show an almost normal density. Saturated vapour of water at \( 100^\circ \) has a density which seems nearly 4% greater than the theoretical one, an amount which is greater than can be ascribed to the deviation from the gas-laws. For the relation between \( v, T \), and \( x \), if \( x \) represents the fraction of the number of double-molecules, the following formula has been found ("Molekulartheorie," Zeits. Phys. Chem., 1890, vol. 1):

\[
\log \frac{\alpha (1-x)^{2} - 2 \alpha E_{1} - E_{2}}{R \alpha T} = C,
\]

from which

\[
\frac{T}{v-b} - \frac{d\alpha}{dT} = \frac{-2 \alpha E_{1} - E_{2}}{R \alpha T},
\]

which may elucidate what precedes.

By far the majority of substances have a value of \( T_{c} \) above the ordinary temperature, and diminution of volume (increase of pressure) is sufficient to condense such gaseous substances into liquids. If \( T_{c} \) is but little above the ordinary temperature, a great increase of pressure is in general required to effect condensation. Substances for which \( T_{c} \) is much higher than the ordinary temperature \( T_{b} \), e.g. \( T_{c} > \frac{3}{4} T_{b} \), occur as liquids, even without increase of pressure; that is, at the pressure of one atmosphere. The value \( \frac{3}{4} \) is to be considered as only a mean value, because of the inequality of \( p_{c} \). The substances for which \( T_{c} \) is smaller than the ordinary temperature are but few in number. Taking the temperature of melting ice as a limit, these gases are in successive order: \( \text{CH}_{4}, \text{NO}, \text{O}_{2}, \text{CO}, \text{N}_{2}, \text{H}_{2} \) (the recently discovered gases argon, helium, \&c., are left out of account). If these gases are compressed at \( 0^\circ \) centigrade they do not show a trace of liquefaction, and therefore they were long known under the name of "permanent gases." The discovery, however, of the critical temperature carried the conviction that these substances would not be "permanent gases" if they were compressed at much lower \( T \). Hence the problem arose how "low temperatures" were to be brought about. Considered from a general point of view the means to attain this end may be described as follows: we must make use of the above-mentioned circumstance that heat disappears when a substance expands, either with or without performing external work. According as this heat is derived from the substance itself which is to be condensed, or from the substance which is used as a means of cooling, we may divide the methods for condensing the so-called permanent gases into two principal groups.

In order to use a liquid as a cooling bath it must be placed in a vacuum, and it must be possible to keep the pressure of the vapour in that space at a small value. Accordingly to the boiling-law, the temperature of the liquid must descend to that at which the maximum tension of the vapour is equal to the pressure which reigns on the surface of the liquid. If the vapour, either by means of absorption or by an air-pump, is exhausted from the space, the temperature of the liquid and that of the space itself depend upon the value of the pressure which finally prevails in the space. From a practical point of view the value of \( T_{c} \) may be regarded as the limit to which the temperature falls. It is true that if the air is exhausted to the utmost possible extent, the temperature may fall still lower, but when the substance has become solid, a further diminution of the pressure in the space is of little advantage. At any rate, as a solid body evaporates only on the surface, and solid gases are bad conductors of heat, further cooling will only take place very slowly, and will scarcely neutralize the influx of heat. If the pressure \( p_{b} \) is very small, it is perhaps practically impossible to reach \( T_{c} \) if so, \( T_{c} \) in the following lines will represent the temperature practically attainable. There is thus for every gas a limit below which it is not to be cooled further, at least not in this way. If, however, we can find another gas for which the critical temperature is sufficiently above \( T_{c} \) of the first chosen gas, and if it is converted into a liquid by cooling with the first gas, and then treated in the same way as the first gas, it may in its turn be cooled down to \( (T_{b})_{0} \). Going on in this way, continually lower temperatures may be attained, and it would be possible to condense all gases, provided the difference of the successive critical temperatures of two gases fulfills certain conditions. If the ratio of the absolute critical temperatures for two gases, which succeed one another in the series, should be sensibly greater than \( 2 \), the value of \( T_{c} \) for the first gas is not, or not sufficiently, below the \( T_{c} \) of the second gas. This is the case when one of the gases is nitrogen, on which hydrogen would follow as second gas. Generally, however, we shall take in the atmosphere air instead of nitrogen. Though this mixture of \( \text{N}_{2} \) and \( \text{O}_{2} \) will condense in other phenomena than a simple substance, yet we shall continue to speak of a \( T_{c} \) for air, which is given at \( -140^\circ \) C., and for which, therefore, \( T_{c} \) amounts to \( 133^\circ \) absolute. The lowest \( T_{c} \) which may be expected for air in a highly rarified space may be evaluated at \( 60^\circ \) absolute—a value which is higher than the \( T_{c} \) for hydrogen. Without new contrivances it would, accordingly, not be possible to reach the critical temperature of \( \text{H}_{2} \). The method by which we try to obtain successively lower temperatures by making use of successive gases is called the "cascade method." It is not self-evident that by sufficiently diminishing the pressure on a liquid it may be cooled to such a degree that the temperature will be lowered to \( T_{c} \), if the initial temperature was equal to \( T_{c} \), or but little below it, and we can even predict with certainty that this will not be the case for all substances. It is possible, too, that long before the triple point is reached the whole will have evaporated. The most favourable conditions will of
CONDENSATION OF GASES

course, be attained when the influx of heat is reduced to a minimum. As a limiting case we imagine the process to be isentropic. Now the question has become, Will an isentropic line, which starts from a point of the border-curve on the side of the point not far from the critical-point, remain throughout its descending course in the heterogeneous region, or will it leave the region on the side of the vapour? As early as 1878 van der Waals (Verslagen Kon. Akad. Amsterdam) pointed out that the former may be expected to be the case only for substances for which $c_p/c_v$ is large, and the latter for those for which it is small; in other words, the former will take place for substances the molecules of which contain few atoms, and the latter for substances the molecules of which contain many atoms. Ether is an example of the latter class, and if we say that the quantity $h$ (specific heat of the saturated vapour) for ether is found to be positive, we state the same thing in other words.

It is not necessary to prove this theorem further here, as the molecules of the gases under consideration contain only two atoms and the total evaporation of the liquid is not to be feared.

In the practical application of this cascade-method some variation is found in the gases chosen for the successive stages. Thus methyl chloride, ethylene and oxygen are used in the cryogenic laboratory of Leiden, while Sir James Dewar has used air as the last term. Carbonic acid is not to be recommended on account of the comparatively high value of $T$. In order to prevent loss of gas a system of observation is employed.

This method of total-flow at low temperatures is decidedly laborious, and requires very intricate apparatus, but it has the great advantage that very constant low temperatures may be obtained, and can be regulated arbitrarily within pretty wide limits.

In order to lower the temperature of a substance down to $T_s$, it is not always necessary to convert it first into the liquid state by means of another substance, as was assumed in the last method for obtaining low temperatures. Its own expansion is sufficient, provided the initial condition be properly chosen, and provided we take care, even more than in the former method, that there is no influx of heat. Those conditions being fulfilled, we may, simply by adiabatic expansion, not only lower the temperature of some substances down to $T_s$, but also convert them into the liquid state. This is especially the case with substances the molecules of which contain few atoms.

Let us imagine the whole net of isothermals for homogeneous phases drawn in a $p$ vs $v$ diagram, and in it the border-curve. Within this border-curve, as in the heterogeneous region, the theoretical part of every isothermal must be replaced by a straight line. The isothermals may therefore be divided into two groups, viz., those which keep outside the heterogeneous region, and those which cross this region. Hence an isothermal, belonging to the latter group, enters the heterogeneous region on the liquid side, and leaves it at the same level on the vapour side. Let us imagine in the same way all the isentropic curves drawn for homogeneous states. Their form resembles that of isothermals in so far as they show a maximum and a minimum, if the entropy constant is below a certain value, while if it is above this value, both the maximum and the minimum disappear, the isentropic line in a certain point having at the same time $\frac{dp}{dv}$ and $\frac{dp}{dv} = 0$ for this particular value of the constant. This point, which we might call the critical point of the isentropic lines, lies in the heterogeneous region, and therefore cannot be realized, since as soon as an isentropic curve enters this region its theoretical part will be replaced by an empiric part. If an isentropic curve crosses the heterogeneous region, the point where it enters this region must, as just as for the isothermals, be connected with the point where it leaves the region by another curve. When $c_p/c_v = k$ (the limiting value of $c_p/c_v$ for infinite rarefaction is meant) approaches unity, the isentropic curves approach the isothermals and vice versa. In the same way the critical point of the isentropic curves comes nearer to that of the isothermals. And if $k$ is not much greater than 1, e.g., $k < 1.08$, the following property of the isothermals is also preserved, viz., that an isentropic curve, which enters the heterogeneous region on the side of the liquid, leaves it again on the side of the vapour, not of course at the same level, but at a lower point. If, however, $k$ is greater, in particular if it is so great as it is with molecules of two atoms or less, the isentropic curve, which enters on the side of the liquid, however far prolonged, always remains within the heterogeneous region.

But in this case all isentropic curves, if sufficiently prolonged, will enter the heterogeneous region. Every isentropic curve has one point of intersection with the border-curve, but only a small group intersect the border-curve in three points, two of which are to be found not far from the top of the border-curve and on the side of the vapour. Whether the sign of $h$ (specific heat of the saturated vapour) is negative or positive, is closely connected with the preceding facts. For substances having $h$ great, $h$ will be negative if $T$ is low, positive if $T$ rises, while it will change its sign again if $T_s$ is reached. The values of $T_s$ at which change of sign takes place, depend on $k$. The law of corresponding states holds good for this value of $T_s$ for all substances which have the same value of $k$.

Now the gases which were considered as permanent are exactly those for which $k$ has a high value. From this it would follow that every adiabatic expansion, provided it be sufficiently continued, will bring such substances into the heterogeneous region, i.e., they can be condensed by adiabatic expansion. But since the final pressure must not fall below a certain limit, determined by experimental convenience, and since the quantity which passes into the liquid state must remain a fraction as large as possible, and since the expansion never can be the place in such a manner that no heat is given out by the walls of the surroundings, it is best to choose the initial condition in such a way that the isentropic curve of this point cuts the border-curve in a point on the side of the liquid, lying as low as possible. The border-curve being rather broad at the top, there are many isentropic curves which penetrate the heterogeneous region under a pressure which differs but little from $p$.$\omega$. Availing himself of this property, K. Olszewski has determined $p$ for hydrogen at 15 atmospheres. Isentropic curves, which lie on the right and on the left of this group, will show a point of condensation at a lower pressure. Olszewski has investigated this for those lying on the right, but not for those on the left.

From the equation of state $(p + \frac{a^2}{v^2})(v - b) = RT$, the equation of the isentropic curve follows as $(p + \frac{a^2}{v^2})(v - b)^k = C$, and from this we may deduce $T(v - b)^{k-1} = C'$. This latter relation shows in how high a degree the cooling depends on the amount, by which $k$ surpasses unity, the change in $v - b$ being the same.

What has been said concerning the relative position of the border-curve and the isentropic curve may be easily tested for points of the border-curve which represent rarefied gaseous states, in the following way. Following the border-curve we found before $\frac{T p}{dT}$ for the value of $\frac{T dp}{dT}$. Following the isentropic curve the value of $\frac{T dp}{dT}$ is equal to $k\frac{T}{k-1}$. If $k < \frac{T}{k-1} < \frac{T}{k-1}$ the isentropic curve rises more steeply than the border-curve. If we take $f = 7$ and choose the value of $T / 2$ for $T$—a temperature at which the saturated vapour may be considered to follow the gas-laws—then $k(1 - k) = 1.14$, or $k = 1.07$ would be the limiting value for the two cases. At any rate $k = 1.07$ is great enough to fulfill the condition, even for other values of $T_s$. Cuillellet and Picet have availed themselves of this adiabatic expansion for condensing some permanent gases, and it must also be used when, in the cascade method, $T_s$ of one of the gases lies above $T_s$ of the next.

A third method of condensing the permanent gases is applied in C. P. G. Linde’s apparatus for liquefying air. Under a high pressure $p_1$ a current of gas is conducted through a narrow spiral, returning through another spiral which surrounds the first. Between the end of the first spiral and the beginning of the second the current of gas is reduced to a much lower pressure $p_2$ by passing through a fine
orifice. On account of the expansion resulting from this sudden decrease of pressure, the temperature of the gas, and consequently of the two spirals, falls sensibly. If this process is repeated with another current of gas, this current, having been cooled in the inner spiral, will be cooled still further, and the temperature of the two spirals will become still lower. If the pressures $p_1$ and $p_2$ remain constant the cooling will increase with the lowering of the temperature. In Linde’s apparatus this cycle is repeated over and over again, and after some time (about two or three hours) it becomes possible to draw off liquid air.

The cooling which is the consequence of such a decrease of pressure was experimentally determined in 1854 by Lord Kelvin (then Professor W. Thomson) and Joule, who represent the result of their experiments in the formula

$$T_1 - T_2 = \frac{p_1 - p_2}{T_2}.$$  

In their experiments $p_2$ was always 1 atmosphere, and the amount of $p_1$ was not large. It would, therefore, be certainly wrong, even though for a small difference in pressure the empiric formula might be approximately correct, without closer investigation to make use of it for the differences of pressure used in Linde’s apparatus, where $p_1 = 200$ and $p_2 = 18$ atmospheres. For the existence of a most favourable value of $p_1$ it is contradiction with the formula, since it would follow from it that $T_1 - T_2$ would always increase with the increase of $p_1$. Nor would it be right to regard as the cause for the existence of this most favourable value of $p_1$ the fact that the heat produced in the compression of the expanded gas, and therefore $p_1/p_2$, must be kept as small as possible, for the simple reason that the heat is produced in quite another part of the apparatus, and might be neutralized in different ways.

Closer examination of the process shows that if $p_2$ is given, a most favourable value of $p_1$ must exist for the cooling itself. If $p_1$ is taken still higher, the cooling decreases again; and we might take a value for $p_1$ for which the cooling would be zero, or even negative.

If we call the energy per unit of weight $c$ and the specific volume $v$, the following equation holds:

$$e_1 + p_1 v_1 - p_2 v_2 = c.$$  

or

$$e_1 + p_1 v_1 = e_2 + p_2 v_2.$$  

According to the symbols chosen by Gibbs, $c = c_T$.

As $c$ is determined by $p_1$ and $v_1$, and $v_1$ by $T_1$ and $p_1$, we obtain, if we take $T_1$ and $p_1$ as being constant:

$$\frac{\partial e_1}{\partial p_1} = \frac{\partial c_T}{\partial p_1} = \frac{(\partial p_1/\partial T_1)}{T_1}.$$  

If $T_1$ is to have a minimum value, we have

$$\frac{\partial p_1}{\partial T_1} = 0,$$  

from which

$$\frac{\partial p_1}{\partial T_1} = 0.$$  

As $\frac{\partial e_1}{\partial T_1}$ is positive, we shall have to take for the maximum cooling such a pressure that the product $p_1 v_1$ decreases with $v$, viz. a pressure larger than at which $p_1$ has the minimum value. By means of the equation of state, mentioned already, we find for the value of the specific volume that gives the greatest cooling the formula

$$\frac{RT_1}{c - \frac{\partial e_1}{\partial T_1}} = \frac{2}{\theta_1}.$$  

and for the value of the pressure

$$p_1 = 27 T_1 \left[1 - \sqrt{\frac{4 T_1}{27 \theta_1}}\right] - \frac{4 T_1}{27 T_1 - 1}.$$  

If we take the value of $T_1$ for $T_2$, as we may approximately for air when we begin to work with the apparatus, we find for $p_1$ about $8 p_2$, or more than 300 atmospheres. If we take $T_1 = T_2$ as we may at the end of the process, we find $p_1 = 2.5 p_2$, or 100 atmospheres. The constant pressure which has been found the most favourable in Linde’s apparatus is a mean of the two calculated pressures. In a theoretically perfect apparatus we ought, therefore, to be able to regulate $p_1$ according to the temperature in the inner spiral.

The critical temperatures and pressures of the permanent gases are given in the following table, the former being expressed on the absolute scale and the latter in atmospheres:

The values of $T_c$ and $p_c$ for hydrogen are those of Dewar. They are in approximate accordance with those given by K. Olszewski. Liquid hydrogen was first collected by J. Dewar in 1898. Apparatus for obtaining moderate and small quantities have been described by M. W. Travers and K. Olszewski. H. Kamlerling Onnes at Leiden has brought about a circulation yielding more than 3 litres per hour, and has made use of it to keep baths of 1½ litre capacity at all temperatures between 20-² and 13.7 absolute, the temperatures remaining constant within 0.01°. (See also LIQUID GASES.)

J. D. v. d. W.

**CONDENSER,** the name given to many forms of apparatus which have for their object the concentration of matter, or bringing it into a smaller volume, or the intensification of energy. In chemistry the word is applied to an apparatus which cools down, or condenses, a vapour to a liquid; reference should be made to the article DISTILLATION for the various types in use, and also to GAS (Gas Manufacturing) and COAL TAR; the device for the condensation of the exhaust steam of a steam-engine is termed the STEAM-ENGINE. In woolen manufactures, “condensation” of the wool is an important operation and is accomplished by means of a “condenser.” The term is also given—generally as a qualification, e.g. condensing-syringe, condensing-pump,—to apparatus by which air or a vapour may be compressed. In optics a “condenser” is a lens, or system of lenses, which serves to concentrate or bring the luminous rays to a focus; it is specially an adjunct to the optical lantern and microscope. In electrostatics a condenser is a device for concentrating an electrostatic charge (see ELECTROSTATICS; LEYDEN JAR; ELECTROPHORUS).

**CONDER, CHARLES** (1868–1909), English artist, son of a civil engineer, was born in London, and spent his early years in India. After an English education he went into the government service in Australia, but in 1890 determined to devote himself to art, and studied for several years in Paris, where in 1893 he became an associate of the Société Nationale des Beaux-Arts. About 1896 his reputation as an original painter, particularly of Watteau-like designs for fans, spread among a limited circle of artists in London, mainly connected first with the New English Art Club, and later the International Society; and his unique and charming decorative style, in dainty pastoral scenes, gradually gave him a peculiar vogue among connoisseurs. Examples of his work were bought for the Luxembourg and other art galleries. Conder suffered much in later years from ill-health, and died on the 9th of February 1909.

**CONDILLAC, ÉTIENNE BONNOT DE** (1715–1780), French philosopher, was born at Grenoble of a legal family on the 30th of September 1715, and, like his elder brother, the well-known political writer, abbé de Mably, took holy orders and became abbé de Mureau. In both cases the profession was hardly more than nominal, and Condillac's whole life, with the exception of an interval as tutor at the court of Parma, was devoted to speculation. His works are *Essai sur l'origine des connaissances humaines* (1746), *Traité des systèmes* (1749), *Traité des sensations* (1754), *Traité des animaux* (1755), a comprehensive *Cours d'études* (1767–1773) in 13 vols., written for the young Duke Ferdinand of Parma, a grandson of Louis XV., *Le Commerce et le gouvernement, considérés relativement l'un à l'autre* (1756), and two posthumous works, *Logique* (1781) and the unfinished *Langue des calculs* (1768). In his earlier days in Paris he came much into contact with the circle of Diderot. A friendship with Rousseau, which lasted in some measure to the end, may have been due in the first instance to the fact that Rousseau had been domestic tutor in the family of Condillac's uncle, M. de Mably. 1. *i.e. abbot in commendam* of the Premonstratensian abbey of Mureau in the Vosges. (Ed.)
at Lyons. Thanks to his natural caution and reserve, Condillac's relations with unorthodox philosophers did not injure his career; and he justified abundantly the choice of the French court in sending him to Parma to educate the orphan duke, then a child of seven years. In 1768, on his return from Italy, he was elected to the French Academy, but attended no meeting after his reception. He spent his later years in retirement at Plux, a small property which he had purchased near Beaugency, and died there on the 3rd of August 1780.

Though Condillac's genius was not of the highest order, he is important both as a psychologist and as having established systematically in France the principles of Locke, whom Voltaire had lately made fashionable. In setting forth his empirical sensationism, Condillac shows many of the best qualities of his age and nation, lucidity, brevity, moderation and an earnest striving after logical method. Unfortunately it must be said of him as of so many of his contemporaries, “er hat die Thele in seiner Hand, fehlt leider nur der gestigter Band”; in the analysis of the human mind on which his fame chiefly rests, he has missed out the active and spiritual side of human experience. His first book, the Essai sur l'origine des connaissances humaines, keeps close to his English master. He accepts with some indecision Locke's deduction of our knowledge from two sources, sensation and reflection, and he is most consistent in his belief that association of ideas is the basis of our knowledge of the external world. His next book, the Traité des systèmes, is a vigorous criticism of those modern systems which are based upon abstract principles or upon unsound hypotheses. His polemic, which is inspired throughout with the spirit of Locke, is directed against the innate ideas of the Cartesians, Malebranche's faculty—psychology. Leibnitz's monadism and pre-established harmony, and, above all, against the conception of substance set forth in the first part of the Ethics of Spinoza. By far the most important of his works is the Traité des sensations, in which he emancipates himself from the tutelage of Locke and treats psychology in his own characteristic way. He had been led, he tells us, partly by the criticism of a talented lady, Mademoiselle Ferrand, to question Locke's doctrine that the senses give us intuitive knowledge of objects, that the eye, for example, judges naturally of shapes, sizes, positions and distances. His discussions with the lady had convinced him that to clear up such questions it was necessary to study our senses separately, to distinguish precisely what ideas we owe to each sense, to observe how the senses are trained, and how one sense aids another. The result of his researches was to maintain that sensation and knowledge are transformed sensation only, to the exclusion of any other principle, such as reflection. The plan of the book is that the author imagines a statue organized inwardly like a man, animated by a soul which has never received an idea, into which no sense-impression has ever penetrated. He then unlocks its senses one by one, beginning with smell, as the sense that contributes least to human knowledge. At its first experience of smell, the consciousness of the statue is entirely occupied by it; and this occupancy of consciousness is attention. The statue's smell-experience will produce pleasure or pain; and pleasure and pain will thenceforward be the master-principle which, determining all the operations of its mind, will raise it by degrees to all the knowledge of which it is capable. The next stage is memory, which is the lingering impression of the smell-experience upon the attention: “memory is nothing more than a mode of feeling.” From memory springs comparison: the statue experiences the smell, say, of a rose, while remembering that of a carnation; and “comparison is nothing more than giving one's attention to two things simultaneously.” And “as soon as the statue has comparison it has all human reason.” Comparisons and judgments become habitual, are stored in the mind and formed into series, and thus arises the powerful principle of the association of ideas. From comparison of past and present experiences in respect of their pleasure-giving quality arises desire; it is desire that determines the operation of our faculties, stimulates the memory and imagination, and gives rise to the passions. The passions, also, are nothing but sensation transformed. These indications will suffice to show the general course of the argument in the first section of the Traité des sensations. To show the thoroughness of the treatment it will be enough to quote the headings of the chief remaining chapter: “Of the Ideas of a Man limited to the Sense of Smell,” “Of a Man limited to the Sense of Hearing,” “Of Smell and Hearing combined,” “Of Taste by itself, and of Taste combined with Smell and Hearing,” “Of a Man limited to the Sense of Sight.” In the second section of the treatise Condillac invests his statue with the sense of touch, which first informs it of the existence of external objects. In a very careful and elaborate analysis, he distinguishes the various elements in our tactile experiences—the touching of one's own body, the touching of objects other than one's own body, the experience of movement, the exploration of surfaces by the hands: he traces the growth of the statue's perceptions of extension, distance and shape. The third section deals with the combination of touch with the other senses. The fourth section deals with the desires, activities and ideas of an isolated man who enjoys possession of all the senses; and ends with observations on a “wild boy” who was found living among bears in the forests of Lithuania. The conclusion of the whole work is that in the natural order of things everything has its source in sensation, and yet that this source is not equally abundant in all men; men differ greatly in the degree of vividness with which he communicates from understanding the sensory character of thought; nor had he that interest in natural science and appreciation of inductive reasoning which form the chief merit of J. S. Mill. It is obvious enough that Condillac's anti-spiritual psychology, with its explanation of personality as an aggregate of sensations, leads straight to atheism and determinism. There is, however, no reason to question the sincerity with which he repudiates both these consequences. What he says upon religion is always in harmony with his profession; and he vindicated the freedom of the will in a dissertation that has very little in common with the Traité des sensations to which it is appended. The common reproach of materialism should certainly not be made against him. He always asserts the substantive reality of the soul; and in the opening words of his Essai, “Whether we rise to heaven, or descend to the abyss, we never get outside ourselves—it is always our own thoughts that we perceive,” we have the subjectivist principle that forms the starting-point of Berkeley.

As was fitting to a disciple of Locke, Condillac's ideas have had most importance in their effect upon English thought. In modern conceptions of the association of natural sensations and of pleasure and pain, and the general explanation of all mental contents as sensations or transformed sensations, his influence can be traced upon the Mills and upon Bain and Herbert Spencer. And, apart from any definite propositions, Condillac did a notable work in the direction of making psychology a science; it is a great step from the desultory, genial observation of Locke to the rigorous analysis of Condillac, short-sighted and defective as that analysis may seem to us in the light of fuller knowledge.
His method, however, of imaginative reconstruction was by no means suited to English ways of thinking. In spite of his protest against abstraction, hypothesis and synthesis, his allegory of the statue is in the highest degree abstract, hypothetical and synthetic. James Mill, who stood more by the study of concrete realities, put Condillac into the hands of his youthful son with the warning that there was an example of what to avoid in the method of psychology. In France Condillac’s doctrine, so congenial to the tone of 18th century philosophism, reigned in the schools for over fifty years, challenged only by a few who, like Maine de Biran, saw that it gave no sufficient account of volitional experience. Early in the 19th century, the romantic awakening of Germany had spread to France, and sensationalism was displaced by the eclectic spiritualism of Victor Cousin.

Condillac’s collected works were published in 1798 (23 vols.) and two or three times subsequently; the last edition (1822) has an introductory dissertation by A. F. Théry. The Encyclopédie méthodique has a very long article on Condillac (Naigeon). Biographical details and criticism of the Travail des systèmes in J. P. Damber’s Mémoires pour servir à l’histoire de la philosophie au dix-huitième siècle, tome iii.; a full criticism in V. Cousin’s Cours de l’histoire de la philosophie moderne, sér. i. tome iii. Consult also F. Rethoré, Condillac ou l’empirisme et le rationalisme (1864); L. Deuval, Condillac et la psychologie anglaise contemporaine (1869); histories of philosophy. (H. Srz.)

CONDITION—CONDOM

851

Thus all finite things exist in certain relations not only to all other things but also to thought; in other words, all finite existence is “conditioned.” Hence Sir Wm. Hamilton speaks of the “philosophy of the unconditioned,” i.e. of thought in distinction to things which are determined by thought in relation to other things. An analogous distinction is made (cf. H. W. B. Joseph, Introduction to Logic, pp. 350 foll.) between the so-called universal laws of nature and conditional principles, which, though they are regarded as having the force of law, are yet dependent or derivative, i.e. cannot be treated as universal truths. Such principles hold good under present conditions, but other conditions might be imagined under which they would be invalid; they hold good only as corollaries from the laws of nature under existing conditions.

(2) In Law, condition in its general sense is a restraint annexed to a thing, so that by the non-performance the party to it shall receive prejudice and loss, and by the performance commodity or advantage. Conditions may be either: (1) condition in a deed or express condition, i.e. the condition being expressed in actual words; or (2) condition in law or implied condition, i.e. where, although no condition is actually expressed, the law implies a condition. The word is also used indifferently to mean either the event upon the happening of which some estate or obligation is to begin or end, or the provision or stipulation that the estate or obligation will depend upon the happening of the event. A condition may be of several kinds: (1) a condition precedent, where, for example, an estate is granted to one for life upon condition that, if the grantee pay the grantor a certain sum on such a day, he shall have the fee simple; (2) a condition subsequent, where, for example, an estate is granted in fee upon condition that the grantee shall pay a certain sum on a certain day, or that his estate shall cease. Thus a condition precedent gets or gains, while a condition subsequent keeps and continues. A condition may also be affirmative, that is, the doing of an act; negative, the not doing of an act; restrictive, compulsory, &c.

The word is also used adjectivally in the sense set out above, as in the phrases “conditional legacy,” “conditional limitation,” “conditional promise,” &c.; that is, the legacy, the limitation, the promise is to take effect only upon the happening of a certain event.

CONDITIONAL FEE, at English common law, a fee or estate restrained in its form of donation to some particular heirs, as, to the heirs of a man’s body, or to the heirs male of his body. It was called a conditional fee by reason of the condition expressed or implied in the donation of it, that if the donee died without such particular heirs, the land should revert to the donor. In other words, it was a fee simple on condition that the donee had issue, and as soon as such issue was born, the estate was supposed to become absolute by the performance of the condition. A conditional fee was converted by the statute De Donis Conditionalibus into an estate tail (see REAL PROPERTY).

CONDITIONAL LIMITATION, in law, a phrase used in two senses. (1) The qualification annexed to the grant of an estate or interest in land, prohibiting the determination of that grant or interest upon a particular contingency happening. An estate with such a limitation can endure only until the particular contingency happens; it is a present interest, to be divested on a future contingency. The grant of an estate to a man so long as he is parson of Dale, or while he continues unmarried, are instances of conditional limitations of estates for life. (2) A future use or interest in land limited to take effect upon a given contingency. For instance, a grant to X. and his heirs to the use of A., provided that when C. returns from Rome the land shall go to the use of B. in fee simple. B. is said to take under a conditional limitation, operating by executory devise or springing or shifting use (see REMAINDER, REVERSION).

CONDOM, a town of south-western France, capital of an arrondissement in the department of Gers, on the right bank of the Baïse, at its junction with the Gêle, 27 m. by road N.N.W. of Auch. Pop. (1906) town, 4046; commune, 6435. Two stone bridges unite Condom with its suburb on the left bank of the river. The streets are small and narrow and several old
houses still remain, but to the east the town is bordered by pleasant promenades. The Gothic church of St Pierre, its chief building, was erected from 1506 to 1521, and was till 1790 a cathedral. The interior, which is without aisles or transept, is surrounded by lateral chapels. On the south is a beautifully sculptured portal. An adjoining cloister of the 16th century is occupied by the hôtel de ville. The former episcopal palace with its graceful Gothic chapel is used as a law-court. The sub-prefecture, a tribunal of first instance, and a communal college, are among the public institutions. Brandy-distilling, wood-sawing, iron-founding and the manufacture of stills are among the industries. The town is a centre for the sale of Armagnac brandy and has commerce in grain and flour, much of which is river-borne.

Condom (Condomus) was founded in the 8th century, but in 840 was sacked and burnt by the Normans. A monastery built here c. 900 by the wife of Sancho of Gascony was soon destroyed by fire, but in 1011 was rebuilt by Hugh, bishop of Agen. Round this abbey the town grew up, and in 1377 was made a free town by Pope John XXII. The line of bishops, which included Bossuet (1668-1717), came to an end in 1790 when the see was suppressed. Condum was, during the middle ages, a fortress of considerable strength. During the Hundred Years' War, after several unsuccessful attempts, it was finally captured and held by the English. In 1560 it was sacked by the Huguenots under Gabriel, count of Montgomery.

A list of monographs, &c., on the abbey, see and town of Conodom is given p. 2 in U. Chevalier, Répertoire des sources. Topobiblogr. (Montbéliard, 1894-1899).

CONDOR (Sarcorhampus gryphus), an American vulture, and almost the largest of existing birds of flight, although by no means attaining the dimensions attributed to it by early writers. It usually measures about 4 ft. from the point of the beak to the extremity of the tail, and 9 ft. between the tips of its wings, while it is probable that the expanse of wing never exceeds 12 ft. The head and neck are destitute of feathers, and the former, which is much flattened above, is in the main crowned with a caruncle or comb, while the skin of the latter in the same sex lies in folds, forming a wattle. The adult plumage is of a uniform black, with the exception of a frill of white feathers nearly surrounding the base of the neck, and certain wing feathers which, especially in the male, have large patches of white. The middle toe is greatly elongated, and the hinder one but slightly developed, while the talons of all the toes are comparatively straight and blunt, and are thus of little use as organs of prehension. The female, contrary to the usual rule among birds of prey, is smaller than the male.

The condor is a native of South America, where it is confined to the region of the Andes, from the Straits of Magellan to 4° north latitude,—the largest examples, it is said, being found about the volcano of Cayambí, situated on the equator. It is often seen on the shores of the Pacific, especially during the rainy season, but its favourite haunts are in mountainous and breeding areas at elevations of 10,000 to 16,000 ft. There, during the months of February and March, on inaccessible ledges of rock, it deposits two white eggs, from 3 to 4 in. in length, its nest consisting merely of a few sticks placed around the eggs. The period of incubation lasts for seven weeks, and the young are covered with a whitish down until almost as large as their parents. They are unable to fly till nearly two years old, and continue for a considerable time after taking wing to roost and hunt with their parents. The white ruff on the neck, and the similarly coloured feathers of the wings, do not appear until the completion of the first moulting. By preference the condor feeds on carrion, but it does not hesitate to attack sheep, goats and deer, and for this reason it is hunted down by the shepherds, who, it is said, train their dogs to look up and bark at the condors as they fly overhead. They are exceedingly voracious, a single condor of moderate size having been known, according to Ortis, to devour a calf, a sheep and a dog in a single week. When thus gorged with food, they are exceedingly stupid, and may then be readily caught. For this purpose a horse or mule

is killed, and the carcase surrounded with palissades to which the condors are soon attracted by the prospect of food, for the weight of evidence seems to favour the opinion that those vultures owe their knowledge of the presence of carrion more to sight than to scent. Having feasted themselves to excess, they are set upon by the hunters with sticks, and being unable, owing to the want of space within the pen, to take the run without which they are unable to rise on wing, they are readily killed or captured. They sleep during the greater part of the day, searching for food in the clearer light of morning and evening. They are remarkably heavy sleepers, and are readily captured by the inhabitants ascending the trees on which they roost, and noosing them before they awaken. Great numbers of condors are thus taken alive, and these, in certain districts, are employed in a variety of bull-fighting. They are exceedingly tenacious of life, and can exist, it is said, without food for over forty days. Although the favourite haunts of the condor are at the level of perpetual snow, yet it rises to a much greater height, Humboldt having observed it flying over Chimborazo at a height of over 23,000 ft. On wing the movements of the condor, as it wheels in majestic circles, are remarkably graceful.

The birds flap their wings on rising from the ground, but after attaining a moderate elevation they seem to sail on air, Charles Darwin having watched them for half an hour without once observing a flap of their wings.

CONDORCET, MARIE JEAN ANTOINE NICOLAS CARITAT, MARQUIS DE (1743-1794), French mathematician, philosopher and Revolutionist, was born at Ribemont, in Picardy, on the 17th of September 1743. He descended from the ancient family of Caritot, who took their title from Condorcet, near Nyon in Dauphiné, where they were long settled. His father dying while he was very young, his mother, a very devout woman, had him educated at the Jesuit College in Reims and at the College of Navarre in Paris, where he displayed the most varied mental activity. His first public distinctions were gained in mathematics. At the age of sixteen his performances in analysis gained the praise of D'Alembert and Abélard; and at the age of twenty-two he wrote a treatise on the integral calculus which obtained warm approbation from competent judges. With his many-sided intellect and richly-endowed emotional nature, however, it was impossible for him to be a specialist, and least of all a specialist in mathematics. Philosophy and literature attracted him, and social work was dearer to him than any form of intellectual exercise. In 1769 he became a member of the Academy of Sciences. His contributions to its memoirs are numerous, and many of them are on the most abstruse and difficult mathematical problems.

Being of a very genial, susceptible and enthusiastic disposition, he was the friend of almost all the distinguished men of his time, and a zealous propagator of the religious and political views then current among the literati of France. D'Alembert, Turgot and Voltaire, for whom he had great affection and veneration, and by whom he was highly respected and esteemed, contributed largely to the formation of his opinions. His Lettre d'un laboureur de Picardie à M. N. (Necker) was written under the inspiration of Turgot, in defence of free internal trade in corn. Condorcet also wrote on the same subject the Réflexions sur le commerce des blés (1776). His Lettre d'un théologien, &c., was attributed to Voltaire, being inspired throughout by the Voltairian ant clerical spirit. He was induced by D'Alembert to take an active part in the preparation of the Encyclopédie. His Élémens des Académiciens de l'Académie Royale des Sciences morts depuis 1666 jusqu'en 1699 (1773) gained him the reputation of being an eloquent and graceful writer. He was elected to the perpetual secretariate of the Academy of Sciences in 1777, and to the French Academy in 1782. He was also member of the academies of Turin, St Petersburg, Bologna and Philadelphia. In 1785 he published his Essai sur l'application de l'analyse aux probabilités des décisions prises à la pluralité des voix,—a remarkable work which has a distinguished place in the history of the doctrine of probability; a second edition, greatly enlarged and completely recast, appeared in 1804 under the title of Élémens du calcul
des probabilités et son application aux jeux de hasard, à la loterie, et aux jugements des hommes, &c. In 1786 he married Sophie de Grouchy, a sister of Marshal Grouchy, said to have been one of the most beautiful women of France. Her house, the Hôtel des Monnaies, where Condorcet lived in his capacity as inspector-general of the mint, was one of the most famous of the time. In 1786 Condorcet published his Vie de Turgot, and in 1789 his Vie de Voltaire. Both works were widely and eagerly read, and are perhaps, from a merely literary point of view, the best of Condorcet's writings.

The political tempest which had been long gathering over France now began to break and to carry everything before it. Condorcet was, of course, at once hurled along by it into the midst of the conflicts and confusion of the Revolution. He greeted with enthusiasm the advent of democracy, and laboured hard to secure and hasten its triumph. He was indefatigable in writing pamphlets, suggesting reforms, and planning constitutions. He was not a member of the States-General of 1789, but he had expressed his ideas in the electoral assembly of the noblesse of Mantes. The first political functions which he exercised were those of a member of the municipality of Paris (1790). He was next chosen by the Parisians to represent them in the Legislative Assembly, and then appointed by that body one of its secretaries. In this capacity he drew up most of its addresses, but seldom spoke, his pen being more effective than his tongue. He was the chief author of the appeal to the European powers when they threatened France with war. He was keenly interested in education, and, as a member of the committee of public instruction, presented to the Assembly (April 21 and 22, 1792) a bold and comprehensive scheme for the organization of a system of state education which, though more urgent questions compelled its postponement, became the basis of that adopted by the Convention, and thus laid the foundations on which the modern system of national education in France is built up. After the attempted flight of the king, in June 1791, Condorcet was one of the first to declare in favour of a republic, and it was he who drew up the memorandum which led the Assembly, on the 4th of September 1792, to decree the suspension of the king and the summoning of the National Convention. He had, meanwhile, resigned his office and left the Hôtel des Monnaies; his declaration in favour of republicanism had alienated him from his former friends of the constitutional party, and he did not join the Jacobin Club, which had not yet declared against the monarchy. Though attached to no powerful political group, however, his reputation gave him great influence. At the elections for the Convention he was chosen for five departments, and took his seat for Ille-et-Vilaine. As he became the most influential member of the committee on the convention and as "reporter" he drafted and presented to the Convention (February 15, 1793) a constitution, which was, however, after stormy debates, rejected in favour of that presented by Hérald de Séchelles. The work of constitution-making had been interrupted by the trial of Louis XVI. Condorcet objected to the assumption of judicial functions by the Convention, objected also on principle to the infliction of the death penalty; but he voted the king guilty of conspiring against liberty and worthy of any penalty short of death, and against the appeal to the people advocated by the Girondists. In the atmosphere of universal suspicion that inspired the Terror his independent attitude could not, however, be maintained with impunity. His severe and public criticism of the constitution adopted by the Convention, his denunciation of the arrest of the Girondists, and his opposition to the violent conduct of the Mountain, led to his being accused of conspiring against the Republic. He was condemned and declared to be hors la loi. Friends, sought for him an asylum in the house of Madame Vernet, widow of the sculptor and a near connexion of the painters of the same name. Without even asking his name, this heroic woman, as soon as she was assured that he was an honest man, said, "Let him come, and lose not a moment, for while we talk he may be seized." When the execution of the Girondists showed him that his presence exposed his protectress to a terrible danger, he resolved to seek a refuge elsewhere. "I am outlawed," he said, "and if I am discovered you will meet the same sad end as myself. I must not stay. Madame Vernet may secretly serve to be immortal, and this may be given, in her own words: "La Convention, Monsieur, a le droit de mettre hors la loi: elle n'a pas le pouvoir de mettre hors de l'humanité; vous resterez." From that time she had his movements strictly watched lest he should attempt to quit her house. It was partly to turn his mind from the idea of attempting this, by occupying it otherwise, that his wife and some of his friends, with the co-operation of Madame Vernet, prevailed on him to engage in the composition of the work by which he is best known—the Esquisse d'un tableau historique des progrès de l'esprit humain. In his retirement Condorcet wrote also his justification, and several small works, such as the Moyen d'apprendre à compter sûrement et avec facilité, which he intended for the schools of the republic. Several of these works were published at the time, thanks to his friends; the rest appeared after his death. Among the latter was the admirable Avis d'un prosécut à sa fille. While in hiding he also continued to take an active interest in public affairs. Thus, he wrote several important memoranda on the conduct of the war against the Coalition, which were laid before the Committee of Public Safety anonymously by a member of the Mountain named Marcoz, who lived in the same house as Condorcet without thinking it his duty to denounce him. In the same way, he forwarded to a Bapost, president of the committee for public instruction, the solutions of several problems in higher mathematics.

Certain circumstances having led him to believe that the house of Madame Vernet, 21 rue Servandoni, was suspected and watched by his enemies, Condorcet, by a fatally successful artifice, at last baffled the vigilance of his generous friend and escaped. Disappointed in finding even a night's shelter at the château of one whom he had befriended, he had to hide for three days and nights in the thickets and stone-warehouses of Clamart. On the evening of the 7th of April 1794—not, as Carlyle says, on a "bleared May morning"—with garments torn, with wounded leg, with famished looks, he entered a tavern in the village named, and called for an omelette. "How many eggs in your omelette?" "A dozen." "What is your trade?" "A carpenter." "Carpenters have not hands like these, and do not ask for a dozen eggs in an omelette." When his papers were demanded, he had none to show; when his person was searched a Horace was found on him. The villagers seized him, bound him, hailed him forthwith on bleeding feet towards Bourg-la-Reine; he faintly by the way, was set on a horse offered in pity by a passing peasant, and, at the journey's end, was cast into a cell at the inn. The next day he was found dead on the floor. Whether he had died from suffering and exhaustion, from apoplexy or from poison, is an undetermined question.

Condorcet was undoubtedly the most sincere, generous and noble-minded man. He was eager in the pursuit of truth, ardent in his love of human good, and ever ready to undertake labour or encounter danger on behalf of the philanthropic plans which his fertile mind contrived and his benevolent heart inspired. It was thus that he worked for the suppression of slavery, for the rehabilitation of the chevalier de La Barre, and in defence of Lally-Tollendal. He lived at a time when calumny was rife, and various slanderers were circulated regarding him, but fortunately the slightest examination proves them to have been inexplicable fabrications. That while openly opposing royalty he was secretly soliciting the office of tutor to the Dauphin; that he was accessory to the murder of the duc de la Rochefoucauld; or that he sanctioned the burning of the literary treasures of the learned congregations, are stories which can be shown to be utterly untrue.

His philosophical fame is chiefly associated with the Esquisse... des progrès mentioned above. With the vision of the guillotine before him, with confusion and violence around him, he comforted himself by trying to demonstrate that the evils of life had arisen from a conspiracy of priests and rulers against their fellows, and from the bad laws and institutions which they had succeeded in creating, but that the human race would finally conquer its
Madame de Condorcet (b. 1764), who was some twenty years younger than her husband, was rendered penniless by his procreation, and compelled to support not only herself and her four years old daughter but her younger sister, Charlotte de Grouchy. After the end of the Jacobin Terror she published an excellent translation of Adam Smith's Theory of Moral Sentiments; in 1798 a work of her own, Lettres sur la sympathie; and in 1799 her husband's Éloge des académiciens. Later she co-operated with Cabanis, who had married her sister, and with Garat in publishing the complete works of Condorcet (1801-1804). She adhered to the last to the political views of her husband, and under the Consulate and Empire her salon became a meeting-place of those opposed to the autocratic régime. She died at Paris on the 8th of September 1822. Her daughter was married, in 1807, to General O'Connor.

A Biographie de Condorcet, by M. F. Arago, is prefixed to A. Condorcet-O'Connor's edition of Condorcet's works, in 12 volumes (1847-1849). There is an able essay on Condorcet in Lord Morley of Huyton's Critical Miscellanies. On Condorcet as an historical philosopher see Comte's Cours de philosophie positive, iv. 252-253, and Système de politique positive, iv. Appendice Général, 109-111; F. Laurent, Études, xi. 121-126, 89-110; and R. Flint, Philosophy..., London, 1846, pp. 38-96. See also Cahen, De la Révolution française, extrait de sa correspondance et de cles de ses amis (2 vols., Paris, Ponthieu, 1824), which were in fact edited by F. G. de la Rochefoucauld-Liancourt, are spurious. Amongst the biographies of Condorcet, Comte, sa vie et ses œuvres, and more especially L. Cahen, Condorcet et la Révolution française (Paris, 1904), and Cahen, Système de la Révolution française (Paris, 1904). On Madame de Condorcet see Antoine Guillois, La Marguerise de Condorcet, sa famille, son salon et ses œuvres (Paris, 1897).

CONDOTTIERE (plural, condottieri), an Italian term, derived ultimately from Latin conditore, meaning either "to conduct" or "to hire," for the leader of the mercenary military companies, often several thousand strong, which used to be hired out to carry on the wars of the Italian states. The word is often extended so as to include the soldiers as well as the leader of a company. The condottieri played a very important part in Italian history from the middle of the 13th to the middle of the 15th century. The special political and military circumstances of medieval Italy, and in particular the wars of the Guelphs and Ghibelines, brought about that it the condottieri and their leaders played a more conspicuous and important part in history than the "Free Companies" elsewhere. Amongst these circumstances the absence of a numerous feudal cavalry, the relative luxury of city life, and the incapacity of city militia for wars of aggression were the most prominent. From this it resulted that the war was not merely the trade of the condottiere, but also his monopoly, so that he was thus able to obtain whatever terms he asked, whether monetary or personal, under expeditions. These companies were recruited from tendering military bands and individuals of all nations, and from the ranks of the many armies of middle Europe which from time to time overran Italy.

Montreal d'Albarno, a gentleman of Provence, was the first to give them a definite form. A severe discipline and an elaborate organization were introduced within the company itself, while in their relations to the people the most barbaric licence was permitted. Montreal himself was put to death at Rome by Rienzi, and Conrad Lando succeeded to the command. The Grand Company, as it was called, soon numbered about 7000 cavalry and 1500 select infantry, and was for some years the terror of Italy. They seem to have been Germans chiefly. On the conclusion (1350) of the peace of Bretigny between England and France, Sir John Hawkwood (q.v.) led an army of English mercenaries, called the White Company, into Italy, which took a prominent part in the confused wars of the next thirty years. Towards the end of the century the Italians began to organize armies of the same description. This ended the reign of the purely mercenary company, may be said to begin that of the semi-national mercenary army which ended in Europe till replaced by the national standing army system. The first company of importance raised on the new basis was that of St George, originated by Alberigo, count of Barbano, many of whose subordinates and pupils conquered principalities for themselves. Shortly after,
the organization of these mercenary armies was carried to the highest perfection by Sforza Attendolo, condottiere in the service of Naples, who had been a peasant of the Romagna, and by his rival Brancaccio di Montone in the service of Florence. The army and the renown of Sforza were inherited by his son Francesco Sforza, who eventually became duke of Milan (1450). Less fortunate was another great condottiere, Carmagnola, who first served one of the Visconti, and then conducted the wars of Venice against his former masters, but at last he woke the suspicion of the Venetian oligarchy, and was put to death before the palace of St Mark (1432). Towards the end of the 15th century, when the large cities had gradually swallowed up the small states, and Italy itself was drawn into the general current of European politics, and became the battlefield of powerful armies—French, Spanish and German—the condottieri, who in the end proved quite unequal to the gendarmerie of France and the improved troops of the Italian states, disappeared.

The soldiers of the condottieri were almost entirely heavy armoured cavalry (men-at-arms). They had, at any rate before 1450, nothing in common with the people among whom they fought, and a disorderly conduct and incapacity seem often to have exceeded that of other medieval armies. They were always ready to change sides at the prospect of higher pay. They were connected with each other by the interest of a common profession, and by the possibility that the enemy of to-day might be the friend and fellow-soldier of to-morrow. Further, a prisoner was always more valuable than a dead enemy. In consequence of all this their battles were often as bloodless as they were theatrical. Splendidly equipped armies were known to fight for hours with hardly the loss of a man (Zagonara, 1423; Molinella, 1467).

CONDUCTION, ELECTRIC. The electric conductivity of a substance is that property in virtue of which all its parts come spontaneously to the same electric potential if the substance is kept free from the operation of electric force. Accordingly, the reciprocal quality, electric resistivity, may be defined as a quality of a substance in virtue of which a difference of potential can exist between different portions of the body when these are in contact with some constant source of electromotive force, in such a manner as to form part of an electric circuit.

All material substances possess in some degree, large or small, electric conductivity, and may for the sake of convenience be broadly divided into five classes in this respect. Between these, however, there is no sharply-marked dividing line, and the classification must therefore be accepted as a more or less arbitrary one. These divisions are: (1) metallic conductors, (2) non-metallic conductors, (3) dielectric conductors, (4) electrolytic conductors, (5) gaseous conductors. The first class comprises all metallic substances, and those mixtures or combinations of metallic substances known as alloys. The second includes such non-metallic bodies as carbon, silicon, many of the oxides and peroxides of the metals, and probably also some oxides of the non-metals, sulphides and selenides. Many of these substances, for instance carbon and silicon, are well-known to have the property of existing in several different forms, and in some of these conditions, so far from being fairly good conductors, they may be almost perfect non-conductors. An example of this is seen in the case of carbon in its three allotropic conditions—charcoal, graphite and diamond. As charcoal it possesses a fairly well-marked but not very high conductivity in comparison with metals; as graphite, a conductivity about one-fourth of that of iron; but as diamond so little conductivity that the substance is included amongst insulators or non-conductors. The third class includes those substances which are generally called insulators or non-conductors, but which are better denominated dielectric conductors; it comprises such solid substances as mica, ebonite, shellac, india-rubber, gutta-percha, paraffin, and a large number of liquids, chiefly hydrocarbons. These substances differ greatly in insulating power, and according as the conductivity is more or less marked, they are spoken of as bad or good insulators. Amongst the latter many of the liquid gases hold a high position. Thus, liquid oxygen and liquid air have been shown by Sir James Dewar to be almost perfect non-conductors of electricity.

The behaviour of substances which fall into these three classes is discussed below in section I., dealing with metallic conductance.

The fourth class, namely the electrolytic conductors comprises all those substances which undergo chemical decomposition when they form part of an electric circuit traversed by an electric current. They are discussed in section II., dealing with electrolytic conductance.

The fifth and last class of conductors includes the gases. The conditions under which this class of substance becomes possessed of electric conductivity are considered in section III., on conduction in gases.

In connexion with metallic conductors, it is a fact of great interest and considerable practical importance, that, although the majority of metals when in a finely divided or powdered condition are practically non-conductors, a mass of metallic powder or filings may be made to pass suddenly into a conductive condition by being exposed to the influence of an electric wave. The same is true of the loose contact of two metallic conductors. Thus, if several plates of carbon be put against a metallic plate, say of aluminium, it is found that this metallic contact, if carefully adjusted, is non-conductive, but that if an electric wave is created anywhere in the neighbourhood, this non-conducting contact passes into a conductive state. This fact, investigated and discovered independently by D. E. Hughes, C. Onesti, E. Branly, O. J. Lodge and others, is applied in the construction of the "coherer," or sensitive tube employed as a detector or receiver in that form of "wireless telegraphy" chiefly developed by Marconi. Further references to it are made in the articles ELECTRIC WAVES and TELEGRAPHY: Wireless.

International Ohm.—The practical unit of electrical resistance was legally defined in Great Britain by the authority of the queen in council in 1834, as the "resistance offered to an invariable electric current by a column of mercury 10 cm. long, at the temperature of melting ice, 14.4°521 grammes in mass, of a constant cross-sectional area, and a length 100.3 centimetres." It is intended to represent as nearly as possible a resistance equal to 10° absolute C.G.S. units of electric resistance. Convenient multiples and sub-divisions of the ohm are the micromoh and the megohm, the former being one millionth part of an ohm, and the latter a million ohms. The resistivity of substances is then numerically expressed by stating the resistance of one cubic centimetre of the substance taken between opposed faces, and expressed in ohms, micromohs or megohms, as the case may be, the reciprocal of the ohm is called the mho, which is the unit of conductivity, and is defined as the conductivity of a substance whose resistance is one ohm. The absolute unit of conductivity is the conductivity of a substance whose resistivity is one absolute C.G.S. unit, or one hundred millionth part of an ohm. Resistivity is a quality in which material substances differ very widely. The metals and alloys, broadly speaking, are good conductors, and their resistivity is conveniently expressed in microhms per cubic centimetre, or in absolute C.G.S. units. Very small differences in density and in chemical purity make, however, immense differences in electric resistivity; hence the values given by different experimentalists for the resistivity of known metals differ to a considerable extent.

I. CONDUCTION IN SOLIDS

It is found convenient to express the resistivity of metals in two different ways: (1) We may state the resistivity of one cubic centimetre of the material in microhms or absolute units taken between opposed faces. This is called the volume-resistivity; (2) we may express the resistivity by stating the resistance in ohms offered by a wire of the material in question of uniform cross-section one metre in length, and one gramme in weight. This numerical measure of the resistivity is called the mass-resistivity. The mass-resistivity of a body is connected with its volume-resistivity and the density of the material in the following manner:—The mass-resistivity, expressed in microhms per metragramme, divided by 10 times the density is numerically equal to the volume-resistivity per centimetre-cube in absolute C.G.S. units. The mass-resistivity per metre-gramme can always be obtained by measuring the resistance and the mass of any wire of...
uniform cross-section of which the length is known, and if the
density of the substance is then measured, the volume-resistivity
of the substance can be immediately calculated.

If $R$ is the resistance in ohms of a wire of length $l$, uniform
cross-section $s$, and density $d$, then taking $\rho$ for the volume-resistivity
of the material we have $10^3 R = \rho l/d$; but $I = M$, where $M$ is the mass of the wire.
Hence $10^3 R = \rho M / d$. If $l = 100$ and $M = 1$, then $R = \rho$ is resistivity in ohms per
metre, or mass-resistivity, and $10^3 R = 10,000 \rho$, or $\rho = 10^3 R / d$, and
$\rho = 10^3 R / d$. The resistance $R$ is in ohms, and is the total
resistance in ohms, and then divide by the square of the length in
centimetres. Again, to obtain the volume-resistivity in C.G.S. units
per centimetre-cube, the rule is to multiply the mass-resistivity
in ohms per centimetre and divide by the density. These rules of course
apply only to wires of uniform cross-section. In the following
Tables I., II. and III. are given the mass and volume resistivity of
ordinary metals and certain alloys expressed in terms of the
international ohm or the absolute C.G.S. unit of resistance, the values
being calculated from the experiments of A. Matthiessen (1831-
1870) between 1860 and 1865, and from later results obtained by
J. A. Fleming and Sir James Dewar in 1893.

The data commonly used for calculating metallic resistivities
were obtained by A. Matthiessen, and his results are set out in the
Table II. which is taken from Cantor lectures given by Fleming
Jenkin in 1866 at or about the date when the researches were made.
The figures given by Jenkin have, however, been reduced to
international ohms and C.G.S. units by multiplying by $(\pi / 4) \times 9866 \times
10^3 = 77,455$.

Subsequently numerous determinations of the resistivity of various
pure solids have been made by Fleming and Dewar, whose results
are set out in Table III.

**Resistivity of Mercury.**—The volume-resistivity of pure mercury
is a very important electric constant, and since 1880 many of the
most celebrated experimenters have directed their attention to
the determination of its value. The experimental process has
usually been to fill a glass tube of known dimensions, having large
cup-like extensions at the ends, with pure mercury, and determine
the absolute resistivity of this column of metal. For the practical
details of this method a following reference may be consulted:
*The Specific Resistance of Mercury,* Lord Rayleigh and Mrs Side-
Glazebrook and T. C. Fitpatrick, *Phil. Trans.*, 1888, p. 179, or *Proc.
Determinations of the Absolute Resistance of Mercury,* R. T. Glazebrook,
Electrician, 1890, 25, pp. 543 and 568. Also see J. V. Jones,
*On the Determination of the Specific Resistance of Mercury in
Absolute Measure*, *Phil. Trans.*, 1891, A, p. 2. Table IV. gives
the values of the volume-resistivity of mercury as determined by

1 The values for nickel and bismuth given in the table are much
higher than previous values obtained with pure electrolytic nickel and
bismuth.

2 The value here given, namely 12,885, for the electric mass-
resistivity of liquid mercury as determined by Matthiessen is now
known to be too high by nearly 1%. The value at present accepted
is 12,789 ohms per metre-grammé at 0° C.

3 The values for silver and bismuth employed in the table are
higher than the values with pure electrolytic nickel and
bismuth.

4 The electrolytic silver used was prepared by Hartmann
and Braun, and the resistivity taken by J. A. Fleming. The value
is nearly 20% less than that given by Matthiessen.

Generally speaking, an alloy having high resistivity has poor mechanical qualities, its tensile strength and ductility are small. It is possible to form alloys having a resistivity as high as 100 microhms per cubic centimetre; but, on the other hand, the value of an alloy for electro-technical purposes is judged not merely by its resistivity, but also by the degree to which its resistivity varies with temperature, and by its capability of being easily drawn into fine wire of not very small tensile strength. Some pure metals when alloyed with a small proportion of another metal do not suffer much in their resistivity.

1 In 1899 a committee was formed of representatives from eight of the leading manufacturers of insulated copper cables with delegates from the Post Office and Institution of Electrical Engineers, to consider the presentation of the values to be assigned to the resistivity of hard-drawn and annealed copper. The sittings of the committee were held in London, the secretary being A. H. Howard. The values given in the above paragraphs are in accordance with the decision of this committee, and its recommendations have been accepted by the General Post Office and the leading manufacturers of insulated copper wire and cables.

2 Platinoid is an alloy introduced by Martino, said to be similar in composition to German silver, but with a little tungsten added. It varies a good deal in composition according to manufacture, and the resistivity of different specimens is not identical. Its electrical properties were first made known by J. T. Bottomley, in a paper read at the Royal Society, May 5, 1885.
CONDUCTION, Electric

change in resistivity, but in other cases the resultant alloy has a much higher resistivity. Thus an alloy of pure copper with 3% of aluminium has a resistivity about 53 times that of copper; but if pure aluminium is alloyed with 6% of copper, the resistivity of the product is not more than 20% greater than that of pure aluminium. The presence of a very small proportion of a non-metallic element in a metallic mass, such as oxygen, sulphur or phosphorus, has a very great effect in increasing the resistivity. Certain metallic elements also have the same power; thus platinoid has a resistivity 30% greater than German silver, though it differs from it merely in containing a trace of tungsten.

The resistivity of non-metallic conductors is in all cases higher than that of any pure metal. The resistivity of carbon, for instance, in the forms of charcoal or carbonized organic material and graphite, varies from 600 to 6000 megohms per cubic centimetre, as shown in Table VI. —

The resistivity of liquids is, generally speaking, much higher than that of any metals, metallic alloys or non-conductors. Thus fused lead chloride, one of the best conducting liquids, has a resistivity in its fused condition of 0.376 ohm per centimetre-cube, or 376,000 megohms per centimetre-cube, whereas that of metallic alloys only in few cases exceeds 100 megohms per centimetre-cube. The resistivity of solutions of metallic salts also varies very largely with the proportion of the diluent or solvent, and in some instances, as in the aqueous solutions of mineral acids, there is a maximum conductivity corresponding to a certain dilution. The resistivity of many liquids, such as alcohol, ether, benzene and pure water, is so high, in other words, their conductivity is so small, that they are practically insulators, and the resistivity can only be appropriately expressed in megs ohms per centimetre-cube.

In Table VII are given the names of a few of these badly-conducting liquids, with the values of their volume-resistivity in megs ohms per centimetre-cube:

The resistivity of all those substances which are generally called dielectrics or insulators is also so high that it can only be appropriately expressed in millions of megs ohms per centimetre-cube, or in megs ohms per quadrant-cube, the quadrant being a cubic side of which is 10 cm. (See Table VIII.)

**Effects of Heat.—** Temperature affects the resistivity of these different classes of conductors in different ways. In all cases, so far as is yet known, the resistivity of a pure metal is increased if its temperature is raised, and decreased if the temperature is lowered, so that if it could be brought to the absolute zero of temperature (−273° C.) its resistivity would be reduced to a very small fraction of its resistance at ordinary temperatures. With metallic alloys, however, rise of temperature does not always increase resistivity; it sometimes diminishes it, so that many alloys are known which have a maximum resistivity corresponding to a certain temperature, and at or near this point they vary very little in resistance with temperature. Such alloys have, therefore, a negative temperature-variation of resistance at and above fixed temperatures. Prominent amongst these metallic compounds are alloys of iron, manganese, nickel and copper, some of which were discovered by Edward Weston, in the United States. One well-known alloy of copper, manganese and nickel, now called manganin, which was brought to the notice of electricians by the careful investigations made at the Berlin Physikalisch-Technische Reichsanstalt, is characterized by having a zero temperature coefficient at or about a certain temperature in the neighbourhood of 15° C. Hence within a certain range of temperature on either side of this critical value the resistivity of manganin is hardly affected at all by temperature. Similar alloys can be produced from copper and ferro-

manganese. An alloy formed of 80% copper and 20% manganese in an annealed condition has a nearly zero temperature-variation of resistance between 20° C. and 100° C. In the case of non-metals the action of temperature is generally to diminish the resistivity as temperature rises, though this is not universally so. The interesting observation has been recorded by J. W. Howell, that "treated" carbon filaments and graphite are substances which have a minimum ratio corresponding to a rather severe temperature approaching red heat (Electricity, vol. xxviii. p. 835). At and beyond this temperature increased heating appears to increase their resistivity; this phenomenon may, however, be accompanied by a molecular change and not be a true temperature variation. In the case of dielectric conductors and of electrolytes the action of rising temperature is to reduce resistivity. Many of the so-called insulators, such as mica, ebonite, indiarubber, and the insulating oils, paraffin, &c., decrease in resistivity with great rapidity as the temperature rises. With gutta-percha a rise in temperature from 0° C. to 100° C. is sufficient to reduce the resistivity of one-twentieth part of its value at 0° C., and the resistivity of flint glass at 140° C. is only one-hundredth of what it is at 60° C.

A definition may here be given of the meaning of the term Temperature Coefficient. If, in the first place, we suppose that the resistivity (ρ) at any temperature (t) is a simple linear function of the resistivity (ρ0) at 0° C., then we can write ρ = ρ0(1 + αt), where α = (ρ0 − ρ)/ρ0.

The quantity α is called the temperature-coefficient, and its reciprocal is the temperature at which the resistivity would become
zero. By an extension of this notion we can call the quantity \( dp/dt \) the temperature coefficient corresponding to any temperature \( t \) at which the resistivity is \( \rho \). In all cases the relation between the resistivity of a substance and the temperature is best set out in the form of a curve, and such curves are drawn for various pure metals, temperature being taken as abscissa and resistivity as ordinate, and if the temperature range extends from the absolute zero of temperature upwards, then it is found that these isothermals are lines and that curves have having their convexity either upwards or downwards. In other words, the second differential coefficient of resistivity with respect to temperature is either a positive or negative quantity.

An extension of this method of expressing the form of the resistivity curve is that for various pure metals, temperature being taken as abscissa and resistivity as ordinate, and if the temperature range extends from the absolute zero of temperature upwards, then it is found that these isothermals are lines and that curves have having their convexity either upwards or downwards. In other words, the second differential coefficient of resistivity with respect to temperature is either a positive or negative quantity.

Thus the resistivities of the various metals were then calculated and set in out to show the manner in which they were to act. Figure 16 shows a portion of the curve with all of the resistivity values obtained by immersing the coils in boiling liquid oxygen, the resistivity being calculated to the magnitude of the magnetic field, and the resistivity of the liquid oxygen being obtained by immersing the coils into a liquid of the same density as that of the liquid oxygen.

CONDUCTION, ELECTRIC

[LIQUIDS]

Reichsanstalt is given in the Report of the British Association Committee on Electrical Standards, presented at the Edinburgh Meeting in 1892. For the design and construction of standards of electric resistances adapted for employment in the comparison and measurement of very low or very high resistances, the reader may be referred to standard treatises on electric measurement.

II. CONDUCTION IN LIQUIDS

Through liquid metals, such as mercury at ordinary temperatures and other metals at temperatures above their melting points, the electric current flows as in solid metals without changing the state of the conductor, except in so far as heat is developed by the electric resistance. But another class of liquid conductors to which we are referring are those which consist of solutions of metals, and in them the phenomena are quite different. The conductivity of fused salts, and of solutions of salts and acids, although less than that of metals, is very great compared with the traces of conductivity found in so-called non-conductors. In fused salts and conducting solutions the passage of the current is always accompanied by definite chemical changes; the substance of the conductor or electrolyte is decomposed, and the products of the decomposition appear at the electrodes, i.e., the metallic plates by means of which the current is led into and out of the solution. The chemical phenomena are considered in the article ELECTROLYSIS; we are here concerned solely with the mechanism of this electrolytic conduction of the current.

To explain the appearance of the products of decomposition at the electrodes only, while the intervening solution is unaltered, we suppose that, under the action of the electric forces, the opposite parts of the electrolyte move in opposite directions through the liquid. These opposite parts, named ions by Faraday, must therefore be associated with electric charges, and it is the convective movement of the opposite streams of ions carrying their charges with them, that, on view, constitutes the current.

In metallic conduction it is found that the current is proportional to the applied electromotive force—a relation known by the name of Ohm's law. If we place in a circuit with a small electromotive force an electrolytic cell consisting of two platinum electrodes and a solution, the initial current soon dies away, and we shall find that a certain minimum electromotive force must be applied to the circuit before any considerable permanent current passes. The chemical changes which are initiated on the surfaces of the electrodes set up a reverse electromotive force of polarization, and, until this is overcome, only a minute current, probably due to the slow but steady removal of the products of decomposition from the electrodes by a process of diffusion, will pass through the cell. Thus it is evident, that, considering the electrolytic cell as a whole, the passage of the current through it cannot conform to Ohm's law. But the polarization is due to chemical changes, which are confined to the surfaces of the electrodes; and it is necessary to inquire whether, if the polarization at the electrodes be eliminated, the passage of the current through the bulk of the solution itself is proportional to the electromotive force of the applied current? The experiments of Matthiessen and others have shown that the current is proportional to the excess of the electromotive force over a constant value, and thus verifies the law approximately, the constant electromotive force to be overcome being a measure of the polarization. A more satisfactory examination of the question was made by F. Kohlrausch in the years 1873 to 1876. Ohm's law states that the current C is proportional to the electromotive force E, or C = kE, where k is a constant called the conductivity of the circuit. The equation may also be written as C = E/R, where R is a constant, the reciprocal of k, known as the resistance of the circuit. The essence of the law is the proportionality between C and E, which means that the ratio E/C is a constant. But E/C = R, and thus the law may be tested by examining the constancy of the measured resistance of a conductor when different currents are passing through it. In this way Ohm's law has been confirmed in the case of metallic conduction to a very high degree of accuracy. A similar principle was applied by Kohlrausch to the case of electrolytes, and he was the first to show that an electrolyte possesses a definite resistance which has a constant value when measured with different currents and by different experimental methods.

Measurement of the Resistance of Electrolytes.—There are two effects of the passage of an electric current which prevent the possibility of measuring electrolytic resistance by the ordinary methods with the direct currents which are used in the case of metals. The products of the chemical decomposition of the electrolyte appear at the electrodes and set up the opposing electromotive force of polarization, and unequal dilution of the solution may occur in the neighbourhood of the two electrodes. The chemical and electrolytic aspects of these phenomena are treated in the article ELECTROLYSIS, but from our present point of view it is evident that they are again of fundamental importance. The polarization at the surface of the electrodes will set up an opposing electromotive force, and the unequal dilution of the solution will turn the electrolyte into a concentration cell and produce a subsidiary electromotive force either in the same direction as that applied or in the reverse according as the anode or the cathode solution becomes the more dilute. Both effects thus involve internal electromotive forces, and prevent the application of Ohm's law to the electrolytic cell as a whole. But the existence of a definite measurable resistance as a characteristic property of the system depends on the conformity of the system to Ohm's law, and it is therefore necessary to eliminate both these effects before attempting to measure the resistance.

The usual and most satisfactory method of measuring the resistance of electrolytes consists in eliminating the effects of polarization by the use of alternating currents, that is, currents that are reversed in direction many times a second. The chemical action produced by the first current is thus reversed by the second current in the opposite direction, and the polarization effects are diminished. The objection to this method is that the electrodes are destroyed before it rises to an appreciable value. The polarization is also diminished in another way. The electromotive force of polarization is due to the deposition of films of the products of chemical decomposition on the surface of the electrodes, and only reaches its full value when a continuous film is formed. If the current be stopped before such a film is completed, the reverse electromotive force is less than its full value. A given current flowing for a given time deposits a definite amount of substance on the electrodes, and therefore the amount per unit area is inversely proportional to the area of the electrodes—to the area of contact, that is, between the electrode and the liquid. Thus, by increasing the area of the electrodes, the polarization due to a given current is decreased. Now the area of free surface of a platinum plate can be increased enormously by coating the plate with platinum black, which is metallic platinum in a spongy state, and with such a plate as electrode the effects of polarization are diminished to a very marked extent. The coating is effected by passing an electric current first one way and then the other between two platinum plates immersed in a 3% solution of platinum chloride to which a trace of lead acetate is sometimes added. The platinized plates thus obtained are quite satisfactory for the investigation of strong solutions. They have the power, however, of absorbing a certain amount of salt from the solutions and of giving it up again when water or more dilute solution is placed in contact with them. The measurement of very dilute solutions is thus made difficult, but, if the plates are heated to
redness after being platinized, a grey surface is obtained which possesses sufficient area for use with dilute solutions and yet does not absorb an appreciable quantity of salt.

Any convenient source of alternating current may be used. The currents from the secondary circuit of a small induction coil are satisfactory, or the currents of an alternating electric light supply may be transformed down to an electromotive force of one or two volts. With such currents it is necessary to consider the effects of self-induction in the circuit and of electrostatic capacity. In balancing the resistance of the electrolyte, resistance coils may be used in which self-induction and the capacity are reduced to a minimum by winding the wire of the coil backwards and forwards in alternate layers.

With these arrangements the usual method of measuring resistance by means of Wheatstone's bridge may be adapted to the case of electrolytes. With alternating currents, however, it is impossible to use a galvanometer in the usual way. The galvanometer was therefore replaced by Kohlraush by a telephone, which gives a sound when an alternating current passes through it. The most common plan of the apparatus is shown diagrammatically in fig. 1. The electrolytic cell and a resistance box form two arms of the bridge, and the sliding contact is moved along the metre wire which forms the other two arms till no sound is heard in the telephone.

The resistance of the electrolyte is to that of the box as that of the right-hand end of the wire is to that of the left-hand end. A more accurate method of using alternating currents, and one more pleasant to use, gets rid of the telephone (Phil. Trans., 1900, 104, p. 321). The current from one or two voltaic cells is led to an ebonite drum turned by a motor or a hand-wheel and cord. On the drum are fixed brass strips with wire brushes touching them in such a manner that the current from the brushes is reversed several times in each revolution of the drum. The wires from the brushes are con- nected with the Wheatstone's bridge. A moving coil galvanometer is used as indicator, its connexion being reversed in time with those of the battery by a slightly narrower set of brass strips fixed on the other end of the ebonite commutator. Thus any residual current through the galvanometer is direct and not alternating. The high moment of inertia of the coil makes the period of swing slow compared with the period of alternation of the current, and the slight periodic disturbances are thus prevented from affecting the galvanometer. When the measured resistance is not altered by increasing the speed of the commutator or changing the ratio of the arms of the bridge, the disturbing effects may be considered to be eliminated.

The form of vessel chosen to contain the electrolyte depends on the order of resistance to be measured. For dilute solutions the shape of cell shown in fig. 2 will be found convenient, while for more concentrated solutions, that indicated in fig. 3 is suitable. The absolute resistances of certain solutions have been determined by Kohlraush by comparison with mercury, and, by using one of these solutions in any cell, the constant of that cell may be found once for all. From the observed resistance of any given solution in the cell the resistance of a centimetre cube—the so-called specific resistance—may be calculated. The reciprocal of this, or the conductivity, is a more generally useful constant; it is conveniently expressed in terms of a unit equal to the reciprocal of an ohm. Thus Kohlraush found that a solution of potassium chloride, containing one-tenth of a gram equivalent (7.40 grams) per litre, has at 18° C. a specific resistance of 80.37 ohms per centimetre cube, or a conductivity of 1.119 X 10⁻⁴ mhos or 1.119 X 10⁻³ C.G.S. units. As the temperature variation of conductivity is large, usually about 3% per degree, it is necessary to place the resistance cell in a paraffin or water bath, and to observe its temperature with some accuracy.

Another way of eliminating the effects of polarization and of dilution has been used by W. Stroud and J. B. Henderson (Phil. Mag., 1807 [5], 43, p. 19). Two of the arms of a Wheatstone's bridge are composed of narrow tubes filled with the solution, the tubes being of equal diameter but of different length. The other two arms are made of coils of wire of equal resistance, and metallic resistance is added to the shorter tube till the bridge is balanced. Direct currents of somewhat high electromotive force are used to work the bridge. Equal currents then flow through the two tubes; the effects of polarization and dilution must be the same in each, and the resistance added to the shorter tube must be equal to the resistance of a column of liquid the length of which is equal to the difference in length of the two tubes.

A somewhat different principle was adopted by E. Boute in 1884. If a current be passed through two resistances in series by means of an applied electromotive force, the electric potential falls from place to place like the resistances to the other, and, if we apply Ohm's law to each resistance, we can successfully, since for each of them E = CR, and C the current is the same through both, E the electromotive force or fall of potential between the ends of each resistance must be proportional to the resistance between them. Thus by measuring the potential difference between the ends of the two resistances successively, we may compare their resistances. If, on the other hand, we can measure the potential difference in some known units, and similarly measure the current flowing, we can determine the resistance of a single electrolyte. The details of the apparatus may vary, but its principle is illustrated in the following description. A narrow glass tube is fixed horizontally into side openings in two glass vessels, and an electric current passed through it by means of platinum electrodes and a battery of considerable electromotive force. In this way a steady fall of electric potential is set up along the length of the tube. To measure the potential difference between the ends of tapping electrodes are constructed, e.g., by placing zinc rods in vessels with zinc sulphate solution and connecting these vessels (by means of thin siphon tubes also filled with solution) with the vessels at the ends of the long tube which contains the electrolyte to be examined. Whatever be the contact potential difference between zinc and its solution, it is the same at both ends, and thus the potential difference between the zinc rods is equal to that between the liquid at the two ends of the tube. This potential difference may be measured without passing any appreciable current through the tapping electrodes, and thus the resistance of the liquid deduced.

Equivalent Conductivity of Solutions.—As is the case in the other properties of solutions, the phenomena are much more simple when the concentration is small than when it is great, and a study of dilute solutions is therefore the best way of getting an insight into the essential principles of the subject. The foundation of our knowledge was laid by Kohlraush when he had developed the method of measuring electrolyte resistance described above. He obtained in this results in terms of "equivalent conductivity," which is, the conductivity (g) of the solution divided by the number (m) of gram-equivalents of electrolyte per litre. He finds that, as the concentration diminishes, the value of k/m approaches a limit, and eventually becomes constant, that is to say, at great dilution the conductivity is proportional to the concentration. Kohlraush first prepared very pure water by repeated distillation and found that its resistance continually increased as the process of purification proceeded. The conductivity of the water, and of the slight impurities which must always remain, was subtracted from that of the solution made with it, and the result, divided by m, gave the equivalent conductivity of the substance dissolved. This procedure appears justifiable, for as long as conductivity is proportional to concentration it is evident that each part of the dissolved matter produces its own independent effect, so that the total conductivity is the sum of the conductivities of the parts;
when this ceases to hold, the concentration of the solution has in general become so great that the conductivity of the solvent may be neglected. The general result of these experiments can be represented graphically by plotting $k/m$ as ordinates and $\frac{1}{m}$ as abscissae, $\frac{1}{m}$ being a number proportional to the reciprocal of the average distance between the molecules, to which it seems likely that the molecular conductivity may be related. Two general types of curve for a simple neutral salt like potassium or sodium chloride and for a caustic alkali or acid are shown in fig. 4. The curve for the neutral salt comes to a limiting value; that for the acid attains a maximum at a certain very small concentration, and falls again when the dilution is carried farther. It has usually been considered that this destruction of conductivity is due to chemical action between the acid and the residual impurities in the water. At such great dilution these impurities are present in quantities comparable with the amount of acid which they convert into a less highly conducting neutral salt. In the case of acids, then, the maximum must be taken as the limiting value. The decrease in equivalent conductivity at great dilution is, however, so constant that this explanation seems insufficient. The true cause of the fall in conductivity may be related. Thus with the fact that the bodies in which it occurs, acids and alkalis, contain the ions, hydrogen in the one case, hydroxyl in the other, which are present in the solvent, water, and have, perhaps because of this relation, velocities higher than those of any other ions. The values of the molecular conductivities of all neutral salts are, at great dilution, of the same order of magnitude, while those of acids at their maxima are about three times as large. The increase in decreasing concentration is greater in the case of salts containing divalent ions, and greatest of all in such cases as solutions of ammonia and acetic acid, which are substances of very low conductivity.

**Theory of Moving Ions.**—Kohlrausch found that, when the polarization at the electrodes was eliminated, the resistance of a solution was constant however determined, and thus established Ohm's Law for electrolytes. The law was confirmed in the case of strong currents by G. F. Fitzgerald and F. T. Trouton (B.A. Report, 1886, p. 312). Now, Ohm's Law implies that no work is done by the current in overcoming reversible electromotive force, whereas those of polarization. Thus the molecular interchange of ions must occur in order that such a work be able to work their way through the liquid and appear at the electrodes, continues throughout the solution whether a current is flowing or not. The influence of the current on the ions is merely directive, and, when it flows, streams of electrified ions travel in opposite directions, and, if the applied electromotive force is enough to overcome the local polarization, give up their charges to the electrodes. We may therefore represent the facts by considering the process of electrolysis to be a kind of convection. Faraday's classical experiments proved that when a current flows through an electrolyte the quantity of substance liberated at each electrode is proportional to its chemical equivalent weight, and to the total amount of electricity passed. Accurate determinations have since shown that the mass of an ion deposited by one electromagnetic unit of electricity, i.e., its electrochemical equivalent, is $1.036 \times 10^{-5}$, its chemical equivalent weight. Thus the amount of electricity associated with one gram-equivalent of any ion is $10/1.036 = 9653$ units. Each monovalent ion must therefore be associated with a certain definite charge, which we may take to be a natural unit of electricity; a divalent ion carries two such units, and so on. A cation, i.e., an ion giving up its charge at the cathode, as the electrode at which the current leaves the solution, carries a positive charge of electricity; an anion, travelling in the opposite direction, carries a negative charge. It will now be seen that the quantity of electricity flowing per second, i.e., the current through the solution, depends on (1) the number of the ions concerned, (2) the charge on each ion, and (3) the velocity with which the ions travel past each other. Now, the number of ions is given by the concentration of the solution, for even if all the ions are not actively engaged in carrying the current at the same instant, they must, on any dynamical idea of chemical equilibrium, be all active in turn. The charge on each, as we have seen, can be expressed in absolute units, and therefore the velocity with which they move past each other can be calculated. This was first done by Kohlrausch (Göttingen Nachrichten, 1876, p. 213, and Das Leitvermögen der Elektrolyte, Leipzig, 1889) about 1879.

In order to develop Kohlrausch's theory, let us take, as an example, the case of an aqueous solution of potassium chloride, of concentration $n$ gram-equivalents per cubic centimetre. There will then be $n$ gram-equivalents of potassium ions and the same number of chloride ions in this volume. Let us suppose that on each gram-equivalent of potassium there reside $+e$ units of electricity, and on each gram-equivalent of chloride ions $-e$ units. If $u$ denotes the average velocity of the potassium ions, the positive charge carried per second unit area normal to the flow is $n e u$. Similarly, if $v$ be the average velocity of the chloride ions, the negative charge carried in the opposite direction is $n e v$. But positive electricity moving in one direction is equivalent to negative electricity moving in the other, so that, before charges begin to sensibly supervene, the total current, $C$, is $n(u+v)$. Now, let us consider the amounts of potassium and chloride liberated at the electrodes by this current. At the cathode, if the chloride ions were at rest, the excess of potassium ions would be simply those arriving in one second, namely, $n e u$. But since the chloride ions are also, a further separation occurs, and potassium ions are left without partners. The total number of gram-equivalents liberated is therefore $n(u+v)$. By Faraday's law, the number of grams liberated is equal to the product of the current and the electro-chemical equivalent of the ion; the number of gram-equivalents therefore must be equal to $n C$, where $C$ denotes the electro-chemical equivalent of hydrogen in C.G.S. units. Thus we get

$$n(u+v) = nC = n(C-iv),$$

and it follows that the charge, $e$, on 1 gram-equivalent of each kind of ion is equal to $1/n$. We know that Ohm's Law holds good for electrolytes, so that the current, $i$, is also given by the equation:

$$i = C-iv = n(u+v).$$

When the potential gradient is one volt (10$^8$ C.G.S. units) per centimetre this becomes

$$u+v = 1.036 \times 10^{-5} e k/m.$$  

Thus by measuring the value of $k/m$, which is the equivalent conductivity of the solution, we can find $u+v$, the velocity of the ions in the solution. In this instance, the equivalent conductivity of a solution of potassium chloride containing one-tenth of a gram-equivalent per litre is $1119 \times 10^{-4}$ C.G.S. units at 18°C. Therefore

$$u+v = 1.036 \times 10^{-5} \frac{e}{m} = 1.159 \times 10^{-4} \text{ cm per sec.}$$

In order to obtain the absolute velocities $u$ and $v$, we must find some relation between them. Let us resolve $u$ into $(u+v)$ in one direction, say to the right, and $(u-v)$ to the left. Similarly $v$ can be resolved into $(u+v)$ at the left and $(u-v)$ to the right. On plotting these velocities we have a compound movement of the ions to the right, with a speed of $(u-v)$ and a drift right and left, past each other, each ion travelling with a speed of $(u+v)$, constituting the electrolytic separation. If $u$ is greater than $v$, the combined movement involves a concentration of salt at the cathode, and a corresponding dilution at the anode, and vice versa. The rate at which salt is electrolysed, and thus removed from the solution at each electrode, is $(u+v)$. Thus the total loss of salt at the cathode is $(u+v) = (u+v) + (u+v)$ or, and at the anode, $((u-v) - (u-v))$. Therefore, as is explained in the article ELECTROLYSIS, by measuring the dilution of the liquid round the electrodes when a current passed, W. Hittorf (Pogg. Ann., 1853-1859, 89, p. 177; 98, p. 103; 101, p. 116, pp. 337 and 513) was able to deduce the ratio of the two velocities. If some salt when no complex ions are present, and many further
experiments have been made on the subject (see *Das Leitvermögen der Elektrolyte*).

By combining the results thus obtained with the sum of the velocities, as determined from the conductivities, Kohlrausch calculated the absolute velocities of different ions under stated conditions. Thus, in the case of the solution of potassium chloride considered above, Hittorf's experiments show us that the ratio of the velocity of the anion to that of the cation in this solution is \( \frac{\text{Cl}^-}{\text{K}^+} = 0.49 \). The absolute velocity of the potassium ion under unit potential gradient is therefore \( 0.00567 \) cm. per sec., and that of the chlorine ion 0-000392 cm. per sec. Similar calculations can be made for solutions of other concentrations, and of different substances.

Table IX. shows Kohlrausch's values for the ionic velocities of three chlorides of alkali metals at 18°C., calculated for a potential gradient of 1 volt per cm.; the numbers are in terms of a unit equal to \( 10^{-4} \) cm. per sec.---

These numbers show clearly that there is an increase in ionic velocity as the dilution proceeds. Moreover, if we compare the values for the chlorine ion obtained from observations on these three different salts, we see that as the concentrations diminish the velocity of the chloride ion becomes the same in all of them. A similar relation appears in other cases, and, in general, we may say that at great dilution the velocity of an ion is independent of the nature of the other ion present. This introduces the conception of specific ionic velocities, for which some values at 18°C. are given by Kohlrausch in Table X.---

Having obtained these numbers we can deduce the conductivity of the dilute solution of any salt, and the comparison of the calculated with the observed values further the confirmation of Kohlrausch's theory. Some exceptions, however, are known. Thus acetic acid and ammonia give solutions of much lower conductivity than is indicated by the sum of the specific ionic velocities of their ions as determined from other compounds. An attempt to find in Kohlrausch's theory some explanation of this discrepancy shows that it could be due to one of two causes. Either the velocities of the ions must be much less in these solutions than in others, or else only a fractional part of the number of molecules present can be actually concerned in conveying the current, and we shall return to this point later.

**Friction on the Ions.**—It is interesting to calculate the magnitude of the forces required to drive the ions with a certain velocity. If we have a potential gradient of 1 volt per centimetre the electric force is \( 10^6 \) in C.G.S. units. The charge of electricity on 1 gram-equivalent of any ion is \( \text{charge} = \frac{1}{100010.6} \times 9655 \) units, hence the mechanical force acting on this mass is \( 9655 \times 10^6 \) dynes. This, let us say, produces a velocity \( u \); then the force required to produce unit velocity is \( F = \frac{9655 \times 10^6}{u} \) dynes = \( \frac{84 \times 10^6}{u} \) kilograms-weight.

If the ion has an equivalent weight \( A \), the force producing unit velocity, when acting on 1 gram is \( P = \frac{84 \times 10^6}{A} \) kilograms-weight.

Thus the aggregate force required to drive 1 gram of potassium ions with a velocity of 1 centimetre per second through a very dilute solution must be equal to the weight of 38 million kilograms.

Since the ions move with uniform velocity, the frictional resistances brought into play must be equal and opposite to the driving forces, and therefore these numbers also represent the ionic friction coefficients in very dilute solutions at 18°C.

**Direct Measurement of Ionic Velocities.**—Sir Oliver Lodge was the first to directly measure the velocity of an ion (B.A. Report, 1886, p. 389). In a horizontal glass tube connecting two vessels filled with dilute sulphuric acid he placed a solution of sodium chloride in solid agar-agar jelly. This solid solution was made alkaline with a trace of caustic soda in order to bring out the red colour of the little phosphorescent steel added as indicator. An electric current was then passed from one vessel to the other. The hydrogen ions from the anode vessel of acid were thus carried along the tube, and, as they travelled, decolorized the phenolphthalein. By this method the velocity of the hydrogen ion through a jelly solution under a known potential gradient was observed to about 0.0026 cm. per sec., a number of the same order as that required by Kohlrausch's theory. Direct determinations of the velocities of a few other ions have been made by W. C. D. Whetham (*Phil. Trans.*, vol. 184, A, p. 337; vol. 186, A, p. 507; *Phil. Mag.,* October 1894). Two solutions having one ion in common, of equivalent concentrations, different densities, different colours, and nearly equal specific resistances, were placed one over the other in a vertical glass tube. In one case, for example, decinormal solutions of potassium carbonate and potassium bichromate were used. The colour of the latter is due to the presence of the bichromate group, \( \text{Cr}_2\text{O}_7^{2-} \). When a current was passed across the junction, the anions \( \text{CO}_3^{2-} \) and \( \text{Cr}_2\text{O}_7^{2-} \) travelled in the direction opposite to that of the current, and their velocity could be determined by measuring the rate at which the colour boundary moved. Similar experiments were made with alcoholic solutions of cobalt salts, in which the velocities of the ions were found to be much less than in water. The behaviour of agar jelly was then investigated, and the velocity of an ion through a solid jelly was shown to be very little less than in an ordinary liquid solution. The velocities could therefore be measured by tracing the change in colour of an indicator or the formation of a precipitate. Thus decinormal jelly solutions of barium chloride and sodium chloride, the latter containing a trace of sodium sulphate, were placed in contact. Under the influence of an electromotive force the barium ions moved up the tube, disclosing their presence by the trace of insoluble barium sulphate formed. Again, a measurement of the velocity of the hydrogen ion, when travelling through the solution of an acetate, showed that its velocity was then only about the one-fourth part of that found during its passage through chlorides. From this, as from the measurements on alcohol solutions, it is clear that where the equivalent conductivities are very low the effective velocities of the ions are reduced in the same proportion.

Another series of direct measurements has been made by Orme Maclennan (*Phil. Trans.* vol. 194, A, p. 531). He placed the gelatin solutions of a salt, potassium chloride, for example, in a horizontal glass tube, and found the rate of migration of the potassium and chlorine ions by observing the speed at which they were replaced when a coloured anion, say, \( \text{Cr}_2\text{O}_7^{2-} \) from a solution of potassium bichromate, entered the tube at one end, and a coloured cation, say, the \( \text{Cu}^2+ \) from copper sulphate, at the other. The coloured ions are specifically slower than the colourless ions which follow, and in this case it follows that the coloured solution has a
higher resistance than the colourless. For the same current, therefore, the potential gradient is higher in the coloured solution and lower in the colourless one. Thus a coloured ion which goes in front of the advancing boundary finds itself acted on by a small force and falls back into line, while a straggling colourless ion is pushed forward again. Hence a sharp boundary is preserved. B. D. Steele has shown that with these sharp boundaries the use of coloured ions is unnecessary, the junction line being visible owing to the difference in the optical refractive indices of two colourless solutions. Once the boundary is formed, too, no gelatine is necessary, and the motion can be watched through liquid aqueous solutions (see R. B. Denison and B. D. Steele, Phil. Trans., 1906).

All the direct measurements which have been made on simple binary electrolytes agree with Kohlrausch’s results within the limits of experimental error. His theory, therefore, probably holds good in such cases, whatever be the solvent, if the proper values are given to the ionic velocities, i.e. the values expressing the velocities with which the ions actually move in the solution of the strength taken, and under the conditions of the experiment. If we know the specific velocity of any one ion, we can, from the conductivity of very dilute solutions, the velocity of any other ion with which it may be associated, a proceeding which does not involve the difficult task of determining the migration constant of the compound. Thus, taking the specific ionic velocity of hydrogen as 0.00032 cm. per second, we can find, by determining the conductivity of dilute solutions of any acid, the specific velocity of the acid radicle involved. Or again, since we know the specific velocity of silver, we can find the velocities of a series of acid radicles at great dilution by measuring the conductivity of their silver salts.

By such methods W. Ostwald, C. Bredig and other observers have found the specific velocities of many ions both of inorganic and organic compounds, and examined the relation between constitution and velocity. The velocity of elementary ions is found to be a periodic function of the atomic weight, similar elements lying on corresponding portions of a curve drawn to express the relation between these two properties. Such a curve much resembles that giving the relation between atomic weight and viscosity in solution. For complex ions the velocity is largely an additive property; to a continuous additive change in the composition of the ion corresponds a continuous but decreasing change in the velocity. The following table gives Ostwald’s results for the formic acid series:

**Nature of Electrolytes.** We have as yet said nothing about the fundamental cause of ionic activity, nor considered why, for example, a solution of potassium chloride is a good conductor, while a solution of sugar allows practically no current to pass.

All the preceding account of the subject is, then, independent of any view we may take of the nature of electrolytes, and stands on the basis of direct experiment. Nevertheless, the facts considered point to a very definite conclusion. The specific velocity of an ion is independent of the nature of the opposite ion present, and this suggests that the ions themselves, while travelling through the liquid, are dissociated from each other. Further evidence, pointing in the same direction, is furnished by the fact that since the conductivity is proportional to the concentration at great dilution, the equivalent-conductivity, and therefore the ionic velocity, is independent of it. The importance of this relation will be seen by considering the alternative to the dissociation hypothesis. If the ions are not permanently free from each other their mobility as parts of the dissolved molecules must be secured by continual interchanges. The velocity with which they work their way through the liquid must then increase as such molecular rearrangements become more frequent, and will therefore depend on the number of solute molecules, i.e. on the concentration. On this supposition the observed constancy of velocity would be impossible. We shall therefore adopt as a working hypothesis the theory, confirmed by other phenomena (see Electrolysis), that an electrolyte consists of dissociated ions.

It will be noticed that neither the evidence in favour of the dissociation theory which is here considered, nor that described in the article Electrolysis, requires more than the effective dissociation of the ions from each other. They may well be connected in some way with solvent molecules, and there are several indications that an ion consists of an electrified part of the molecule of the dissolved salt with an attendant atmosphere of solvent round it. The conductivity of a salt solution depends on two factors—(1) the fraction of the salt ionized; (2) the velocity with which the ions, when free from each other, move under the electric forces. When a solution is heated, both these factors may change.

The coefficient of ionization usually, though not always, decreases; the specific ionic velocities increase. Now the rate of increase with temperature of these ionic velocities is very nearly identical with the rate of decrease of the viscosity of the liquid. If the curves obtained by observations at ordinary temperatures be carried on they indicate a zero of fluidity and a zero of ionic velocity about the same point, 38.5° C. below the freezing point of water (Kohlrausch, Sitz. preuss. Akad. Wiss., 1901, 42, p. 1026). Such relations suggest that the frictional resistance to the motion of an ion is due to the ordinary viscosity of the liquid, and that the ion is analogous to a body of some size urged through a viscos medium rather than to a particle of molecular dimensions finding its way through a crowd of molecules of similar magnitude.

From this point of view W. K. Bousfield has calculated the sizes of ions on the assumption that Stokes’s theory of the motion of a small sphere through a viscous medium might be applied (Zeits. phys. Chem., 1905, 55, p. 257; Phil. Trans. A, 1906, 206, p. 101). The radius of the potassium or chlorine ion with its envelope of water appears to be about 1.2 X 10⁻⁸ centimetres.

For the bibliography of electrolytic conduction see Electrolysis. The books which deal more especially with the particular subject of the present article are Das Leitvermögen der Elektrolyte, by F. Kohlrausch and L. Holborn (Leipzig, 1898), and The Theory of Solution and Electrolysis, by W. C. D. Whetham (Cambridge, 1902).

**III. Electric Conduction through Gases**

A gas such as air when it is under normal conditions conducts electricity to a small but only to a very small extent, however small the electric force acting on the gas may be. The electrical conductivity of gases not exposed to special conditions is so small that it was only definitely established in the early years of the 20th century, although it had engaged the attention of physicists for more than a hundred years. It had been known for a long time that a body charged with electricity slowly lost its charge even when insulated with the greatest care, and though longer more precise experiments showed that about one sheet of paper was removed from the charged body before the leak of electricity took place through the air, the general view seems to have been that it was due to almost unavoidable defects in the insulation or to dust in the air, which after striking the charged body was repelled from it and went off with some of the charge.

C. A. Coulomb, who made some very careful experiments which were published in 1785 (Mém. de l'Acad. des Sciences, 1785, p. 621), came to the conclusion that after allowing for the leakage along the threads which supported the charged body there was a balance, over which he attributed to leakage through the air. His view was that when the molecules of air come into contact with a charged body some of the electricity goes on to the molecule, which are then repelled from the body carrying their charge with them. We shall see later that this explanation is not tenable. C. Matteucci (Ann. chim. phys., 1830, 28, p. 390) in 1850 came to the conclusion that the electricity from a charged body passes through the air; he was the first to prove it.
CONDUCTION, ELECTRIC

865

that the leak at which electricity escapes is less when the pressure of the gas is low than when it is high. He found that the rate was the same whether the charged body was surrounded by air, carbonic acid or hydrogen. Subsequent investigations have shown that the rate in hydrogen is in general much less than in air. Thus in 1872 E. G. Warburg (Pogg. Ann., 1872, 145, p. 578) found that the leak through hydrogen was only one-half of that through air: he confirmed Matteucci’s observations on the effect of pressure on the rate of leak, and also found that it was the same whether the gas was dry or damp. He was inclined to attribute the leak to dust in the air, a view which was strengthened by an experiment of J. W. Hittorf’s (Wied. Ann., 1876, 7, p. 505), in which a small care-fully insulated electroscopie, placed in a small vessel filled with carefully filtered gas, retained its charge for several days; we know now that this was due to the smallness of the vessel and not to the absence of dust, as it has been proved that the rate of leak in small vessels is less than in large ones.

Great light was thrown on this subject by some experiments on the rates of leak from charged bodies in closed vessels made almost simultaneously by H. Geitel (Phys. Zeitz., 1900, 2, p. 116) and C. T. R. Wilson (Proc. Camb. Philos. Soc., 1900, 11, p. 32). These observers established that (1) the rate of escape of electricity in a closed vessel is much smaller than in the open, and the larger the vessel the greater is the rate of leak; and (2) the rate of leak does not increase in proportion to the differences of potential between the charged body and the walls of the vessel: the rate soon reaches a limit beyond which it does not increase, however much the potential difference may be increased, provided, of course, that this is not great enough to cause sparks to pass from the charged body. On the assumption that the maximum leak is proportional to the volume, Wilson’s experiments, which were made in vessels less than 1 litre in volume, showed that in dust-free air at atmospheric pressure the maximum quantity of electricity which can escape in one second from a charged body in a closed vessel of V cubic centimetres is about \( 10^{-5} \) electrostatic units. E. Rutherford and S. T. Allan (Phys. Zeitz., 1902, 3, p. 225), working in Montreal, obtained results in close agreement with this. Working between pressures of from 43 to 743 millimetres of mercury, Wilson showed that the maximum rate of leak is very approximately proportional to the pressure; it is thus exceedingly small when the pressure is low—a result illustrated in a striking way by an experiment of Sir W. Crookes (Proc. Roy. Soc., 1879, 28, p. 347) in which a pair of gold leaves retained an electric charge for several months in a very high vacuum. Subsequent experiments have shown that it is only in very small vessels that the rate of leak is proportional to the volume and to the pressure; in large vessels the rate of leak per unit volume is considerably smaller than in small ones. In small vessels the maximum rate of leak in different gases, is, with the exception of hydrogen, approximately propor-tional to the density of the gas. Wilson’s results on this point are shown in the following table (Proc. Roy. Soc., 1901, 60, p. 277):

The rate of leak of electricity through gas contained in a closed vessel depends to some extent on the material of which the walls of the vessel are made: thus it is greater, other circumstances being the same, when the vessel is made of lead than when it is made of aluminum. It also varies, as Campbell and Wood (Phil. Mag., 1896, 13, p. 265) have shown, with the time of the day, having a well-marked minimum at about 3 o’clock in the morning: it also varies from month to month. Rutherford (Phys. Rev., 1903, 16, p. 183), Cooke (Phil. Mag., 1903, 6, p. 403) and M’Clenan and Burton (Phys. Rev., 1903, 16, p. 184) have shown

that the leak in a closed vessel can be reduced by about 30% by surrounding the vessel with sheets of thick lead, but that the reduction is not increased beyond this amount, however thick the lead sheets may be. This result indicates that part of the leak is due to a very penetrating kind of radiation, which can get through the thin walls of the vessel but is stopped by the thick lead. A large part of the leak we are describing is due to the presence of radioactive substances such as radium and thorium in the earth’s crust and in the walls of the vessel, and to the gaseous radioactive emanations which diffuse from them into the atmosphere. This explains the very interesting effect discovered by J. Elster and H. Geitel (Phys. Zeitz., 1901, 2, p. 560), that the rate of leak in caves and cellars where the air is stagnant and only renewed slowly is much greater than in the open air. In some cases the difference is very marked; thus they found that in the cave called the Baumannshöhle in the Harz mountains the electricity escaped at seven times the rate it did in the air outside. In caves and cellars the radioactive emanations from the walls can accumulate and are not blown away as in the open air.

The electrical conductivity of gases in the normal state is, as we have seen, exceedingly small, so small that the investigation of its properties is a matter of considerable difficulty; there are, however, many ways by which the electrical conductivity of a gas can be increased so greatly that the investigation becomes comparatively easy. Among such methods are raising the temperature of the gas above a certain point. Gases drawn from the neighbourhood of flames, electric arcs and sparks, or glowing pieces of metal or carbon are conductors, as are also gases through which Röntgen or cathode rays or rays of positive electricity are passing; the rays from the radioactive metals, radium, thorium, polonium and actinium, produce the same effect, as does also ultra-violet light of exceedingly short wave-length. The gas, after being made a conductor of electricity by any of these means, is found to possess certain properties; thus it retains its conductivity for some little time after the agent which made it a conductor has ceased to act, though the conductivity diminishes very rapidly and finally gets too small to be appreciable.

This and several other properties of conducting gas may readily be proved by the aid of the apparatus represented in fig. 5.

![FIG. 5](image-url)

V is a testing vessel in which an electroscope is placed. Two tubes A and C are fitted into the vessel, A being connected with a water pump, while the far end of C is in the region where the gas is exposed to the agent which makes it a conductor of electricity. Let us suppose that the gas is made conducting by Röntgen rays produced by a vacuum tube which is placed in a box, covered except for a window at B with lead so as to protect the electroscope from the direct action of the rays. If a slow current of air is drawn by the water pump through the testing vessel, the charge on the electroscope will gradually leak away. The leak, however, ceases when the current of air is stopped. This result shows that the gas retains its conductivity during the time taken by it to pass from one end to the other of the tube C.

The gas loses its conductivity when filtered through a plug of glass-wool, or when it is made to bubble through water. This can readily be proved by inserting in the tube C a plug of glass-wool or a water trap; then if by working the pump a little harder the same current of air is produced as before, it will be found that the electroscope will now retain its charge, showing that the conductivity can, as it were, be filtered out of the gas.
The conductivity can also be removed from the gas by making the gas traverse a strong electric field. We can show this by replacing the tube C by a metal tube with an insulated wire passing down the axis of the tube. If there is no potential difference between the wire and the tube then the electroscope will leak when a current of air is drawn through the vessel, but if the leak is closed then the fact that the surface electric field removes the conductivity from the gas.

The attraction and the repulsion of the minor signs being equal. Since the gas is a whole is not electrified either positively or negatively, there must be both negative and positive charges in the gas, the amount of electricity of one sign being equal to that of the other. We are thus led to the conclusion that the conductivity of the gas is due to electrified particles being mixed up with the gas, some of these particles having charges of positive electricity, others of negative. These electrified particles are called ions, and the process by which the gas is made a conductor is called the ionization of the gas. We shall show later that the charges and masses of the ions can be determined, and that the gaseous ions are not identical with those met with in the electrolysis of solutions.

One very characteristic property of conduction of electricity through a gas is the relation between the current through the gas and the electric force which gave rise to it. This relation is not in general that expressed by Ohm's law, which always, as far as our present knowledge extends, expresses the relation for conduction through metals and electrolytes. With gases, on the other hand, it is only when the current is very small that Ohm's law is true. If we represent graphically by means of a curve the relation between the current passing between two parallel metal plates separated by ionized gas and the difference of potential between the plates, the curve is of the character shown in fig. 6 when the ordinates represent the square of the abscissae the difference of potential between the plates. We see that when the potential difference is very small, i.e., close to the origin, the curve is approximately straight, but that soon the current increases much less rapidly than the potential difference, and that a stage is reached when no appreciable increase of current is produced when the potential difference is increased; when this stage is reached the current is constant, and this value of the current is called the "saturation" value.

When the potential difference approaches the value at which sparks would pass through the gas, the current again increases with the potential difference; thus the curve representing the relation between the current and potential difference over very wide ranges of potential difference has the shape shown in fig. 7; curves of this kind have been obtained by von Schweidler (Wien. Ber., 1899, p. 273), and J. E. Townsend Phil. Mag., 1901 [6], p. 198). We shall discuss later the causes of the rise in the current with large potential differences, when we consider ionization by collision.

The general features of the earlier part of the curve are readily explained on the ionization hypothesis. On this view the X-rays or other ionizing agent acting on the gas between the plates, produces positive and negative ions at a definite rate. Let us suppose that $g$ positive and $q$ negative ions are by this means produced per second between the plates; these under the electric force will tend to move, the positive ones to the negative plate, the negative ones to the positive. Some of these ions will reach the plate, others before reaching the plate will get so near one of the opposite sign that the attraction between them will cause them to unite and form an electrically neutral system; when they do this they end their existence as ions. The current between the plates is proportional to the number of ions which reach the plates per second. Now it is evident that we cannot go on taking ions out of the gas than are produced; thus we cannot, when the current is steady, have more than $g$ positive ions driven to the negative plate per second, and the same number of negative ions to the positive. If each of the positive ions carries a charge of $c$ units of positive electricity, and if there is an equal and opposite charge on each negative ion, then the maximum number of electricity which can be given to the plates per second is $gc$, and this is equal to the saturation current. Thus if we measure the saturation current, we get a direct measure of the ionization, and this does not require us to know the value of any quantity except the constant charge on the ion. If we attempt to deduce the amount of ionization by measurements of the current before it was saturated, we should require to know in addition the velocity with which the ions move under a given electric force, the time that elapses between the liberation of an ion and its combination with one of the opposite sign, and the potential difference between the plates. Thus if we wish to measure the amount of ionization in a gas we should be careful to see that the current is saturated.

The difference between conduction through gases and through metals is shown in a striking way when we use potential differences large enough to produce the saturation current. Suppose we have got a potential difference between the plates more than sufficient to produce the saturation current, and let us increase the distance between the plates. If the gas were to act like a metallic conductor this would diminish the current, because the greater length would involve a greater resistance in the circuit.

In the case we are considering the separation of the plates will increase the current, because now there is a larger volume of gas exposed to the rays; there are therefore more ions produced, and as the saturation current is proportional to the number of ions the saturation current is increased. If the potential difference between the plates were much less than that required to saturate the current, then increasing the distance would diminish the current; the gas for such potential differences obeys Ohm's law and the behaviour of the gaseous resistance is therefore similar to that of a metallic one.

In order to produce the saturation current the electric field must be strong enough to drive each ion to the electrode before it has time to enter into combination with one of the opposite sign. Thus when the plates in the preceding example are far apart, it will take a larger potential difference to produce this current than when the plates are close together. The potential difference required to saturate the current will increase as the square of the distance between the plates, for if the ions are to be delivered in a given time to the plates their speed must be proportional to the distance between the plates. But the speed is proportional to the electric force acting on the ion; hence the electric force must be proportional to the distance between the plates, and as in a uniform field the potential difference is equal to the electric force multiplied by the distance between the plates, the potential difference will vary as the square of this distance.

The potential difference required to produce saturation will, other circumstances being the same, increase with the amount of ionization, for when the number of ions is large and they are crowded together, the time which will elapse before a positive ion combines with a negative will be smaller than when the number of ions is small. The ions have therefore to be removed more quickly from the gas when the ionization is great than when it is small; thus they must move to a higher speed and must therefore be acted upon by a larger force.
When the ions are not removed from the gas, they will increase until the number of ions of one sign which combine with ions of the opposite sign in any time is equal to the number produced by the ionizing agent in that time. We can easily calculate the number of free ions at any time after the ionizing agent has commenced to act.

Let \( q \) be the number of ions (positive or negative) produced in one cubic centimetre of the gas per second by the ionizing agent, \( n_1, n_2 \), the number of free positive and negative ions respectively per cubic centimetre of the gas. The number of collisions between positive and negative ions per second per cubic centimetre of gas is proportional to \( n_1 n_2 \). If a certain fraction of the collisions between the positive and negative ions result in the formation of an electrically neutral system, the number of ions which disappear per second per cubic centimetre will be equal to \( a n_1 + n_2 \), where \( a \) is a quantity which is independent of \( n_1, n_2 \); hence if \( t \) is the time since the ionizing agent was applied to the gas, we have

\[
\frac{dn_1}{dt} = q - an_1, \quad \frac{dn_2}{dt} = q - an_2,
\]

Thus \( n_1 - n_2 \) is constant, so that if the gas is uncharged to begin with, \( n_1 \) will always equal \( n_2 \). Putting \( n_1 = n_2 = n \) we have

\[
\frac{dn_1}{dt} = q - an, \quad \frac{dn_2}{dt} = q - an.
\]

The solution of which is, since \( n = 0 \) when \( t = 0 \),

\[
\int n_1 = k = \sqrt{q/a}.
\]

If \( k^2 = q/a \), the number of ions when the gas has reached a steady state is obtained by putting \( n_1 \) in the preceding equation, and is therefore given by the equation

\[
n_1 = k = \sqrt{q/a}.
\]

We see from equation (1) that the gas will not approximate to its steady state until \( 2k/\sqrt{a} \) or with \( 2k(\sqrt{a} \) a measure of the time taken by the gas to reach a steady state when exposed to an ionizing agent; as this time varies inversely as \( \sqrt{a} \) we see that when the ionization is feeble it may take a very considerable time for the gas to reach a steady state. Thus in the case of our atmosphere where the production of ions is only at the rate of about 30 per cubic centimetre per second, and where, as we shall see, \( a \) is about 100, it would take some minutes for the ionization in the air to get into a steady state if the ionizing agent were suddenly applied.

We may use equation (1) to determine the rate at which the ions disappear when the ionizing agent is removed. Putting \( q = 0 \) in this equation we get

\[
\frac{dn_1}{dt} = -an.
\]

Hence

\[
n = n_1 (1 + tan),
\]

where \( n \) is the number of ions when \( t = 0 \). Thus the number of ions falls to one-half its initial value in the time \( 1/\sqrt{a} \).

| Townsend, McLung, Langevin, Retschinsky, Hendred. |
|----------------------|----------------------|----------------------|----------------------|----------------------|
| Air                  | 3420                | 3380                | 3200                | 4140                |

| CO₂                  | 3500                | 3480                | 3490                | 3400                |
| H₂                   | 3120                | 3290                | 3290                | 3290                |

The gases in these experiments were carefully dried and free from dust; the apparent value of \( a \) is much increased when dust or small droplets of water are present in the gas, for then the ions get caught by the dust particles, the mass of a particle is so great compared with that of an ion that they are practically immovable under the action of the electric field, and so the ions clinging to them escape detection when electrical methods are used. Taking as an example, 3.5 X 10⁻¹⁰ m², we see that a is about 1.2 X 10⁻⁸, so that the number of recombinations in unit time between \( n \) positive and \( n \) negative ions in unit volume is 1.2 X 10⁻¹⁸. The kinetic theory of gases shows that if \( n \) molecules of air are present per cubic centimetre there will be 1.2 X 10⁻⁹ collisions per second or 3.5 X 10⁻⁶ at a temperature of 0°C. Thus we see that the number of recombinations between oppositely charged ions is enormously greater than the number of collisions between molecules of Wetral molecules. We shall see that the difference in size between the ion and the molecule is not nearly sufficient to account for the difference between the collisions in the two cases; the difference is due to the force between the oppositely charged ions, which drags ions into collisions which but for this force would have missed each other.

Several methods have been used to measure \( a \). In one method air, exposed to some ionizing agent at one end of a long tube, is slowly sucked through the tube and the saturation current measured at different points along the tube. These currents are proportional to the values of \( n \) at the place of observation; if we know the distance of this place from the end of the tube when the gas was first ionized and the velocity of the stream of air, we can find \( a \) in equation (3), and knowing the value of \( a \) we can deduce the value of \( n \) from the equation

\[
\frac{n_1}{n} - \frac{n_2}{n} = a(t_1 - t),
\]

where \( n_1, n_2 \) are the values of \( n \) at the times \( t_1, t_2 \) respectively.

In this method the tubes ought to be so wide that the loss of ions by diffusion is negligible. There are other methods which involve the knowledge of the speed with which the ions move under the action of known electric forces; we shall defer the consideration of these methods until we have discussed the question of these speeds.

In measuring the value of \( a \) it should be remembered that the theory of the methods supposes that the ionization is uniform throughout the gas. If the total ionization throughout a gas remains constant, but instead of being uniformly distributed is concentrated in patches, it is evident that the ions will recombine more quickly in the second case than in the first, and that the value of \( a \) will be different in the two cases. This probably explains the large values obtained by Retschinsky, who ionized the gas by the rays from radium, a method which produces very patchy ionization.

Variation of a with the Pressure of the Gas.—All observers agree that there is little variation in \( a \) with the pressures for between 10 to 40 cm of mercury and 1 atmosphere. However, the value of \( a \) seems to diminish with the pressure. Langevin (Ann. chim. phys., 1903, 28, p. 287) found that at a pressure of \( 1 \) of an atmosphere the value of \( a \) was about \( 1 \) of its value at atmospheric pressure.

Variation of a with the Temperature.—Erikson (Phil. Mag., Aug. 1909) has shown that the value of \( a \) for air increases as the temperature diminishes, and that at the temperature of liquid air —180°C. it is more than twice as great.

Since, as we have seen, the recombination is due to the coming together of the positive and negative ions under the influence of the electrical attraction between them, it follows that a large electrical force is necessary to overcome this attraction and to keep the ions apart and hence diminish the coefficient of recombination. Simple considerations, however, will show that it would require exceedingly strong electrical fields to produce an appreciable effect. The value of \( a \) for 0°C is about 2 X 10⁻⁵, and it is more than 100 times greater when the attraction is stronger, say \( 10 \) or \( 1 \); in this case the attraction must be at least 10⁴ or 10⁵ volts per centimetre, a force which could not be applied to gas at atmospheric pressure without producing a spark.

Diffusion of the Ions.—The ionized gas acts like a mixture of gases, the ions corresponding to two different gases, the non-ionized gas to a third. If the concentration of the ions is not uniform, they will move toward the non-ionized gas to produce a more uniform distribution. A very valuable series of determinations of the coefficient of diffusion of ions through various gases has been made by Townsend (Phil. Trans., 1900, A, 193, p. 129). The method used was to suck the ionized gas through narrow tubes by means of a vacuum pump, and this was opposed to gas at atmospheric pressure without producing a spark.

It is interesting to compare with these coefficients the values of \( D \) when various gases diffuse through each other. \( D \) for hydrogen through air is 0.34, for oxygen through air 177, for the vapour of
isobutyl amide through air. We thus see that the velocity of diffusion of ions through air is much less than that of the simple gas, but that it is quite comparable with that of the vapours of some complex organic compounds.

The preceding fact shows that the negative ions diffuse more rapidly than the positive, especially in dry gases. The superior mobility of the negative ions was observed first by Zeleny (Phil. Mag., 1898 [5], 46, p. 120), who showed that the velocity of the negative ions under an electric field is greater than that of the positive. It will be seen that the difference in the mobility of the negative and positive ions is much more pronounced in dry gases than in moist. The difference in the rates of diffusion of the positive and negative ions is the reason why ionized gas, in which, to begin with, the positive and negative charges were of equal amounts, sometimes becomes electrified even although the gas is not acted upon by electric forces. Thus, for example, if such gas be blown through narrow tubes, it will be positively electrified when it comes to rest, but if the gas is more rapidly than the positive, the gas in its passage through the tubes will lose by diffusion more negative than positive ions and hence will emerge positively electrified. Zeleny showed that this effect does not occur where there is in carbonic acid gas, the positive and negative ions diffuse not at the same rates. Townsend (loc. cit.) showed that the coefficient of diffusion of the ions is the same whether the ionization is produced by Röntgen rays, radioactive substances, ultra-violet light, or electric sparks. The ions produced by chemical reactions and in flames are much less mobile; thus, for example, Bloch (Ann. chim. phys., 1905 [8], 4, p. 28) found that for the ions produced by drawing air over phosphorus the value of \( \alpha /e \) was between 1 and 6 instead of 3000, the value when the air was ionized by Röntgen rays.

**Velocity of Ions in an Electric Field.**—The velocity of ions in an electric field, which is of fundamental importance in conduction, is very closely related to the coefficient of diffusion. Measurements of this velocity for ions produced by Röntgen rays have been made by Rutherford (Phil. Mag., [5], 44, p. 422), Zeleny (Phil. Mag., [5], 46, p. 401), Langewiesche (Ann. chem. Phys., 1903, 25, p. 280), Phillips (Phil. Roy. Soc., 78, A, 167), and Wilisch (Phil. Trans., 1900, 209, p. 249). The ions produced by radioactive substance have been investigated by Rutherford (Phil. Mag., [5], 47, p. 109) and by Franck and Pohl (Verh. deutsch. phys. Gesell., 1907, 9, p. 69), and the negative ions produced when ultraviolet light falls on a metal plate by Rutherford (Proc. Camb. Phil. Soc., 9, p. 401). H. A. Wilson (Phil. Trans., 1907, p. 409), Marx (Ann. de Phys., 11, p. 765), Moreau (Journ. de Phys., 11, p. 558), Ann. Chim. Phys., 7, 30, p. 5) and Gold (Proc. Roy. Soc., 79, p. 43) have investigated the velocities of ions produced by putting various salts into flames; McClelland (Phil. Mag., 46, p. 29) the velocity of the ions in gases sucked from the neighbourhood of flames and arcs; Townsend (Proc. Camb. Phil. Soc., 9, p. 345) and Bloch (loc. cit.) the velocity of ions produced by chemical reaction; and Chattaway (Phil. Mag., [5], 43, p. 401) the velocity of the ions produced when electricity escapes from a sharp needle point into a gas.

Several methods have been employed in these investigations. The one most frequently employed is to find the electromotive intensity required to force an ion against the stream of gas moving with a known velocity parallel to the lines of electric force. Thus, of two perforated plane electrodes vertically over each other, suppose the lower to be positively electrified, and suppose that the gas is streaming vertically downwards with the velocity \( V \); then unless the upward velocity of the positive ion is greater than \( V \), no positive electricity will reach the upper plate. If we increase the strength of the field between the plates, and hence the upward velocity of the positive ion, until the positive ions just begin to reach the upper plate, we know that with this strength of field the velocity of the positive ion is equal to \( V \). By this method, which has been used by Rutherford, Zeleny and H. A. Wilson, the velocity of ions in fields of various strengths has been determined.

The arrangement used by Zeleny is represented in fig. 8. P and Q are square brass plates. They are bored through their centres, and into the holes in them are fitted two tubes, A and B, and the space between the plates being covered in so as to form a closed box. K is a piece of wire gauge completely covering the opening in Q; T is an insulated piece of wire gauge nearly but not quite filling the opening in the plate P, and connected with one pair of quadrants of an electrometer \( E \). A plug of glass wool C filters out the dust from a stream of gas which enters the vessel by the tube D and leaves it by F; this plug also makes the velocity of the flow of the gas uniform across the section of the tube. The Röntgen rays to ionize the gas were produced by a bulb at O, the bulb and coil being in a lead-covered box, with an aluminium window through which the rays passed. Q is connected with one pole of a battery of cells, P and the other pole of the battery are put to earth. The changes in the potential of T are due to ions giving up the charges to it. With a given velocity of air-blast the potential of T was found not to change unless the difference of potential between P and Q exceeded a critical value. The field corresponding to this critical value thus made the ions move with the known velocity of the blast.

**FIG. 8.**

Another method which has been employed by Rutherford and McClelland is based on the action of an electric field in destroying the conductivity of gas streaming through it. Suppose that BAB, DD (fig. 9) are a system of parallel plates boxed in such a stream of gas, after flowing between BB, DD, passes between DD without any loss of gas in the interval. Suppose the plates DD are insulated, and connected with one pair of quadrants of an electrometer, by charging up the plates DD to a sufficiently high potential we can drive all the positive ions out which enter the system DD against the plates DD; this will cause a deflexion of the electrometer, which in one second will be proportional to the number of positive ions which have entered the system in that time. If we charge A up to a high potential, B being put earth, we shall have the electric force of the electrometer placed against the plates DD, which is less than the original. Hence the plates DD in the system will be charged positively, because some of the positive ions in their passage through BAB are driven against the plates B. If \( a \) is the velocity along the lines of force in the uniform electric field between A and B, and \( t \) the time it takes for the gas to pass through BAB, then all the positive ions within a distance of the plates B will be driven up against these plates, and thus if the positive ions are equally distributed through the gas, the number of given strength. By changing A and C negatively instead of positively we can arrive at the velocity of the negative ion. In practice it is more convenient to use cylindrical tubes with coaxial wires instead of the systems of parallel plates used in this case. The calculation of the velocity of the ions from the observations is a little more complicated, inasmuch as the electric field is not uniform between the tubes.

A method which gives very accurate results, though it is only applicable in certain cases, is the one used by Rutherford to measure the velocity of the negative ions produced close to a metal plate by the incidence on the plate of ultra-violet light. The principle of the method is as follows:—AB (fig. 10) is an insulated horizontal plate of polished zinc. When this plate is charged to a high potential the plate CD is connected with an alternating current dynamo, which produces a simply-periodic potential difference between AB and CD, the other pole being put to earth. The other pair of quadrants being attached to the plate CD at a higher potential than AB, then the negative ions from AB will move towards CD, and will continue to do so as long as the potential of CD is higher than that of AB. If, however, the potential difference changes sign before the negative ions reach CD, these ions will go back to AB. Thus AB will not

**FIG. 9.**

**FIG. 10.**
CONDUCTION, ELECTRIC

Suppose we diminish the vertical force by the amount of diminution of the horizontal force. Let the force of the electric field between the charged plates be equal to \( -\frac{kq}{d^2} \) per unit area, where \( k \) is the constant of proportionality, \( q \) is the charge on each plate, and \( d \) is the distance between the plates. The force \( F \) on an ion of charge \( q \) is then \( F = \frac{kq^2}{d^2} \). If \( \theta \) is the angle between the direction of the force and the horizontal, the vertical component of the force on the ion is \( F \cos \theta \), and the horizontal component is \( F \sin \theta \).

Thus the greatest distance the ion can get from the plane is \( 2qL/pd \), and if the distance between the plates is gradually reduced to this value, the plate \( AB \) will begin to lose a negative charge; hence when this happens,

\[
d = 2qL/pd, \quad \text{or} \quad u = pd/2a,
\]

an equation by means of which we can find \( u \).

In this form the method is not applicable when ions of both signs are present, for the charge \( q \) is not constant. In this case, the ion is forced through the gauze by applying a constant electric field, and the passing ion is detected by its ionization of the gas in its path. The ionization is produced by the radioactive substance, and the effect is a glow of ultraviolet light. The ionization is produced by chemical action when the gas is ionized by passing a current through a gas at high pressure.

There are other methods of determining the velocities of the ions, but as these depend on the theory of the conduction of electricity through a gas containing charged ions, we shall consider them in our discussion of that theory.

The velocity of the ions in a gas can be measured by this method. The velocity of the ions in a gas is given by the product of the charge of the ion and the electric field strength. For example, if \( \beta \) and \( \rho \) denote the ionization current and the density of the positive ions, respectively, the velocity of the positive ions is

\[
\beta = \frac{N}{V} = \frac{q}{eV},
\]

where \( N \) is the number of positive ions per cubic centimetre, \( e \) is the elementary charge, and \( V \) is the electric field strength.

CONDUCTION, ELECTRIC

Ions in Gases sucked from Flames.

Velocities varying from 4 to 73° C.

H. A. Wilson (Phil. Trans. 192, p. 499), in his experiments on the condensation of flames and hot gases, in which salts had been put, found that the velocity of the positive ions in flames at a temperature of 2000° C. containing the salts of the alkali metals was 62 cm. per centimetre, while the velocity of the negative ions in a stream of one atmosphere of the same gas was only 7 cm. per centimetre under the same force. The great effect of temperature is also shown in some experiments of McClelland (Phil. Mag. 5, p. 59) on the velocities of the ions in gases drawn from Bunsen flames and found that the velocity of the negative ions, at 5 cm. from the flame, was 230 cm. per centimetre, for a voltage of 1000 cm. and the same voltage was 21 cm. at 14.5 cm. from the flame when the temperature was 105° C. the velocity was only 4 cm. per centimetre.

Our knowledge is therefore confined to the temperature of the ion, and we may derive some information as to the constitution of the ions by calculating the velocity with which a molecule of the gas would move through the electric field if it carried the same charge as the ion.

If we denote by $a$ the number of positive charged ions, by $b$ the number of negative charged ions, and by $D$ the diffusion of the gas if the ion were a free molecule, we have:

$$u = \frac{Xe}{p_r/N},$$

where $X$ represents the coefficient of inter-diffusion of A into B, and $N$ the number of particles of A per cubic centimetre when the pressure is $a$. Let us calculate by this equation the velocity of a molecule of hydrogen which would move through hydrogen if it carried the charge carried by an ion, which we shall prove shortly to be equal to the charge carried by an atom of hydrogen in the electrolysis of solutions. Since $p_r/N$ is independent of the temperature and equal to $A_p/N$, the ion is the number of molecules in a cubic centimetre of gas at atmospheric pressure.

From this we find the coefficient of diffusion of hydrogen into itself, and it is equal to 1.7 Substituting these values we find:

$$u = 1.97 \times 10^4.$$
If $Q$ is the charge received by the plate, 
$$Q = N e = \frac{X}{4\pi} \log \left( 1 + \frac{Q}{eX} \right),$$
where $Q = n e$ is the charge received by the plate when the electric force is large enough to prevent recombination, and $e = 4\pi$. We can find this result by substituting the values of $e$ and hence the value of $Q$ when $R_1 + R_2$ is known.

**Distribution of Electric Force when a Current is passing through an Ionized Gas.**—Let the two plates be at right angles to the axis of $x$; then we may suppose that between the plates the electric intensity $X$ is everywhere parallel to the axis of $x$. The velocities of both the positive and negative ions are assumed to be proportional to $X$. Let $kX, k2X$ represent these velocities respectively; let $n_1, n_2$ be respectively the number of positive and negative ions per unit volume at a point fixed by the co-ordinate $x$; let $q$ be the number of positive or negative ions produced in unit time per unit volume at this point; and let the number of ions which recombin in unit time be $am_1n_2$; then if $e$ is the charge on the ion, the volume density of the electrification is $\left( n_1 - n_2 e \right)$, hence
$$\frac{dX}{dx} = q\left( n_1 - n_2 e \right) \quad \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots
CONDUCTION, ELECTRIC

Since \( \epsilon = 4 \times 10^{-8}, \) \( a = 2 \times 10^{-4}, \) and \( k_1 \) for air at atmospheric pressure \( = 450, \) \( \beta \) is about 2-3 for air at atmospheric pressure and it becomes much greater at lower pressures.

Thus \( X_1 \) is always greater than unity, and the value of the ratio increases from unity to infinity as \( \beta \) increases from zero to infinity. As \( \beta \) does not involve either \( q \) or \( l, \) the ratio of \( X_1 \) to \( X_0 \) is independent of the strength of the current and of the intensity of the ionization.

No general solution of equation (8) has been found when \( k_1 \) is not equal to \( k_2, \) but we can get an approximation to the solution when \( q \) is constant. The equations (1), (2), (3), (4) are satisfied by the values

\[
n_i = n_2 = \frac{(q/n)^l}{e(h_1 + h_2)},
\]

\[
k_1 n_1 x_e = k_2 h_1 + h_2,
\]

\[
k_2 n_2 x_e = \frac{k_1}{h_1 + h_2},
\]

\[
X = \left( \frac{a}{q} \right) \frac{1}{e(h_1 + h_2)}.
\]

These solutions cannot, however, hold right up to the surface of the plates, for across each unit of area, at a point \( P, \) \( k_1/(k_1 + k_2) \) positive ions pass in unit time, and these must all come from the region between \( P \) and the positive plate. If \( \lambda \) is the distance of \( P \) from this plate, this region cannot furnish more than \( \lambda \) positive ions, and only this number if there are no recombinations. Hence the solution cannot hold when \( \lambda < k_1/(k_1 + k_2), \) or where \( \lambda < k_1/(k_1 + k_2)g_e.

Similarly the solution cannot hold nearer to the negative plate than the distance \( k_1/(k_1 + k_2)g_e.

The force in these layers will be greater than that in the middle of the gas, and so the loss of ions by recombination will be smaller in comparison with the loss due to the removal of the ions by the current. If we assume that in these layers the loss of ions by recombination can be neglected, we can by the method of the next article find an expression for the value of the electric force at any point in the layer. This, in conjunction with the value

\[
x_e = \left( \frac{a}{q} \right) \frac{1}{e(h_1 + h_2)}
\]

for the gas outside the layer, will give the value of \( X \) at any point between the plates. It follows from this investigation that if \( X_1 \) and \( X_2 \) are the values of \( X \) at the positive and negative plates respectively, and \( X_0 \) the value of \( X \) outside the layer,

\[
x_1 = x_0 \left( \frac{1}{k_1 h_1} \right)^l, \quad x_2 = x_0 \left( \frac{1}{k_2 h_2} \right)^l,
\]

where \( q = a/\epsilon(\lambda + k_2). \) Langevin found that for air at \( 1 \) atmosphere pressure of 152 mm, \( \epsilon = 0.01, \) at 375 mm, \( \epsilon = 0.06, \) and at 760 mm, \( \epsilon = 0.07. \) Thus at fairly low pressures \( \epsilon \) is large, and we have approximately

\[
x_1 \approx x_0 \left( k_1 h_1 \right)^l, \quad x_2 \approx x_0 \left( k_2 h_2 \right)^l.
\]

Therefore \( X_1/X_2 = h_2/k_2. \)

Or the force at the positive plate is to that at the negative plate as the velocity of the positive ion is to that of the negative ion. Thus the force at the negative plate is greater than that at the positive.

The falls of potential \( V_1, V_2 \) at the two layers when \( 1/e \) is large can be shown to be given by the equations

\[
V_1 = 8\pi^2 \left( \frac{q}{a} \right) \frac{k_1}{k_2^2},
\]

\[
V_2 = 8\pi^2 \left( \frac{q}{a} \right) \frac{k_2}{k_1^2},
\]

hence

\[
V_1/V_2 = k_1^2/k_2^2.
\]

so that the potential falls at the electrodes are proportional to the squares of the velocities of the ions. The change in potential across the layers is proportional to the square of the current, while the potential change between the layers is proportional to the current, the total potential difference between the plates is the sum of these changes, hence the relation between \( V \) and \( i \) will be of the form

\[
V = A i + B i^2.
\]

In this case practically all the current is carried by the negative ions so that \( i \approx n_2 k_2 x_e, \) and therefore \( q = a n_2 k_2 x_e.

Thus

\[
n_2 \approx k_1/k_2 x_e, \quad n_1 \approx q k_2 x_e/a_i.
\]

Therefore

\[
\frac{dX}{dx} \approx 4\pi e^2 q k_2 x_2 \quad \frac{x_2}{a_i} = \frac{8\pi i}{k_2}.
\]

The solution of this equation is

\[
x_2 = \frac{4\pi i}{k_2} + C e^{4\pi e^2 q k_2 x_2 / a_i}
\]

Here \( x \) is measured from the positive electrode; it is more convenient in this case, however, to measure it from the negative electrode. If \( x \) be the distance from the negative electrode at which the electric force is \( X, \) we have from equation (7)

\[
x^2 = \frac{4\pi i}{k_2} + C e^{4\pi e^2 q k_2 x_2 / a_i}
\]

To find the value of \( C \) we see by equation (7) that

\[
\left( \frac{dX}{dx} \right) x = q a n_2 k_2 x_e
\]

hence

\[
\frac{dX}{dx} \approx \frac{1}{k_1 + k_2} \frac{8 n_2 x_e}{a_i}
\]

The right-hand side of this equation is the excess of ionization over recombination in the region extending from the cathode to \( x; \) it must therefore, when things are in a steady state, equal the excess of the number of negative ions which leave this region over those which enter it. The number which leave is \( i/e \) and the number which enter is \( n_2 k_2 x_e \) if \( k_1 \) is the current of negative ions coming from unit area.
of the cathode, as hot metal cathodes emit large quantities of negative electricity $q$ may in some cases be considerable, thus the right hand side of equation is $(i-i_0)/e$. When $x_2$ is large $dx^2/dx = 0$; hence we have from equation

$$X^2 = \frac{a^2}{k_1^2} \left( 1 + \frac{k_1}{k_2} \right)$$

and since $k_1$ is small compared with $k_2$, we have

$$X^2 = \frac{a^2}{k_2^2} \left( 1 + \frac{k_2}{k_1} \right)$$

From the values which have been found for $k_1$ and $k_2$, we know that $\delta_{eK}/a$ is a large quantity, hence the second term inside the bracket will be very small when $eK/a$ is equal to or greater than $i$; thus this term will be very small outside a layer of gas next to the cathode of such thickness the electric force in the gas would be sufficient to ignite the prepared for the purpose, to carry the current: in the case of flames this layer is exceedingly thin unless the current is very large. The value of the electric force in the uniform part of the field is equal to $\frac{eK}{\delta_{eK}/a}$ while when $i_2 = 0$ the force at the cathode itself bears to the uniform force the ratio of $(k_1 + k_2)$ to $k_1$. As $k_2$ is many thousand times $k_1$ the force increases with great rapidity as we approach the cathode. It is a characteristic feature of the passage of electricity through flames and hot gases. Thus in an experiment made by H. A. Wilson with a flame 18 cm. long, the drop of potential within 1 centimetre of the cathode was about twice that in the other 17 cm. of the tube. The drop will be very nearly the same as the current and the potential difference when the velocity of the negative ion is much greater than the positive is very easily obtained. Since the force is uniform and equal to $\frac{eK}{\delta_{eK}/a}$ until we get close to the cathode the fall of potential in the uniform part of the discharge will be very approximately equal to $\frac{i}{\delta_{eK}/a}$, where $l$ is the distance between the electrodes. Close to the cathode, the electric force when $i_2$ is not nearly equal to $i$ is approximately given by the equation

$$X = \frac{i}{eK(k_1 + k_2)} \left( \frac{a}{q} \right) e^{-k_1/2 q}$$

and the fall of potential at the cathode is equal to approximately $\int_{i_0}^{x_2} xdx$, that is to

$$V = \frac{a}{q} \frac{i}{k_1} \left( \frac{a}{q} \right) e^{-k_1/2 q}$$

The potential difference between the plates is the sum of the fall of potential in the uniform part of the discharge plus the fall at the cathode, hence

$$V = \frac{a}{q} \frac{i}{k_1} \left( \frac{a}{q} \right) e^{-k_1/2 q}$$

The fall of potential at the cathode is proportional to the square of the current, while the fall in the rest of the circuit is directly proportional to the current. In the case of flames or gases, the fall of potential at the cathode is much greater than that in the rest of the circuit, so that in such cases the current through the gas varies nearly as the square root of the potential difference. The equation we have just obtained is of the form

$$V = A + Bx$$

and H. A. Wilson has shown that a relation of this form represents the results of his experiments on the conduction of electricity through flames. The expression for the fall of potential at the cathode is inversely proportional to $a^2$, $q$ being the number of ions produced per cubic centimetre per second close to the cathode; thus any increase in the ionization at the cathode will diminish the potential fall at the cathode, and as practically the whole potential difference between the electrodes occurs at the cathode, a diminution in the potential fall there will be much more important than a diminution in the electric force in the uniform part of the discharge, when the force is comparatively insignificant. This consideration explains a very striking phenomenon discovered many years ago by Hittorf, who found that if he put a piece of a volatile salt into the flame, it produced little effect upon the current, unless it was placed close to the cathode where it gave rise to an enormous increase in the current, sometimes increasing the current more than a hundredfold. The production of the salt increases very greatly the number of ions produced, so that $q$ is much greater for a salted flame than for a plain one. Thus Hittorf's result coincides with the conclusions we have drawn from the theory of this class of conduction.

The fall of the potential proportional to $i^2$, where $a$ is the stream of negative electricity which comes from the cathode itself, thus as $i$ increases the fall of potential at the cathode diminishes and the current sent by a given potential difference through the gas increases. Now all metals give out negative particles, $(i-i_0)$ will for a given value of $i$ be smaller than if the metal only emitted a small number of particles; thus the cathode fall will be smaller for the metal with the greater emissivity, and the relation between the potential difference and the current will be different in the two cases. These considerations are confirmed by the experiments of H. A. Wilson, for the current through a series of electrodes immersed in a flame depends to a great extent upon the metal of which the electrodes are made. Thus Pettiinni (Acc. dei Lincei 52, p. 118) found that, ceteris paribus, the current between two parallel carbon electrodes was about five times that between copper, ones. If one electrode was carbon and the other iron, the current when the carbon was cathode and the iron anode was more than 100 times the current when the electrodes were reversed. The emission of negative particles by some metallic oxides, notably those of calcium and magnesium, we may perhaps best account for if we suppose that the negative electrode is exposed to ultra-violet light. In such cases if the electrode at which the ionization occurs is the positive electrode, all the ions will be positively charged, while if it is the negative electrode the ionization produces uniformly charged ions. In such a case the current is exceedingly simple. Suppose the electrodes are parallel planes at right angles to the axis of $x$; let $X$ be the electric force at a distance $x$ from the electrode where the ionization occurs, $n$ the number of ions produced per cubic centimetre, $k$ the velocity of the ion under unit electric force, $e$ the charge on an ion, and $i$ the current per unit area of the electrode. Then we have $dx/dx = 4nme$, and if $i$ is the velocity of the ion

$$V = \frac{4nme}{k}$$

The fall of potential over the distance $x$ is $\frac{4nme}{k}$, that is to say, the total fall of potential, which is $i$, is equal to $4nme/k$. The equation is $i = \frac{4nme}{k}$. We shall show that when the current is the farthest saturation value, $C$ is very small compared with $x$, so that the preceding equation becomes

$$V = \frac{4nme}{k}$$

To show that for small currents $C$ is small compared with $\frac{4nme}{k}$, consider the case when the ionization is confined to a thin layer, thickness $d$ close to the electrode, in that layer let $n_0$ be the value of $n$, then $\frac{4nme}{k} = \frac{4nme}{k} + \frac{4nme}{k}$.

Therefore $x_0 = \frac{4nme}{k}$, and

$$C = \frac{4nme}{k} + \frac{4nme}{k}$$

Since $q/a$ is, as we have seen, less than unity, $C$ will be small compared with $x$, if $i/eq_{i+d}$ is small compared with $i$. If $i_0$ is the saturation current, $q = i_0/\delta_{eK}/a$, so that the former expression may be written as $i_0 = 4nme/e$. We have $4nme/e$ and $i_0/eq_{i+d}$ is small compared with $i_0$, and therefore a fortiori compared with $i$, so that we are justified in using this expression in equation (1).

From equation (2) we see that the current increases as the square of the potential difference. Here an increase in the potential difference produces a much greater percentage increase than in conduction through metals, where the current is proportional to the potential difference. When the ionization is distributed through the gas, we have seen that the ionization is proportional to the square root of the potential, and so increases more slowly with the potential difference than currents through metals. From equation (1) the current is inversely proportional to the cube of the distance. Since the current falls off with the greatest rapidity as this distance is increased. We may note that for a given potential difference the expression for the current does not involve $q$, the rate of production of the ions at the electrode, in other words, we have seen that the number of ions produced on the electrode is proportional to the square root of the potential, and so increases more slowly with the potential difference than currents through metals. From equation (1) the potential is inversely proportional to $ii_0$ is the current that falls off with the greatest rapidity as the distance is increased. We may note that for a given potential difference the expression for the current does not involve $q$, the rate of production of the ions at the electrode, in other words, we have seen that the number of ions produced on the electrode is proportional to the square root of the potential, and so increases more slowly with the potential difference than currents through metals. From equation (1) the current is inversely proportional to the cube of the distance.
to the electrode where there is no ionization. A plate of metal will be as effectual as one made of a non-conductor, and thus we get the remarkable result that by interposing a plate of an excellent conductor like copper or silver between the electrode, we can entirely stop the drops. This experiment can be repeated with the hot plate as the electrode at which the ionization takes place: then if the other electrode is cold the current which passes when the hot plate is cathode can be entirely stopped by interposing a cold metal plate between the electrodes.

Methods of counting the Number of Ions.—The detection of the ions and the estimation of their number in a given volume is much facilitated by the property they possess of promoting the condensation of water-drops in dust-free air supersaturated with water vapour. If such air contains no ions, then it requires about an eightfold supersaturation before any water-drops are formed; and if, however, ions are present C. T. R. Wilson (Phil. Trans. 189, p. 265) has shown that a sixfold supersaturation is sufficient to cause the water vapour to condense round the ions and to fall down as raindrops. The absence of the drops when no ions are present is due to the curvature of the drops combined with the surface tension causing, as Lord Kelvin showed, the evaporation from a small drop to be exceedingly rapid, so that even if a drop of water were formed the evaporation would be so great in its early stages that it would rapidly evaporate and disappear. It has been shown, however (J. J. Thomson, Application of Dynamics to Physics and Chemistry, p. 164; Conductivity through Gases, 2nd ed. p. 179), 'that if a drop of water is charged with electricity the effect of the charge is to diminish the evaporation; if the drop is below a certain size the effect the charge has in promoting condensation more than counterbalances the effect of the surface tension in promoting evaporation. Thus the electric charge protects the drop in the most critical period of its growth. The effect is easily shown experimentally by taking a bulb connected with a piston arranged so as to move with great rapidity. When the piston moves so as to increase the volume of the air contained in the bulb the air is cooled by expansion, and if it was saturated with water vapour before it is supersaturated after the expansion occurs. By altering the throw of the piston the amount of supersaturation can be adjusted within very wide limits. Let it be adjusted so that the expansion produces about a sixfold supersaturation; then if the gas is not exposed to any ionizing agents very few drops (and these probably due to the small amount of ionization which we have seen is always present in gases) are formed. If, however, the bulb is exposed to strong Röntgen rays expansion produces a dense cloud which gradually falls down and disappears. If the gas in the bulb at the time of its exposure to the Röntgen rays is subject to a strong electric field hardly any cloud is formed when the gas is suddenly expanded. The electric field removes the charged ions from the gas as soon as they are formed so that the number of ions present is greatly reduced. This experiment furnishes a very direct proof that the drops of water which form the cloud are only formed round the ions.

This method, therefore, is an exceedingly delicate test for the presence of ions, for there is no difficulty in detecting ten or so raindrops per cubic centimetre; we are thus able to detect the presence of this number of ions. This result illustrates the enormous difference between the delicacy of the methods of detecting ions and those for detecting uncharged molecules; we have seen that we can easily detect ten ions per cubic centimetre, but there is no known method, spectroscopic or chemical, which would enable us to detect a billion \(10^9\) times this number of uncharged molecules. The formation of the water-drops round the charged ions gives us a means of counting the number of ions present in a cubic centimetre of gas; we cool the gas by sudden expansion until the supersaturation produced by the cooling is sufficient to cause a cloud to be formed round the ions, and the problem of finding the number of ions per cubic centimetre of gas is thus reduced to that of finding the number of drops per cubic centimetre in the cloud. Unless the drops are very few and far between we cannot do this by direct counting; we can, however, arrive at the result in the following way. From the amount of expansion of the gas we can calculate the lowering produced in its temperature and hence the total quantity of water precipitated. The water is precipitated as drops, and if all the drops are the same size the number per cubic centimetre will be equal to the volume of water deposited per cubic centimetre, divided by the volume of one of the drops. Hence we can calculate the number of drops if we know their size, and this can be determined by measuring the velocity with which they fall under gravity through the air.

The theory of the fall of a heavy drop of water through a viscous fluid shows that \(v = \frac{g}{6\mu} (\rho - \rho_0)\), where \(\rho\) is the radius of the drop, \(g\) the acceleration due to gravity, and \(\mu\) the coefficient of viscosity of the gas through which the drop falls. Hence if we know \(v\) we can deduce the value of \(a\) and hence the volume of each drop and the number of drops.

Charge on Ion.—By this method we can determine the number of ions in each unit volume of gas. Knowing this number we can proceed to determine the charge on the ion. To do this we apply an electric force so as to send a current of electricity through the gas, taking care that the current is only a small fraction of the saturating current. Then if \(u\) is the sum of the velocities of the positive and negative ions produced in the electric field applied to the gas, the current through unit area of the gas is \(n_u\), where \(n\) is the number of positive or negative ions per cubic centimetre, and \(u\) the charge on an ion. We can easily measure the current through the gas and thus determine \(n\) by the method just described, and \(u\), the velocity of the ions under the given electric field, is known from the experiments of Zeleny and others. Thus since the product \(nu\) and two of the factors \(n\) and \(u\) are known, we can determine the third factor \(v\), the charge on the ion. This method was used by J. J. Thomson, and details of the method will be found in Phil. Mag. [5], 46, p. 528; [6], 48, p. 547; [5], 5, p. 346. The result of these measurements shows that the charge on the ion is the same whether the ionization is by Röntgen rays or by the influence of ultra-violet light on a metal plate. It is the same whatever the gas is, hydrogen, air or carbonic acid, and thus is presumably independent of the nature of the gas. The value of \(e\) formed by this method is \(1.62 \times 10^{-19}\) coulomb.

H. A. Wilson (Phil. Mag. [6], 5, p. 429) used another method. Drops of water, as we have seen, condense more easily on negative than on positive ions. It is possible, therefore, to adjust the expansion so that a cloud of ions is formed on the negative but not on the positive ions. Wilson arranged the experiments so that such a cloud was formed between two horizontal plates which could be maintained at different potentials. The charged drops between the plates were acted upon by a uniform vertical force which affected their rate of fall. Let \(X\) be the vertical electric force, \(e\) the charge on the drop, \(v\) the rate of fall of the drop when this force acts, and \(v\) the rate of fall due to gravity alone. Then since the rate of fall is proportionate to the force on the drop, if \(f = v\) is the radius of the drop, and \(\rho\) its density, then

\[
X = e \frac{f^2 g}{6\rho} v \frac{\rho - \rho_0}{\rho}
\]

or

\[
X = e \frac{f^2 g}{6\rho} v
\]

so that

\[
X = \sqrt{2} \pi g a^2 v \frac{\rho - \rho_0}{\rho}
\]

Thus if \(X, v, \rho\), are known \(e\) can be determined. Wilson by this method found that \(e\) was \(3.1 \times 10^{-18}\) electrostatic units. A few of the ions carried charges \(2e\) or \(3e\). Townsend has used this method of comparing the charge carried by a gaseous ion with that carried by an atom of hydrogen in the electrolysis of solution. We have

\[
e = \frac{dD}{Nf} \frac{1}{2}\]

where \(D\) is the coefficient of diffusion of the ions through the gas, \(N\) the velocity of the ion in the same gas when acted upon by unit electric force, \(f\) the number of molecules in a cubic centimetre of the gas when the pressure is \(H\) dynes per square centimetre, and \(e\) the charge on the ion. This relation is obtained on the hypothesis that \(f\) ions in a cubic centimetre produce the same pressure as \(N\) uncharged molecules.

We know the value of \(N\) from Townsend's experiments and the values of \(e\) from those of Zeleny. We get the following values for \(N = 1 \times 10^{18}\):

Since 1-22 cubic centimetres of hydrogen at the temperature 15° C. and pressure 760 mm. of mercury is liberated by the passage through a cylindrical water of one electromagnetic unit of electricity or 3×10^6 electrostatic units, and in one cubic centimetre of the gas there are 2.46 N atoms of hydrogen, we have, if in the ion charge 3 electrostatic units, on the atom of hydrogen in the electrolysis of solutions

\[ 2.46 N = 3 \times 10^6 \]

or

\[ N E = 1.2 \times 10^6 \]

The mean of the values of Ne in the preceding table is 1.24×10^6. We may conclude that the charge carried by the hydrogen atom in the electrolysis of solutions. The values of Ne for the different gases differ more than we should have expected from the probable accuracy of the measurements of the apparatus and the theory of the ionization of the gases (Proc. Roy. Soc. 80, p. 207) has shown that when the ionization is produced by Röntgen rays some of the positive ions carry a double charge and that this accounts for the values of Ne being greater for the positive than for the negative ions.

The interesting fact, viz. 3×10^6, and after, also Ne = 1.24×10^6, we find N the number of molecules in a cubic centimetre of gas at standard temperature and pressure to be equal to 3×10^6. This method of obtaining N is the only one which does not depend on the shape of the molecules and the forces acting between them.

Another method of determining the charge carried by an ion has been employed by Rutherford (Proc. Roy. Soc. 81, pp. 141, 162), in which the positively electrified particles are measured by the current passing through a known resistance the resistance of which is known.

1. Counting the number of a particles emitted by a given quantity of radium in a known time.

2. Measuring the electric charge emitted by this quantity in the same time.

To count the number of a particles the radium was so arranged that it was near the ionization chamber a small number of a particles per minute; the interval between the emission of individual particles was several seconds. When an a particle passed into the vessel it ionized the gas inside and so greatly increased its conductivity that the gas was kept in an electric field, the current through the gas would suddenly increase when an a particle passed into the vessel. Although each a particle produces about thirty thousand ions, this hardly large enough to produce the necessary change in the conductivities of the gas, but by suitably choosing the electric field and the pressure in the ionization chamber, the 30,000 ions produced by each a particle can be multiplied to such an extent that an appreciable current passes through the ionization chamber in the time of arrival of a single a particle. An electrometer placed in series will show by its deflection when an a particle enters the chamber, and by counting the numbers of deflections per minute we can determine the number of a particles given off in a known time. The method of determining the number is to let the particles fall on a phosphorescent screen, and count the number of scintillations on the screen in a certain time. Rutherford has shown that these two methods give concordant results.

The charge of positive electricity given out by the radium was measured by catching the a particles in a Faraday cylinder placed in a highly exhausted vessel and measuring the charge per minute received by this cylinder. In a later experiment it was found that the charge on the a particle was 9×10^6 electrostatic units.

Now if the a particle is 5×10^6, and there is evidence that the a particle is a charged atom of helium; since the atomic weight of helium is 4 and e/m for hydrogen is 10, it follows that the charge on the helium atom is 4×10^6 on the hydrogen, so that the charge on the hydrogen atom is 4×10^6. This evidence is afforded by the determination of the mass of the atom. We can measure the ratio of the mass of an ion to the charge on the ion by observing the deflections produced by magnetic and electric forces on a moving ion. If an ion carrying a charge is moving with a velocity v, at a point where the magnetic force is H, a mechanical force acts on the ion, whose direction is at right angles both to the direction of motion of the ion and to the magnetic force, and whose magnitude is esH sin θ, where θ is the angle between v and H. Suppose then that we have an ion moving through a gas whose pressure is so low that the free path of the ion is long compared with the distance through which it moves whilst we are experimenting upon it; in this case the motion of the ion will be free, and will not be affected by the presence of the gas.

Since the force is always at right angles to the direction of motion of the ion, the speed of the ion will not be altered by the action of this force; and if the ion is projected with a velocity v in a direction at right angles to the magnetic force, and if the magnetic force is constant in magnitude and direction, the ion will describe a curve in a horizontal plane. The radius of curvature of this curve, m is the mass of the ion, m/εv/μ equals the normal force acting on the ion, i.e. it must be equal to Hε/μ or ε/μ. Therefore the radius of curvature is constant; that the path is the same. The ion is then free, and the path of a positively charged particle in a uniform magnetic field, the lines of magnetic force being horizontal and at right angles to the plane of the paper. The magnetic force makes the rays describe a circle in the plane of the paper, and by measuring the vertical deflection of the phosphoroscope patch at the end of the tube we can determine the radius of this circle, and hence the value of m/εv. From the two observations the value of m/ε and v can be calculated.

Another method of finding m/ε for the negative ion which is a is to catch any of these ions in a magnetic field and measure the time it takes for the ion to pass from one plate to another. This is done in the following way: the following is the only one that is suitable, is as follows: Let us suppose that the ion starts from rest and moves in a field where the electrical and magnetic forces are both uniform, the electric force X being parallel to the axis of x, and the magnetic force Z parallel to the axis of z, then x, y, are the co-ordinates of the ion at the time t, the equations of motion of the ion are

\[ m \frac{dx}{dt} = X - He \]

\[ m \frac{dy}{dt} = He \]

The solution of these equations, if x, y, dx/dt, dy/dt all vanish when t = 0, is

\[ x = \frac{x}{eH} \left( 1 - \cos (\frac{y}{eH}) \right) \]

\[ y = \frac{X}{eH} \left( 1 - \sin (\frac{y}{eH}) \right) \]

These equations show that the path of the ion is a cycloid, the generating circle of which has a diameter equal to 2X/eH, and radius of the cycloid 2X/eH.

Suppose now that we have a number of ions starting from the plane x = 0, and moving towards the plane x = a. The particles starting from x = 0 describe cycloids, and the greatest distance they get from the plane x = 0 is the diameter of the generating circle of the cycloid, i.e. it is 2X/eH. Since the ion is moving in a horizontal plane, the generating circle of the cycloid will be of the form

\[ X \frac{dx}{dt} = He \]

(At time t = 0).

Since the direction of the motion of the generating circle of the cycloid is 2X/eH, the circular arc length of the generating circle is a, and the plane connected with the plane x = 0 is a plane connected with the plane x = a. That
is, the rate at which this plane receives an electric charge will be the same whether there is a magnetic field between the plate or not, but if $a$ is greater than $2 \times 10^{-18}$, then no particle which starts from the plate $x = 0$ will reach the plate $x = a$, and this plate will receive no charge. The supply of electric energy to the plate has been completely stopped by the magnetic field. Thus, on this theory, if the distance between the plates is less than a certain value, the magnetic force should produce no effect on the rate at which the electrometer plate receives a charge, while if the distance is greater than this value, the magnetic force would completely stop the supply of electricity to the plate. The actual phenomena are not so abrupt as this theory indicates. We find that when the plates are very near together the magnetic force produces a very slight effect, and this is an increase in the rate of charge of the electrometer plate. (On increasing the distance to a stage where the magnetic force produces a great diminution in the rate of charging.) It does not, however, stop it abruptly, there being a considerable range of distance, in which the magnetic force diminishes very slowly and does not destroy the current. At still greater distances the current to the plate under the magnetic force is quite inappreciable compared with that when there is no magnetic field. We should get this gradual instead of abrupt decay of the current if some of the particles, instead of all starting from the same point with a finite velocity; in that case the first particles stopped would be those which started from rest. This would be when $a = 2 \times 10^{-18}$.

Thus if we measure the value of $a$ when the magnetic force first begins to affect the leak to the electrometer we determine $2 \times 10^{-18}$, and as we can easily measure $x$ and $H$, we can deduce the value of $m/e$.

By these methods Thomson determined the value of $e/m$ for the negative ions produced when ultra-violet light falls on a metal plate, as well as for the negative ions produced by an incandescent carbon filament in an atmosphere of hydrogen (Phil. Mag. [5], 48, p. 547) as well as for the cathode rays. It was found that the value of $e/m$ for the negative ions was the same in all these cases, and that it was a constant quantity independent of the nature of the gas from which the ions are produced and the means used to produce them. It was found, too, that this value was more than a thousand times the value of $e/M$, where $e$ is the charge carried by an atom of hydrogen in the electrolysis of solutions, and $M$ the mass of an atom of hydrogen. We have seen that this charge is the same as that carried by the negative ion in gases; thus since $e/M$ is more than a thousand times $e/M$, it follows that $M$ must be more than a thousand times $m$. Thus the mass of the negative ion is exceedingly small compared with the mass of the atom of hydrogen, the smallest mass recognized in chemistry.

The production of negative ions thus involves the splitting up of the atom, as from a collection of atoms something is detached whose mass is less than that of a single atom. It is important to notice in connexion with this subject that an entirely different line of argument, based on the Zeeman effect (see Magnet-Optics), leads to the recognition of negatively electrified particles for which $e/m$ is of the same order as that deduced from the consideration of purely electrical phenomena. These small negatively electrified particles are called corpuscles. The latest determinations of $e/m$ for corpuscles available are the following:

**Observer.**

Classen (Ber. deut. phys. Ges. 6, p. 700).

$1.77 \times 10^7$.

$1.75 \times 10^7$.

It follows from electrical theory that when the corpuscles are moving with a velocity comparable with that of light their mass should increase rapidly with their velocity. This effect has been detected by Kauffmann (Gött. Nach., Nov. 8, 1901), who used the corpuscles shot out from radium, some of which move with velocities only a few per cent less than that of light. Other experiments on this point have been made by Bucherer (Ann. der Phys., 28, p. 513).

**Conductivity Produced by Ultra-Violet Light.**—So much use has been made in recent times of ultra-violet light for producing ions that it is desirable to give some account of the electrical effects produced by light. The discovery by Hertz (Wied. Ann., 31, p. 983) in 1887, that the incidence of ultra-violet light on a spark gap facilitates the passage of a spark, led to a series of investigations by Hallwachs, Hörm, Righi and Stoletow, on the effect of ultra-violet light on electrified bodies. These researches have shown that a freshly cleaned metal surface, charged with negative electricity, rapidly loses its charge, however small, when exposed to ultra-violet light, and that if the surface is insulated and without charge initially, it acquires a positive charge under the influence of the light. The magnitude of this positive charge may be very much increased by directing a blast of air on the plate. This, as Zeleny (Phil. Mag. [5], 45, p. 272) showed, has the effect of blowing from the neighbourhood of the plate negatively electrified gas, which has similar properties to the charged gas obtained by the separation of ions from a gas exposed to Röntgen rays or uranium radiation. If the metal plate is positively electrified, there is no loss of electrification caused by ultra-violet light. This has been questioned, but a very careful examination of the question by Elster and Geitel (Wied. Ann., 57, p. 24) has shown that the apparent exceptions are due to the accidental exposure to reflected ultra-violet light of metal surfaces in the neighbourhood of the plate negatively electrified by induction, so that the apparent loss of charge is due to negative electrivity coming up to the plate, and not to positive electrivity going away from it. The ultra-violet light may be obtained from an arc-lamp, the effectiveness of which is increased if one of the terminals is made of zinc or aluminium, the light from these substances being very rich in ultra-violet rays; it may also be got very conveniently by sparking with an induction coil between zinc and cadmium terminals. Negative electrivity is not rich in ultra-violet light, and does not produce anything like so great an effect as the arc light. Elster and Geitel, who have investigated with great success the effects of light on electrified bodies, have shown that the more electro-positive metals lose negative charges when exposed to ordinary light, and do not need the presence of the ultra-violet rays. Thus they found that amalgams of sodium or potassium enclosed in a glass vessel lose a negative charge when exposed to daylight, though the glass stops the small amount of ultra-violet light left in sunlight after its passage through the atmosphere. If sodium or potassium is employed, or, what is more convenient, the mercury-like liquid obtained by mixing sodium and potassium in the proportion of their combining weights, they found that negative electrification was discharged by an ordinary petroleum lamp. If the still more electro-positive metal rubidium is used, the discharge can be produced by the light from a glass rod just heated to redness; but there is no discharge till the glass is luminous. Elster and Geitel arrange the metals in the following order for the facility with which negative electrification is discharged by light: rubidium, potassium, alloy of sodium and potassium, sodium, lithium, magnesium, thallium, zinc. With copper, platinum, lead, iron, cadmium, carbon and mercury the effects with ordinary light are too small to be appreciable. The order is the same as that in Volta's electro-chemical series. With ultra-violet light the different metals show much smaller differences in their power of discharging negative electricity than they do with ordinary light. Elster and Geitel found that the ratio of the photo-electric effects of two metals exposed to approximately monochromatic light depended upon the wave-length of the light, different metals showing a maximum sensitivity in different parts of the spectrum. This is shown by the following table for the alkaline metals. The numbers in the table are the rates of emission of negative electrivity under similar circumstances. The rate of emission under the light from a petroleum lamp was taken as unity:

The table shows that the absorption of light by the metal has a great influence on the photo-electric effect, for while potassium is more sensitive in blue light than sodium, the strong absorption of yellow light by sodium makes it more than five times more sensitive to this light than potassium. Stoletow, at an early period, called attention to the connexion between strong absorption and photo-electric effects. He showed that water, which does not absorb to any great extent either the ultra-violet or visible rays, does not show any photo-electric effect, while strongly coloured solutions, and especially solutions of fluorescent substances such as methyl green or methyl violet, do so to a very considerable extent; indeed, a solution of methyl green is more sensitive than zinc. Hallwachs (Wied. Ann., 37, p. 666) proved...
that in liquids showing photoelectric effects there is always strong absorption; we may, however, have absorption without these effects. Phosphorescent substances, such as calcium sulphide, show this effect, as also do various specimens of fluor-spur. As phosphorescence and fluorescence are probably accompanied by a very intense absorption by the surface layers, the evidence is strong that to get the photo-electric effects we must have strong absorption of some kind of light, either visible or ultra-violet.

If a conductor A is placed near a conductor B exposed to ultra-violet light, and if B is made the negative electrode and a difference of potential established between A and B, a current of electricity will flow between the conductors. The relation between the magnitude of the current and the difference of potential when A and B are parallel plates has been investigated by Stolelov \textit{(Journal de physique, 1890, 11, p. 469)}, von Schweidler \textit{(Wien, Ber., 1890, 108, p. 273)} and Varley \textit{(Phil. Trans. A., 1904, 202, p. 410)}.

The results of some of Varley's experiments are represented in the curves shown in fig. 14, in which the ordinates are the currents and the abscissae the potentials. It will be seen that when the pressure is exceedingly low the current is independent of the potential difference and is equal to the negative charge carried off in unit time by the corpuscles emitted from the surface exposed to the light. At higher pressures the current rises far above these values and increases rapidly with the potential difference. This is due to the corpuscles emitted by the illuminated surface acquiring under the electric field such high velocities that when they strike against the molecules of the gas through which they are passing they ionize them, producing fresh ions which can carry on additional current. The relation between the current and the potential difference in this case is in accordance with the results of the theory of ionization by collision. The corpuscles emitted from a body under the action of ultra-violet light start from the surface with a finite velocity. The velocity is not the same for all the corpuscles, nor indeed could we expect that it should be: for as Ladenburg has shown \textit{(Ann. der Phys., 1903, 12, p. 538)} the seat of their emission is not confined to the surface layer of the illuminated metal but extends to a layer of finite, though small, thickness. Thus the particles which start deep down will have to force their way through a layer of metal before they reach the surface, and in doing so will have their velocities retarded by an amount depending on the thickness of this layer. The variation in the velocity of the corpuscles is shown in the following table, due to Lenard \textit{(Ann. der Phys., 1902, 8, p. 149)}.

If the illuminated surface is completely surrounded by an envelope of the same metal insulated from and completely shielded from the light, the emission of the negative corpuscles from the illuminated surface would go on until the potential difference $V$ between this surface and the envelope became so great that the corpuscles with the greatest velocity lost their energy before reaching the envelope, \textit{i.e.} if $m$ is the mass, $e$ the charge on a corpuscle, $v$ the greatest velocity of projection, until $Ve = \frac{1}{2}mv^2$. The values found for $V$ by different observers are not very consistent. Lenard found that $V$ for aluminium was about 3 volts and for platinum 2. Millikan and Winchester \textit{(Phil. Mag., July 1907)} found for aluminium $V = 738$. The apparatus used by them was so complex that the interpretation of their results is difficult.

An extremely interesting fact discovered by Lenard is that the velocity with which the corpuscles are emitted from the metal is independent of the intensity of the incident light. The quantity of corpuscles increases with the intensity, but the velocity of the individual corpuscles does not. It is worthy of notice that in other cases when negative corpuscles are emitted from metals, as for example when the metals are exposed to cathode rays, Canal-strahlen, or Röntgen rays, the velocity of the emitted corpuscles is independent of the intensity of the primary radiation which excites them. The velocity is not, however, independent of the nature of the primary rays. Thus when light is used to produce the emission of corpuscles the velocity, as Ladenburg has shown, depends on the wave length of the light, increasing as the wave length diminishes. The velocity of corpuscles emitted under the action of cathode rays is greater than that of those ejected by light, while the incidence of Röntgen rays produces the emission of corpuscles moving much more rapidly than those in the cases already mentioned, and the harder the primary rays the greater is the velocity of the corpuscles.

The importance of the fact that the velocity and therefore the energy of the corpuscles emitted from the metal is independent of the intensity of the incident light can hardly be overestimated. It raises the most fundamental questions as to the nature of light and the constitution of the molecules. What is the source of the energy possessed by these corpuscles? Is it the light, or in the stores of internal energy possessed by the molecules? Let us follow the consequences of supposing that the energy comes from the light. Then, since the energy is independent of the intensity of the light, the electric forces which liberate the corpuscles must also be independent of that intensity. But this cannot be the case if, as is usually assumed in the electromagnetic theory, the wave front consists of a uniform distribution of electric force without structure, for in this case the magnitude of the electric force is proportional to the square root of the intensity.

On the emission theory of light a difficulty of this kind would not arise, for on that theory the energy in a luminiferous particle remains constant as the particle pursues its flight through space. Thus any process which a single particle is able to effect by virtue of its energy will be done just as well a thousand miles away from the source of light as at the source itself, though of course in a given space there will not be nearly so many particles to do this process as there are close to the source. Thus, if one of the particles when it struck against a piece of metal could eject a corpuscle, and if the ejection of a corpuscle with a given velocity, the velocity of emission would not depend on the intensity of the light. There does not seem any reason for believing that the electromagnetic theory is inconsistent with the idea that on this theory, as on the emission theory, the energy in the light wave may instead of being uniformly distributed through space be concentrated in bundles which occupy only a small fraction of the volume traversed by the light, and that as the wave travels out the bundles get farther apart, the energy in each remaining undiminished. Some such view of the structure of light seems to be required to account for the fact that when a plate of metal is struck by a wave of ultra-violet light, it would take years before the corpuscles emitted from the metal would equal in number the molecules on the surface of the metal plate, and yet on the ordinary theory of light each one of these is without interruption exposed to the action of

\textbf{FIG. 14.}
CONDUCTION, ELECTRIC

Up to now we have been considering the effects produced when light is incident on metals. Lenard found (and the result has been confirmed by the experiments of J. J. Thomson and Lyman) that certain rays of ultra-violet light ionize a gas when the pass through. The type of ultra-violet light which produces this effect is so easily absorbed that it is stopped by a layer a few millimetres thick of air at atmospheric pressure.

Ionization by Collision.—When the ionization of the gas is produced by external agents such as Röntgen rays or ultra-violet light, the electric field produces a current by setting the positive ions moving in one direction, and the negative ones in the opposite; it makes use of ions already made and does not itself give rise to ionization. In many cases, however, such as in electric sparks, there are no external agents to produce ionization and the electric field has to produce the ions as well as set them in motion. When the ionization is produced by external means the smallest electric field is able to produce a current through the gas; when, however, these external means are absent no current is produced unless the strength of the electric field exceeds a certain critical value, which depends not merely on the nature of the gas but also upon the pressure and the dimensions of the vessel in which it is contained. The variation of the electric field required to produce discharge can be completely explained (we suppose that) ionization of the gas is produced by the impact with its molecules of corpuscles fast enough to make positive ions, which under the influence of the electric field have acquired considerable kinetic energy. We have direct evidence that rapidly moving corpuscles are able to ionize molecules against which they strike, for the cathode rays consist of such corpuscles, and these when they pass through a gas produce large amounts of ionization. Suppose then that we have in a gas exposed to an electric field a few corpuscles. These will be set in motion by the field and will acquire an amount of energy in proportion to the product of the electric force, their charge, and the distance travelled in the direction of the electric field between two collisions with the molecules of the gas. If this energy is sufficient to give them the ionizing property possessed by cathode rays, then when a corpuscle strikes against a molecule it will detach another corpuscle; this under the action of the electric field will acquire enough energy to produce corpuscles on its own account, and so as the corpuscles move through the gas their number will increase in geometrical progression. Thus, though there were but few corpuscles to begin with, there may be great ionization after these have been driven some distance through the gas by the electric field.

The number of ions produced by collisions can be calculated by the following method. Let the electric force be parallel to the axis of the x, and let n be the number of corpuscles per unit volume at a place fixed by the co-ordinate x; then in unit time these corpuscles will make $n\nu x$ collisions with the molecules, if $\nu$ is the velocity of a corpuscle in the free path of a corpuscle. When the corpuscles are moving fast enough to produce ions by collision their velocities are very much greater than those they would possess at the same temperature if they were not acted on by electrical force, and so we may regard the velocities as being parallel to the axis of x and be set in motion purely by the action of the electric field of the corpuscles. We have to consider how many of the $n\nu x$ collisions which take place per second will produce ions. We should expect that the ionization of a molecule would require a certain amount of energy, so that the amount of energy which the ions acquire must be enough to make a certain number of collisions. We should expect that the amount of energy possessed by the corpuscle when it collides against the molecules would be $\epsilon x\lambda$ in the electric force, $e$ the charge on the corpuscle, and $\lambda$ the mean free path. If the fraction of collisions is $\epsilon x\lambda$, then the number of ions produced per cubic centimetre per second is

$$f(x)\nu x\lambda.$$
We shall, however, to begin with, assume that the current is so small that this cumulative effect may be neglected.

Let us now consider the rate of increase, \( \frac{dn}{dt} \), in the number of corpuscles per unit volume. In consequence of the collisions, \( f(X)e/nu/ = \frac{dn}{dt} \)/second; in consequence of the motion of the corpuscles, the number which leave unit volume per second is greater than those which enter it by \( \frac{d}{ds}ms \); while in a certain number of collisions a corpuscle will stick to the molecule and will thus cease to be a free corpuscle. Let the fraction of the number of corpuscles in which this occurs be \( \beta \). Thus the gain in the number of corpuscles is \( f(X)e/nu/ \), while the loss is \( \frac{d}{ds}ms \); hence

\[
\frac{dn}{dt} = f(X)e/nu/ \frac{d}{ds}ms - \beta nu.
\]

When things are in a steady state \( \frac{dn}{dt} = 0 \), and we have

\[
\frac{d}{ds}ms = \frac{1}{f(X)e/nu/ - \beta nu}.
\]

If the current is so small that the electrical charges in the gas are not able to produce any appreciable variations in the field, \( X \) will be constant and we get \( nu = Ce/nu/ - \beta nu \). If we take the place from which we viewed \( X \) at the cathode, \( C \) is the value of \( nu \) at the cathode, i.e., it is the number of corpuscles emitted per unit area of the cathode per unit time; this is equal to \( e/nu/ \) if \( e/nu/ \) is the quantity of negative electricity coming from unit area of the cathode per second, and \( e/nu/ \) the electric charge carried by a corpuscle.

Hence we have \( nu = e/nu/ + e/nu/ \). If \( X \) is the distance between the anode and the cathode, the value of \( nu \), when \( x = x \), is the current passing through unit area of the gas, if we neglect the electricity carried by negatively electrified carriers other than corpuscles. Hence \( i = e/nu/ \).

Thus the distance between the plates increases in geometrical progression with the distance between the plates.

By measuring the variation of the current as the distance between the plates is increased, Townsend, to whom we owe much of our knowledge on this subject, determined the values of \( e/nu/ \) for different values of \( X \) and for different pressures for air, hydrogen and carbonic acid gas (Phil. Mag. [6], 1, p. 198). Since \( \beta \) varies inversely as the pressure, it follows that \( e/nu/ \) may be written in the form \( \rho(x/p) \), the following are some of the values of \( \rho \) found by Townsend for air.

We see from this table that for a given value of \( X \), \( e/nu/ \) for small pressures increases as the pressure increases; it attains a maximum at a particular pressure, and then diminishes as the pressure increases. The increase in the pressure increases the number of corpuscles, but diminishes, the energy acquired by the corpuscles in the electric field, and thus diminishes the change of any one collision resulting in ionization. If we suppose the field is so strong that at some particular pressure the energy acquired by the corpuscle is well above the value \( e/nu/ \) required for ionization, then it is evident that the increasing the number of collisions will increase the amount of ionization, and therefore \( e/nu/ \) and \( e/nu/ \) cannot begin to diminish until the pressure has increased to such an extent that the mean free path of a corpuscle is so small that the energy acquired by the corpuscle from the electric field falls below the value when each collision results in ionization.

The value of \( \beta \), when \( X \) is given, for which \( e/nu/ \) is a maximum, is proportional to \( X \); this follows at once from the fact that \( e/nu/ \) is of the form \( e/nu/ \). If \( e/nu/ \) is the maximum value of \( f(X)p \) is a function of \( x \) and \( p \), and the maximum value is seen from the preceding table to be about 420, when \( X \) is expressed in volts per centimeter and \( p \) in millimetres of mercury. The maximum value of \( f(X)p \) is about 1/660. Since the current passing between two planes at a distance \( l \) apart is \( ie/nu/ \) or \( ie/nu/ f(X)p \), and since the force between the planes is supposed to be uniform, \( Xl \) is equal to \( V \), the potential between the plates; hence the current between the plates is \( ie/nu/ f(X)p \), and the greatest value it can have is \( ie/nu/ f(X)p \). Thus the ratio between the current between the plates when there is ionization and when there is none cannot be greater than \( ie/nu/ f(X)p \), if \( V \) is measured in volts. This result is based on Townsend's experiments with very weak currents; we must remember, however, that when the collisions are so frequent that the effects of collisions can accumulate, \( a \) may have much larger values than when the current is small. In some experiments made by J. J. Thomson with intense currents from cathodes covered with hot lime, the increase in the current when the potential difference was 60 volts, instead of being \( e/nu/ \) times the current when there was no ionization, as the precision of the indications, was several hundred times that value, thus indicating a great increase in \( a \) with the strength of the current.

Townsend has shown that we can deduce from the values of \( a \) the mean free path of a corpuscle. For if the ionization is due to the collisions with the corpuscles, then unless one collision detaches more than one corpuscle the maximum number of corpuscles produced will be equal to the number of collisions. When each collision results in the production of a corpuscle, the mean free path of the electron is independent of the strength of the electric field. Hence we see that the value of \( a \), when it is independent of the electric field, is equal to the reciprocal of the mean free path. Thus from the table we infer that at a pressure of 1 atmosphere the mean free path in 630 cm.; hence at 1 atm. the mean free path of a corpuscle is 1/19 cm. Townsend has shown that this value of the mean free path agrees well with the value 1/21 cm. deduced from the kinetic theory of gases for a corpuscle moving through air. By measuring the values of \( a \) for hydrogen and carbonic acid gas Townsend and Kirby (Phil. Mag. [6], 1, p. 630) showed that the mean free paths for corpuscles in these gases are respectively 1/11.5 and 1/29 cm. at a pressure of 1 mm. These results again agree well with the values given by the kinetic theory of gases.

Since \( e/nu/ = 1/660 \), when \( l \) is the distance between the plates, we see that

\[
\frac{nu}{mc} = e/nu/ (e/nu/ - e/nu/),
\]

since \( e/nu/ \) is a very small quantity we see that \( nu \) will be less than \( m \) except when \( e/nu/ \) is small, i.e., except close to the anode. Thus there will be an excess of positive electricity from the cathode almost to the anode, while in the anode there will be an excess of negative. This distribution of electricity will make the electric force diminish from the cathode to the place where there is as much positive as negative electricity, where it will have its minimum value and then increase again.

The expression \( i = e/nu/ \) applies to the case when there is no source of ionization in the gas other than the collisions; if in addition to this there is a source of uniform ionization producing \( g \) ions per cubic centimetre, we can easily show that

\[
i = e/nu/ \frac{g}{mc} (e/nu/ + e/nu/ - 1).
\]

With regard to the minimum energy which must be possessed by a corpuscle to enable it to produce ions by collision, Townsend (loc. cit.) came to the conclusion that to ionize air the corpuscle must possess an amount of energy equal to that acquired by the fall of its charge through a potential difference of about 2 volts. This is also the value arrived at by H. A. Wilson by entirely different considerations. Stark, however, gives 17 volts as the minimum for ionization. The energy depends upon the nature of the gas; recent experiments by Dawes and Gill and Pedder (Aug., 1909) have shown that it is smaller for helium than for air, hydrogen, or carbonic acid gas.

If there is no external source of ionization and no emission of corpuscles from the cathode, then it is evident that even if some corpuscles happened to be present in the gas when the electric field were applied, we could not get a permanent current by the aid of collisions made by these corpuscles. For under the electric field, the corpuscles would be driven from the cathode to the anode, and in a short time all the corpuscles originally present in the gas and those produced by them would be driven from the gas against the anode, and if there was no source from which fresh corpuscles could be introduced into the gas the current would cease. The current, however, could be maintained indefinitely if the positive ions in their journey back to the cathode also produced ions by collisions, for then we should have a kind of regenerative process by which the supply of corpuscles could be continually renewed. To maintain the current it is not necessary that the ionization resulting from the positive ions should be anything like as great as that from the negative, as the investigations given below show; a very small amount of ionization by the positive ions will suffice to maintain the current. The existence of ionization by collision with positive ions has been proved by Townsend. Another method by which the current could be and is maintained is by the anode emitting corpuscles under the impact of the positive ions driven against it by the electric field.

J. J. Thomson has shown by direct experiment that positively
CONDUCTION, ELECTRIC

elcctrihed particles when they strike against a metal plate cause the metal to emit corpuscles (J. J. Thomson, Proc. Camb. Phil. Soc., 13, 13, 1915; London). If we assume that the number of corpuscles emitted by the plate in one second is proportional to the energy in the positive ions which strike the plate in that second, we can readily find an expression for the difference of potential which will maintain without any external ionization a current of electricity through the gas. As this investigation brings into prominence many of the most important features of the electric discharge, we shall consider it in some detail.

Let us suppose that the electrodes are parallel plates of metal at right angles to the axis of $x$, and that at the cathode $x = a$ and at the anode $x = d$, being thus the distance between the plates. Let us also suppose that the current of electricity flowing between the plates is so small that the electrification between the plates due to the accumulation of ions is not sufficient to disturb appreciably the electric field, which we regard as uniform between the plates, the electric force being equal to $V/d$, where $V$ is the potential difference between the plates. The number of positive ions produced per second in a layer of gas between the planes $x$ and $x + dx$ is $n^e dx$. Here $n$ is the number of corpuscles per unit volume, $\alpha$ the coefficient of ionization (for strong electric field $\alpha = 1/n^0$, where $n^0$ is the mean free path of a corpuscle), and $\nu$ the velocity of a corpuscle parallel to $x$. We shall see that we may put $\alpha^0 = \nu = \nu^0$, since $\nu$ is the number of corpuscles emitted per second by unit area of the cathode. Thus the number of positive ions produced in the layer is $n^e \alpha x^2 dx$. If these went straight to the cathode without a collision, each of them would have received an amount of kinetic energy $V x^2$ when they reached the cathode, and the energy of the group of ions would be $V x^2 \alpha x^2 dx$. The positive ions will, however, collide with the molecules of the gas through which they are passing, and this will diminish the energy they possess when they reach the cathode.

The diminution in the energy will increase in geometrical proportion with the length of path travelled by the ion and will thus be proportional to $e^{\beta x}$. $\beta$ will be proportional to the number of collisions and will thus be proportional to the pressure of the gas. Thus the kinetic energy possessed by the ions when they reach the cathode will be

$$e^{\beta x} V(x, \alpha x^2 dx),$$

and $E$, the total amount of energy in the positive ions which reach the cathode in unit time, will be given by the equation

$$E = \int_0^d e^{\beta x} V(x, \alpha x^2 dx).$$

If the number of corpuscles emitted by the cathode in unit time is proportional to this energy, we have $i = kE$, where $k$ is a constant; hence by equation (1) we have

$$V = \frac{\beta - \alpha}{k} \frac{d}{dx}$$

where

$$I = e^{\beta x} (d + d/\beta x).$$

Since both $\beta$ and $\alpha$ are proportional to the pressure, $I$ and $(\beta - \alpha)/k$ are both functions of $pd$, the product of the pressure and the spark length, hence we see that $V$ is expressed by an equation of the form

$$V = \frac{k}{e^r} f(pd)$$

where $f(pd)$ denotes a function of $pd$, and neither $p$ nor $d$ enter into the expression in any other way. Thus the potential difference required to produce discharge is constant as long as the product of the pressure and spark length remains constant; in other words, the spark potential is constant as long as the mass of the gas between the electrodes is constant. Thus, for example, if we halve the pressure the same potential difference will produce a spark of twice the length. This law, which was discovered by Paschen for fairly long sparks (Annalen, 37, p. 79), and has been shown by Carr and Philipp (1885) to hold for all important pressures of the electric discharge, we see from the expression for $V$ that when $(\beta - \alpha)/k$ is very large $V$ becomes infinite when $d$ is infinite. Again when $(\beta - \alpha)/k$ is very small we find

$$V = \frac{1}{\beta x}$$

Thus $V$ becomes infinite when $d$ is infinite. Again when $(\beta - \alpha)/k$ is very small we find

$$V = \frac{1}{\beta x}$$

Thus $V$ becomes infinite when $d$ is infinite. Again when $(\beta - \alpha)/k$ is very small we find
CONDUCTION, ELECTRIC

The discharge though the rest of the field were comparatively weak. Such a distribution of electric force requires, however, a great accumulation of charged ions near the cathode; until these ions accumulate the field will be uniform. If the uniform field existing in the gas before the discharge begins were strong enough to make the corpuscles produce ions by collision, but not strong enough to make the positive ions act as ionizers, there would be some accumulation of ions, and the amount of this accumulation would depend upon the number of free corpuscles originally present in the gas, and upon the strength of the electric field. If the accumulation were sufficient to make the field near the cathode so strong that the positive ions could produce fresh ions either by collision with the cathode or with the gas, the discharge would pass through the gas; if not, there will be no continuous discharge. As the amount of the accumulation depends on the number of corpuscles present in the gas, we can understand how it is that after a spark has passed, leaving for a time a supply of corpuscles behind it, it is easier to get a discharge to pass through the gas than it was before.

The inequality of the electric field in the gas when a continuous discharge is passing through it is very obvious when the pressure of the gas is low. In this case the discharge presents a highly differentiated appearance of which a type is represented in fig. 15. Starting from the cathode we have a thin velvety luminous glow in contact with the surface; this glow is often called the “first cathode layer.” Next this we have a comparatively dark space whose thickness increase as the pressure diminishes; this is called the “Crookes’s dark space,” or the “second cathode layer.” Next this we have a luminous position called the “negative glow” or the “third cathode layer.” The boundary between the second and third layers is often very sharply defined. Next to the third layer we have another dark space called the “Faraday dark space.” Next to this and reaching up to the anode is another region of luminosity, called the “positive column,” sometimes (as in fig. 15, a) continuous, sometimes (as in fig. 15, b) broken up into light or dark patches called “striaions.” The dimensions of the Faraday dark space and the positive column vary with the current passing through the gas and with its pressure; sometimes one or other of them is absent. These differences in appearances are accompanied by great difference in the strength of the electric field. The magnitude of the electric force at different parts of the discharge is represented in fig. 16, where the ordinates represent the electric force at different parts of the tube, the cathode being on the right. We see that the electric force is very large indeed between the negative glow and the cathode, much larger than in any other part of the tube. It is not constant in this region, but increases as we approach the cathode. The force reaches a maximum either in the negative glow itself or in the part of the Faraday dark space just outside, after which it increases towards the positive column. In the case of a uniform positive column the electric force along it is constant until we get quite close to the anode, when a sudden change, called the “anode fall,” takes place in the potential.

The difference of potential between the cathode and the negative glow is called the “cathode potential fall” and is found to be constant for wide variations in the pressure of the gas and the current passing through. It increases, however, considerably when the current through the gas exceeds a certain critical value, depending on the size of the cathode. This cathode fall of potential is shown by experiment to be very approximately equal to the minimum potential difference. The following table contains a comparison of the cathode falls of potentials in various gases made by Warburg (Wied. Ann., 1887, 31, p. 545, and 1890, 40, p. 1), Capstick (Proc. Roy. Society, 1898 63, p. 356), and Strutt (Phil. Trans., 1900, 193, p. 377), and the measurements by Strutt of the smallest difference of potential which will maintain a spark through these gases.

Thus in the cases in which the measurements could be made with the greatest accuracy the agreement between the cathode fall and the minimum potential difference is very close. The cathode fall depends on the material of which the terminals are made, as is shown by the following table due to Mey (Verh. deutsch. physik. Gesell., 1903, 5, p. 72).

</table>

The dependence of the minimum potential required to produce a spark upon the metal of which the cathode is made has not been clearly established, some observers being unable to detect any difference between the potential required to spark between electrodes of aluminium and those of brass, while others thought they had detected such a difference. It is only with sparks not much longer than the critical spark length that we could hope to detect this difference. When the current through the gas exceeds a certain critical value depending on other things on the size of the cathode, the cathode fall of potential increases rapidly and at the same time the thickness of the dark
spaces diminishes. We may regard the part of the discharge between the cathode and the negative glow as a discharge taking place under minimum potential difference through a distance equal to the critical spark length. An inspection of fig. 16 will show that we cannot regard the electric field as constant even for this small distance; it thus becomes a matter of interest to know what would be the effect on the minimum potential difference required to produce a spark if there were sufficient ions present to produce variations in the electric field analogous to those represented in fig. 16. If the electric force at a distance \( x \) from the cathode were proportional to \( e^{-x} \) we should have a state of things much resembling the distribution of electric force near the cathode. If we apply to this distribution the methods used above for the case when the force was uniform, we shall find that the minimum potential is less and the critical spark length greater than when the electric force is uniform.

**Potential Difference required to produce a Spark of given Length.**

We may regard the region between the cathode and the negative glow as a place for the production of corpuscles, these corpuscles finding their way from this region through the negative glow. The parts of this glow towards the anode we may regard as a cathode, from which, as from a hot lamp cathode, corpuscles are emitted, and then accelerated by the electric force, and these corpuscles shoot out from the negative glow with a velocity depending on the cathode fall of potential and independent of the pressure. These corpuscles will collide with the molecules of the gas, and unless there is an external electric field to maintain their velocity they will soon come to rest and accumulate in front of the negative glow. The electric force exerted by this cloud of corpuscles will diminish the strength of the electric field in the region between the cathode and the negative glow, and thus tend to stop the discharge. To keep up the discharge we must have a sufficiently strong electric field between the negative glow and the anode to remove the corpuscles from this region as fast as they are sent into it from the cathode. If, however, there is no production of ions in the region between the negative glow and the anode, all the ions in this region will have come from near the cathode and will be negatively charged; this negative electrification will diminish the electric force on the cathode side of it and thus tend to stop the discharge. This back electric field could, however, be prevented by a little ionization in the region between the cathode and anode by a negative particle or a negative ion, and thus afford an opportunity for the gas in this region to have in it as many positive as negative ions; in this case it would not give rise to any back electro-motive force. The ionization which produces these positive ions may, if the field is intense, be due to the collisions of corpuscles, or it may be due to radiation analogous to ultra-violet, or soft Röntgen rays, which have been shown by experiment to accompany the discharge. Thus in the most simple conditions for discharge we should have sufficient ionization to keep up the supply of positive ions, and an electric field strong enough to keep the velocity of the negative corpuscle equal to the value it has when it emerges from the negative glow. Thus the force must be such as to give a constant velocity to the corpuscle, and since the force required to move an ion with a given velocity is proportional to the pressure, this force will be proportional to the pressure of the gas. Let us call this force \( ap \); then if \( l \) is the distance of the anode from the negative glow the potential difference between these points will be \( alp \). The potential difference between the negative glow and the cathode is constant and may be expressed in terms of some constant \( V \), so that the potential difference between the anode and cathode, then \( V = e + alp \), a relation which expresses the connexion between the potential difference and spark length for spark lengths greater than the critical distance.

It is to be remembered that the result we have obtained applies only to such a case as that indicated above, where the electric force is constant along the positive column. Experiments with the discharge through gases at low pressure show the discharge may take other forms. Thus the positive column may be striated when the force along it is no longer uniform, or the positive column may be absent; the discharge may be changed from one of these forms to another by altering the current. The relation between the potential and the distance between the electrodes varies greatly, as we might expect, with the current passing through the gas.

The connexion between the potential difference and the spark length has been made the subject of a large number of experiments. The first measurements were made by Lord Kelvin in 1860 (Collected Papers on Electrostatics and Magnetism, p. 247); subsequent experiments have been made by Baille (Ann. de chimie et de physique, 5, 25, p. 486), Liebig (Phil. Mag. [5], 24, p. 106), Paschen (Wied. Ann. 37, p. 79), Peace (Proc. Roy. Soc., 1802, 52, p. 90), Orgler (Ann. der Phys. 1, 155), Strutt (Phil. Trans. 193, p. 377), Boute (Comptes rendus, 131, pp. 469, 503), Earhart (Phil. Mag. [6], 1, p. 147), Carr (Phil. Trans., 1903), Russell (Phil. Mag. [5], 64, p. 237), Hobbs (Phil. Mag. [6], 10, p. 617), Kinsky (Phil. Mag. [6], 9, 602), Ritter (Ann. der Phys. 14, p. 118). The results of their experiments show that for sparks considerably longer than the critical spark length, the relation between the potential difference \( V \) and the spark length \( l \) may be expressed when the electrodes are large with great accuracy by the linear relation \( V = e + b l \), where \( e \) is the pressure and \( b \) and \( b \) are constants depending on the nature of the gas. When \( l \) is small compared with the wave length of the sparking potential is proportional to the spark length. Though there are considerable discrepancies between the results obtained by different observers, these indicate that the production of a long spark between large electrodes in air at atmospheric pressure requires a potential difference of 30,000 volts for each centimetre of spark length. In hydrogen only about half this potential difference is required, in carbonic acid gas the potential difference is about the same as in air, while Ritter's experiments show that in helium only about one-tenth of this potential difference is required.

In the case when the electric field is not uniform, as for example when the discharge takes place between spherical electrodes, Russell's experiments show that the discharge takes place as soon as the maximum electric force in the field between the electrodes reaches a definite value, which he found was for air at atmospheric pressure about 38,000 volts per centimetre.

**Very Short Sparks.** — Some very interesting experiments on the potential difference required to produce exceedingly short sparks have been made by Earhart and Kinsky; the length of these sparks was comparable with the wave length of sodium light. With sparks of these lengths it was found that it was possible to get a discharge with less than 330 volts, the minimum potential difference in air. The results of these observers show that there is no diminution in the minimum potential difference required to produce discharge until the spark length gets so small that the average electric force between the electrodes amounts to about one million volts per centimetre. When the force rises to this value a discharge takes place even though the potential difference is much less than 330 volts; in some of Earhart's experiments it was only about 2 volts. This kind of discharge is determined not by the condition that the potential difference should have a given value, but that the electric force should have a given value. Another point in which this discharge differs from the ordinary one is that it is influenced entirely by the nature of the electrodes and not by the nature or pressure of the gas between them, whereas the ordinary discharge is in many cases not affected appreciably by changes in the metal of the electrodes, but is always affected by changes in the pressure and character of the gas between the electrodes. When one of these small sparks passed between the electrodes a kind of metallic bridge was formed between them, so that they were in metallic connexion, and that the distance between them had to be considerably increased before the bridge was broken. Almy (Phil. Mag., Sept. 1908), who used very small electrodes, was unable to get a discharge with less than the minimum spark potential even when the spark length was reduced to one-third of the wave length of sodium light. He suggests that the discharges obtained with larger electrodes for smaller voltages are
due to the electrodes being dragged together by the electrostatic attraction between them.

Conduction, Electric Spark.—Schuster and Hemsalech (Phil. Trans. 193, p. 180), Hemsalech (Comptes Rendus, 156, p. 898; 152, p. 917; Jour. de Phys. 5, 9, p. 43, and Schenck, Astroph. Jour. 14, p. 116) have by spectroscopic methods obtained very interesting results about the constitution of the spark. The method employed by Schuster and Hemsalech was as follows: Suppose we photograph the spectrum of a horizontal spark on a film which is on the rim of a wheel rotating about a horizontal axis with very great velocity. If the luminosity travelled with infinite speed from one electrode to the other, the image on the film would be a horizontal line. If, however, the speed with which the luminosity travelled between the electrodes was comparable with the speed of the film, the line would be inclined to the horizontal, and by measuring the inclinations we could find the speed at which the luminosity travelled. In this way Schuster and Hemsalech showed that when an oscillating discharge passed between metallic terminals in air, the first spark passed through the air alone, no lines of the metal appearing in its spectrum. This first spark vaporizes some of the metal and the subsequent sparks passing mainly through the metallic vapour; the appearance of the lines in the film shows that the velocity of the luminous part of the vapour was finite. The velocity of the vapour of metals of low atomic weight was in general greater than that of the vapour of heavier metals. Thus the velocity of aluminium vapour was 1890 metres per second, that of zinc and cadmium only about 545. Perhaps the most interesting point in the investigation was the discovery that the velocities corresponding to different lines in the spectrum of the same metal were in some cases different. Thus with bismuth some of the lines indicated a velocity of 1420 metres per second, others a velocity of only 550, while one (λ = 5793) showed a still smaller velocity. These results are in accordance with a view suggested by other phenomena that many of the lines in a spectrum produced by an electrical discharge originate from systems formed during the discharge and not from the neutral atom or molecule. Schenck and Hemsalech found that by inserting a coil with large self induction in the primary circuit they could obliter the air lines in the discharge.

Schenck, by observing the appearance presented when an alternating current, produced by discharging Leyden jars, was examined in a rapidly rotating mirror, found it showed the following stages: (1) a thin bright line, followed in some cases at intervals of half the period of the discharge by fainter lines; (2) bright curved streamers starting from the negative terminal, and diminishing rapidly in speed as they receded from the cathode; (3) a diffused glowing lasting for a much longer period than either of the preceding. These constituents gave out quite different spectra.

The structure of the discharge is much more easily studied when the pressure of the gas is low, as the various parts which make up the discharge are more widely separated from each other. We have already described the general appearance of the discharge through gases at low pressures (see p. 637). There is, however, one form of discharge which is so striking and beautiful that it deserves more detailed consideration. In this type of discharge, known as the striated discharge, the positive column is made up of alternate bright and dark patches known as striations. Some of these are represented in fig. 17, which is taken from a paper by De la Rue and Müller (Phil. Trans., 188, Pt. 1). This type of discharge only occurs when the current and the pressure of the gas are between certain limits. It is most beautifully shown when a Wehnelt cathode is used and the current is produced by storage cells, as this allows us to use large currents and to maintain a steady potential difference between the electrodes. The striations are in consequence very bright and steady. The facts which have been established about these striations are as follows: The distance between the bright parts of the striations is greater at low pressures than at high; it depends also upon the diameter of the tube, increasing as the diameter of the tube increases. If the discharge tube is wide at

one place and narrow in another the striations will be closer together in the narrow parts than in the wide. The distance between the striations depends on the current through the tube. The relation is not a very simple one, as an increase of current sometimes increases while under other circumstances it decreases the distance between the striations (see Willows, Proc. Camb. Phil. Soc. 10, p. 302). The electric force is not uniform along the striated discharge, but is greater in the bright than in the dark parts of the striation. An example is shown in fig. 16, due to H. A. Wilson, which shows the distribution of electric force at every place in a striated discharge. In experiments made by J. J. Thomson (Phil. Mag., Oct. 1909), using a Wehnelt cathode, the variations in the electric force were more pronounced than those shown in fig. 16. The electric force in this case changed so greatly that it actually became negative just on the cathode side of the bright part of the striation. Just inside the striation on the anode side it rose to a very high value, then continually diminished towards the bright side of the next striation when it again increased. This distribution of electric force implies that there is great excess of negative electricity at the bright head of the striation, and a small excess of positive everywhere else. The temperature of the gas is higher in the bright than in the dark parts of the striations. Wood (Wied. Ann. 49, p. 238), who has made a very careful study of the distribution of temperature in a discharge tube, finds that in those tubes the temperature varies in the same way as the electric force, but that this temperature (which must be remembered is the average temperature of all the molecules and not merely of those which are taking part in the discharge) is by no means high; in no part of the discharge did the temperature in his experiments exceed 100° C.

Theory of the Striations.—We may regard the heaping up of the negative charges at intervals along the discharge as the fundamental feature in the striations, and this heaping up may be explained as follows. Imagine a corpuscle projected with considerable velocity from a place where the electric field is strong, such as the neighbourhood of the cathode; as it moves towards the anode through the gas it will collide with the molecules, ionize them and lose energy and velocity. Thus unless the corpuscle is acted on by a field strong enough to supply it with the energy it loses by collision, its speed will gradually diminish. Further, when its energy falls below a certain value it will unite with a molecule and become part of a negative ion, instead of a corpuscle; at this stage there will be a sudden
very large diminution in its velocity. Let us now follow the course of a stream of corpuscles starting from the cathode and approaching the anode. If the speed falls off as the stream proceeds, the corpuscles in the rear will gain on those in front and the density of the stream in the front will be increased. If at a certain place the velocity receives a sudden check by the corpuscles becoming loaded with a molecule, the density of the negative electricity will increase at this place with great rapidity, and here there will be a great accumulation of negative electricity, as at the bright head on the cathode side of a striation. Now this accumulation of negative electricity will produce a large electric force on the anode side; this will drive corpuscles forward with great velocity and ionize the gas. These corpuscles will behave like those shot from the cathode and will accumulate again at some distance from their origin, forming the bright head of the next striation, when the process will be repeated. On this view the bright heads of the striations act like electrodes, and the discharge passes from one bright head to the next as by a number of luminous steps, each directly from cathode to anode. The luminosity at the head of the striations is due to the recombinations of the ions. These ions have acquired considerable energy from the electric field, and this energy will be available for supplying the energy radiated away as light. The recombinations of ions which do not possess considerable amounts of energy do not seem to give rise to luminosity. Thus, in an ionized gas not exposed to an electric field, although we have recombinations between the ions, we need not have luminosity. We have at present no exact data as to the amount of energy which must be given to an ion to make it luminous on recombinations; it also certainly varies with the nature of the ion; thus even with hot Wehnnelt cathodes J. J. Thomson has never been able to make the discharge through air luminous with a potential less than from 16 to 17 volts. The mercury lamps, however, in which the discharge passes through mercury vapor, with potential differences of about 12 to 15 volts. It follows that if the preceding theory be right the potential difference between two bright striations must be great enough to make the corpuscles ionize by collision and also to give enough energy to the ions to make them luminous when they recombine. The difference of potential between the bright parts of successive striations has been measured by Hohn (Phys. Zeit. 9, p. 558); it varies with the pressure and with the gas. The smallest value given by Hohn is about 15 volts. In some experiments made by J. J. Thomson, when the pressure of the gas was very low, the difference of potential between two adjacent dark spaces was as low as 3.75 volts.

The Arc Discharge.—The discharges we have hitherto considered have been characterized by large potential differences and small currents. In the arc discharge we get very large currents with comparatively small potential differences. We may get the arc discharge by taking a battery of cells large enough to give a potential difference of 60 to 80 volts, and connecting the cells with two carbon terminals, which are put in contact, so that a current of electricity flows round the circuit. If the terminals, while the current is on, are drawn apart, a bright discharge, which may carry a current of many amperes, passes from one to the other. This arc discharge, as it is called, is characterized by intense heat and by the brilliant luminosity of the terminals. This makes it a powerful source of light. The temperature of the positive terminal is much higher than that of the negative. According to Violle (Comptes Rendus, 115, p. 1273) the temperature of the tip of the former is about $3300^\circ$ C, and that of the latter $2700^\circ$ C. The temperature of the arc itself is found to be higher than that of either of its terminals. As the arc passes, the positive terminal gets hollowed out into a crater-like shape, but the negative terminal remains pointed. Both terminals lose weight.

The appearance of the terminals is shown in fig. 18, given by Mrs. Ayton (Proc. Insti. Elect. Eng. 28, p. 400); a, b represent the terminals when the arc is quiet, and c when it is accompanied by a hissing sound. The intrinsic brightness of the positive crater does not increase with an increase in the current; an increased current produces an increase in the area of the luminous crater, but the amount of light given out by each unit of area of luminous surface is unaltered. This indicates that the temperature of the crater is constant; it is probably that at which carbon volatilizes. W. E. Wilson (Proc. Roy. Soc. 59, p. 174; 60, p. 377) has shown that at pressures of several atmospheres the intrinsic brightness of the crater is considerably diminished.

![Fig. 18](image)

The connexion between $V$, the potential difference between the terminals, and $i$, the length of the arc, is somewhat analogous to that which holds for the spark discharge. Fröhlich (Electrotech. Zeit. 4, p. 190) gives for this connexion the relation $V = m + ni$, where $m$ and $n$ are constants. Mrs. Ayton (The Electric Arc, chap. iv.) finds that both $m$ and $n$ depend upon the current passing between the terminals, and gives as the relation between $V$ and $i$, $V = a + (\gamma + \delta) i$, where $a, \gamma, \delta$ are constants and $i$ the current.

The relation between current and potential difference was made the subject of a series of experiments by Ayton (Electrician, 1, p. 319; xi, p. 418), some of whose results are represented in fig. 19. For a quiet arc an increase in current is accompanied by a fall in potential difference, while for the hissing arc the potential difference is independent of the current. The quantities $m$ and $n$ which occur in Fröhlich's equation have been determined by several experimenters. For carbon electrodes in air at atmospheric pressure $m$ is about 39 volts, varying somewhat with the size and purity of the carbons; it is diminished by soaking the terminals in salt solution. The value of $n$ given by different observers varies considerably, ranging from $-70$ to 2 volts when $i$ is measured in milliamperes; it depends upon the current, diminishing as the current increases. When metallic terminals are used instead of carbons, the value of $m$ depends upon the nature of the metal, $m$ in general being larger the higher the temperature at which the metal volatilizes. Thus $v$. Lang (Wied. Ann. 31, p. 381) found the following values for $m$ in air at atmospheric pressure: $C = 35; Pt = 27.4; Fe = 25; Ni = 26.8; Cu = 23.86; Ag = 15.23; Zn = 19.86; Cd = 10.28$. Lecher (Wied. Ann. 33, p. 690) gives $Pt = 28; Fe = 20; Ag = 8$, while Arons (Wied. Ann. 31, p. 384) found for Hg the value 12.8; in this case the fall of potential along the arc itself was abnormally small. In comparing these values it is important to remember that Lecher (loc. cit.) has shown that with Fe or Pt terminals the arc discharge is intermittent. Arons has shown that this is also the case with Hg terminals, but no interruption has been detected with terminals of C, Ag or Cu. The preceding measurements refer to mean potentials, and no conclusions as to the actual potential differences at any time can be drawn when the discharge is discontinuous, unless we know the law of discontinuity. The case with which an arc is sustained depends greatly on the nature of the electrodes; when they are brass, zinc, cadmium, or magnesium it is exceedingly difficult to get the arc.

The potential difference between the terminals is affected by the pressure of the gas. The most extensive series of experiments on this point is that made by Duncan, Rowland, and Tod (Electrician,
The nature of the gas also affects the potential difference. The magnitude of this effect may be gathered from the following values given by Arons (Ann. der Phys. 1, p. 700) for the potential difference required to produce an arc 1.5 mm. long, carrying a current of 4-5 amperes, between terminals of different metals in air and pure nitrogen.

Thus, with the discharge for an arc of given length and current, the nature of the terminals is the most important factor in determining the potential difference. The effects produced by the pressure and nature of the surrounding gas, although quite appreciable, are not of so much importance, while in the spark discharge the nature of the terminals is of no importance, everything depending upon the nature and pressure of the gas.

The potential gradient in the arc is very far from being uniform. We have given in Fig. 20, which shows the form of an arc at various magnifications, the shape of the arc at a pressure of 0.09 mm. for 4-5 amperes. The arc is shown at different times, being 100 times longer than in the diagram and the distance between the cathode and anode is much less than the diagram shows.

The arrangement of the arc in the tube is shown in Fig. 21, which shows the form of the arc at a pressure of 0.09 mm. for 4-5 amperes. The arc is shown at different times, being 100 times longer than in the diagram and the distance between the cathode and anode is much less than the diagram shows.

The case of the arc when the cathode is a pool of mercury and the anode a metal wire placed in a vessel from which the air has been exhausted is one which has attracted much attention, and important investigations on this point have been made by Hewitt (Electrician, 52, p. 447), Wills (Electrician, 54, p. 26), Stark, Retschinsky and Schnaposnoff (Ann. der Phys. 18, p. 217) and Pollak (Ann. der Phys. 10, p. 217). In this arrangement the mercury is vaporized by the heat, and the discharge which passes through the mercury vapour gives an exceedingly bright light, which has been largely used for lighting factories, &c.

The arrangement can also be used as a rectifier, for a current will only pass through it when the mercury pool is the cathode. Thus if such a lamp is connected with an alternating current circuit, it lets through the current in one direction and stops that in the other, thus furnishing a current which is always in one direction.

Theory of the Arc Discharge.—An incandescent body such as a piece of carbon even when at a temperature far below that of the terminals in an arc, emits corpuscles at a rate corresponding to a current of the order of 1 ampere per square centimetre of incandescent surface, and as the rate of increase of emission with the temperature is very rapid, it is probably at the rate of many amperes per square centimetre at the temperature of the negative carbon in the arc. If then a piece of carbon were maintained at this temperature by some external means, and used as a cathode, a current could be sent from it to another electrode whether the second electrode were cold or hot. If, however, these negatively electrified corpuscles did not produce other ions either by collision with the gas through which they move or with the anode, the spaces between cathode and anode would have a negative charge, which would tend to stop the corpuscles leaving the cathode and would require a large potential difference between anode and cathode to produce any considerable current. If, however, there is ionization either in the gas or at the anode, the positive ions will diffuse into the region of the discharge until they are sensibly equal in number to the negative ions. When this is the case the back electromotive force is destroyed and the same potential difference will carry a much larger current. The arc discharge may be regarded as analogous to the discharge between incandescent terminals, the only difference being that in the arc the terminals are maintained in the state of incandescence by the current and not by external means. On this view the cathode is bombarded by positive ions which heat it to such a temperature that negative corpuscles sufficient to carry the current are emitted from it. These corpuscles bombard the anode and keep it incandescent. They ionize also, either directly by collision or indirectly by heating the anode, the gas and vapour of the metal of which the anode is made, and produce in this way the supply of positive ions which keep the cathode hot.

Discharge from a Point.—A very interesting case of electric discharge is that between a sharply pointed electrode, such as a needle, and a metal surface of considerable area. At atmospheric pressures the luminosity is confined to the immediate neighbourhood of the point. If the sign of the potential of the point does not change, the discharge is carried by ions of one sign—that of the charge on the pointed electrode. The velocity of these ions under a given potential gradient has been measured by Chattock (Phil. Mag. 32, p. 283), and found to agree with that of the ions produced by Röntgen or uranium radiation, while Townsend (Phil. Trans. 195, p. 259) has shown that the charge on these ions is the same as that on the ions streaming from the point. If a pointed electrode is placed at right angles to a metal plane serving as the other electrode, the discharge takes place when, for a given distance of the point from the plane, the potential difference between the electrodes exceeds a definite value depending upon the pressure and nature of the gas through which the discharge passes; its value also depends upon whether, beginning with a small potential difference, we gradually increase it until discharge commences, or, beginning with a large potential difference, we decrease it until the discharge stops. The value found by the latter method is less than that by the former. According to Chattock's measurements the potential difference \( V \) for discharge between the point and the plane is given by the linear relation \( V = a + bl \); where \( l \) is the distance of the point from the plate and \( a \) and \( b \) are constants. From V. Obermayer's (Wien. Ber. 100, 2, p. 127) experiments, in which the distance \( l \) was greater than in Chattock's, it would seem that the potential for larger distances does not increase quite so rapidly with \( l \) as is indicated by Chattock's relation. The potential required to produce this discharge is much less than that required to produce a spark of length \( l \) between parallel plates; thus from Chattock's experiments to produce the point discharge when \( l = 5 \) cm. in air at atmospheric pressure requires a potential difference of about 3800 volts when the pointed electrode is positive, while to produce a spark at the same distance between plane electrodes, would require a potential difference of about 15000 volts. Chattock showed that with the same pointed electrode the value of the electric intensity at the point was the same whatever the distance of the point from the plane. The value of the electric intensity depended upon the sharpness of the point. When the end of the pointed electrode is a hemisphere of radius \( a \), Chattock showed that for the same gas at the same pressure the electric intensity \( f \) when discharge takes place is roughly proportioned to \( a^{-8} \). The value of the electric intensity at the pointed electrode is much greater than its value at a plane electrode for much smaller sparks; but we must remember that at a distance from a pointed electrode equal to a small multiple of the radius of curvature of its extremity the electric intensity falls very far.
below that required to produce discharge in a uniform field, so that the discharge from a pointed electrode ought to be compared with a spark whose length is comparable with the radius of curvature of the point. For such short sparks the electric intensity is very high. The electric intensity required to produce the discharge from a gas diminishes as the pressure of the gas diminishes, but not nearly so rapidly as the electric intensity for long sparks. Here again the discharge from a point is comparable with short sparks, which, as we have seen, are much less sensitive to pressure changes than longer ones. The minimum potential at which the electricity streams from the point does not depend upon the material of which the point is made; it varies, however, considerably with the nature of the gas. The following are the results of some experiments on this point. Those in the first two columns are due to Röntgen, those in the third and fourth to Precht:

We see from this table that in the case of the discharge from a positively electrified point the greater the molecular weight of the gas the greater the potential required for discharge. Röntgen concluded from his experiments that the discharging potential from a positive point in different gases at the same pressure varies inversely as the mean free path of the molecules of the gas. In the same gas, however, at different pressures the discharging potential does not vary so quickly with the pressure as does the mean free path. In Precht's experiments, in which different gases were used, the variations in the discharging potential are not so great as the variations in the mean free path of the gases.

The current of electrified air flowing from the point when the electricity is escaping—the well-known "electrical wind"—is accompanied by a reaction on the point which tends to drive it backwards. This reaction has been measured by Arrhenius (Wied. Ann. 63, p. 305), who finds that when positive electricity is escaping from a point in air the reaction on the point for a given current varies inversely as the pressure of the gas, and for different gases (air, hydrogen and carbonic acid) inversely as the square root of the molecular weight of the gas. The reaction when negative electricity is escaping is much less. The proportion between the reactions for positive and negative currents depends upon the pressure of the gas. Thus for equal positive and negative currents in air at a pressure of 70 cm. the reaction for a positive point was 1-9 times that of a negative one, at 40 cm. pressure 2-6 times, at 20 cm. pressure 3-2 times, at 10 cm. pressure 7 times, and at 5 cm. pressure 15 times the reaction for the negative point. Investigation shows that the reaction should be proportional to the quotient of the current by the velocity acquired by an ion under unit potential gradient. Now this velocity is inversely proportional to the pressure, so that the reaction should on this view be directly proportional to the pressure. This agrees with Arrhenius' results when the point is positive. Again, the velocities of an ion in hydrogen, air and carbonic acid at the same pressure are approximately inversely proportional to the square roots of their molecular weights, so that the reaction should be directly proportional to this quantity. This also agrees with Arrhenius' results for the discharge from a positive point. The velocity of the negative ion is greater than that of a positive one under the same potential gradient, so that the reaction for the negative point should be less than that for a positive one, but the excess of the positive reaction over the negative is much greater than that of the velocity of the negative ion over the velocity of the positive. There is, however, reason to believe that a considerable condensation takes place around the negative ion as a nucleus after it is formed, so that the velocity of the negative ion, under a given potential, is greater immediately after the ion is formed than when it has existed for some time. The measurements which have been made of the velocities of the ions relate to those which have been some time in existence, but a large part of the reaction will be due to the newly-formed ions moving with a greater velocity, and thus giving a smaller reaction than that calculated from the observed velocity.

With a given potential difference between the point and the neighbouring conductor the current issuing from the point is greater when the point is negative than when it is positive, except in oxygen, when it is less. Warburg (Sitz. Akad. d. Wissensch. zu Berlin, 1899, 56, p. 770) has shown that the addition of a small quantity of oxygen to nitrogen produces a great diminution in the current from a negative point, but has very little effect on the discharge from a positive point. Thus the removal of a trace of oxygen made a leak from a negative point 50 times what it was before. Experiments with hydrogen and helium showed that impurities in these gases had a great effect on the current when the point was negative, and but little when it was positive. This suggests that the impurities, by condensing round the negative ions as nuclei, seriously diminish their velocity. If a point is charged up to a high and rapidly alternating potential, such as can be produced by the electric oscillations started when a Leyden jar is discharged, then in hydrogen, nitrogen, ammonia and carbonic acid gas a conductor placed in the neighbourhood of the point gets a negative charge, while in air and oxygen it gets a positive one. There are two considerations which are of importance in connexion with this effect. The first is the velocity of the ions in the electric field, and the second the ease with which the ions can give up their charges to the metal point. The greater velocity of the negative ions would, if the potential were rapidly alternating, cause an excess of negative ions to be left in the surrounding gas. This is the case in hydrogen. If, however, the metal had a much greater tendency to unite with negative than with positive ions, such as we should expect to be the case in oxygen, this would act in the opposite direction, and tend to leave an excess of positive ions in the gas.

The Characteristic Curve for Discharge through Gases.—When a current of electricity passes through a metallic conductor the relation between the current and the potential difference is the exceedingly simple one expressed by Ohm's law; the current is proportional to the potential difference. When the current passes through a gas there is no such simple relation. Thus we have already mentioned cases where the current increased as the potential increased although not in the same proportion, while as we have seen in certain stages of the arc discharge the potential difference diminishes as the current increases. Thus the problem of finding the current which a given battery will produce when part of the circuit consists of a gas discharge is much more complicated than when the circuit consists entirely of metallic conductors. If, however, we measure the potential difference between the electrodes in the gas when different currents are sent through it, we can plot a curve, called the "characteristic curve," whose ordinates are the potential differences between the electrodes in the gas and the abscissae the corresponding currents. By the aid of this curve we can calculate the current produced when a given battery is connected up to the gas by leads of known resistance.

For let \( E_0 \) be the electromotive force of the battery, \( R \) the resistance of the leads, \( i \) the current, the potential difference between the terms in the gas will be \( E_0 - Ri \). Let \( ABC \) (fig. 22) be the characteristic curve, the ordinates being the potential difference between the terminals in the gas, and the abscissae the current. Draw the line \( LM \) whose equation is \( E = E_0 - Ri \), then the points where this line cuts the characteristic curves will give possible values of \( f \) and \( E \), the current through the discharge tube and the potential difference between the terminals. Some of these points may, however, correspond to an unstable position and be impossible to realize. The following method gives us a criterion by which we can distinguish the stable from the unstable positions. If the current
CONDUCTION, ELECTRIC

GASES]

is increased by $\delta t$, the electromotive force which has to be overcome by the battery is $R \delta t + \frac{dE}{dt}$. If $R + \frac{dE}{dt}$ is positive there will be an unbalanced electromotive force round the circuit tending to stop the current. Thus the increase in the current will not continue, and the condition will be a stable one. If, however, $R + \frac{dE}{dt}$ is negative there will be an unbalanced electromotive force tending to increase the current still further; thus the current will go on increasing and the condition will be unstable. Thus for stability $R + \frac{dE}{dt}$ must be positive, a condition first given by Kaufmann (Ann. der Phys. 11, p. 158). The geometrical interpretation of this condition is that the straight line LM must, at the point where it cuts the characteristic curve, be steeper than the tangent to characteristic curve. Thus of the points ABC where the line cuts the curve in fig. 22, A and C correspond to stable states and B to an unstable one. The state of things represented by a point P on the characteristic curve when the slope is downward cannot be stable unless there is in the external circuit a resistance greater than that represented by the tangent of the inclination of the tangent to the curve at P to the horizontal and equals the external electromotive force, since the internal resistance due to the motion of the charge will increase with the rate of increase of the current. Thus if the external electromotive force is kept constant there is a minimum value of the current for the luminous discharge. If the current is reduced below this value, the discharge ceases to be luminous, and there is an abrupt diminution in the current.

Cathode Rays.—When the gas in the discharge tube is at a very low pressure some remarkable phenomena occur in the neighbourhood of the cathode. These seem to have been first observed by Plettker (Pogg. Ann. 107, p. 77; 116, p. 45) who noticed on the walls of the glass tube near the cathode a greenish phosphorescence, which he regarded as due to rays proceeding from the cathode, striking against the sides of the tube, and then travelling back to the cathode. He found that the action of a magnet on these rays was not the same as the action on the part of the discharge near the positive electrode. Hittorf (Pogg. Ann. 136, p. 8) showed that the agent producing the phosphorescence was intercepted by a solid, whether conductor or insulator, placed between the cathode and the glass of the tube. He regarded the phosphorescence as caused by a motion starting from the cathode and travelling in straight lines through the glass.

Goldstein (Monat. der Berl. Akad., 1876, p. 24) confirmed this discovery of Hittorf's, and further showed that a distinct, though not very sharp, shadow is cast by a small object placed near a large plane cathode. This is a proof that the rays producing the phosphorescence must be emitted almost normally from the cathode, and not, like the rays of light from a luminous surface, in all directions, for such rays would not produce a perceptible shadow if a small body were placed near the plane. Goldstein regarded the phosphorescence as due to waves in the ether, for whose propagation the gas was not necessary. Crookes (Phil. Trans., 1879, pt. i. p. 153; pt. ii. pp. 557, 661), who made many remarkable researches in this subject, took a different view. He regarded the rays as strongly electrified negatively charged particles projected normally from the cathode with great velocity, and, while the pressure is sufficiently low, reaching the sides of the tube, and by their impact producing phosphorescence and heat. The rays on this view are deflected by a magnet, because a magnet exerts a force on a charged moving body.

These rays striking against glass make it phosphorescent. The colour of the phosphorescence depends on the kind of glass; thus the light from soda glass is a yellowish green, and that from lead glass blue. Many other bodies phosphoresce when exposed to these rays, and in particular the phosphorescence of some gems, such as rubies and diamonds, is exceedingly vivid. The spectrum of the phosphorescent light is generally continuous, but Crookes showed that the phosphorescence of some of the rare earths, such as yttrium, gives a spectrum of bright bands, and he founded on this fact a spectroscopic method of great importance. Goldstein (Wied. Ann. 54, p. 371) discovered that the haloid salts of the alkali metals change colour under the rays, sodium chloride, for example, becoming violet. The colouration is a surface one, and has been traced by E. Wiedemann and Schmi dt (Wied. Ann. 54, p. 618) to the formation of a halochrome. Chlorides of tin, mercury and lead also change colour in the same way. E. Wiedemann (Wied. Ann. 56, p. 201) discovered another remarkable effect, which he called thermo-luminescence; he found that many bodies after being exposed to the cathode rays possess for some time the power of becoming luminous when their temperature is raised to a point far below that at which they become luminous in the normal state. Substances belonging to the class called by van't Hoff solid solutions exhibit this property of thermo-luminescence to a remarkable extent. They are formed when two salts, one greatly in excess of the other, are simultaneously precipitated from a solution. A trace of MnSO\textsubscript{4} in CaSO\textsubscript{4} shows very brilliant thermo-luminescence.

The impact of cathode rays produces after a time perceptible changes in the glass. Crookes (Phil. Trans. pt. ii. 1879, p. 645) found that after glass has been phosphorescing for some time under the cathode rays it seems to get tired, and the phosphorescence is not so bright as it was initially. Thus, for example, when the shadow of a Maltese cross is thrown on the walls of the tube as in fig. 23, if after the discharge has been going on for some time the cross is shaken down or a new cathode used whose line of fire does not cut the cross, the pattern of the cross will still be seen on the glass, but it will now be brighter instead of darker than the surrounding portion. The portions shielded by the cross, not being tired by being made to phosphoresce for a long time, respond more vigorously to the stimulus than those portions which have not been exposed. Skinner (Proc. Camb. Phil. Soc. ix. p. 371) and Thomson found on the glass which had been exposed to the rays gelatinous filaments, apparently silica, resulting from the reduction of the glass. A reducing action was also noticed by Villard (Journ. de phys. 3, viii. p. 140) and Wehnelt (Wied. Ann. 67, p. 421). It can be well shown by letting the rays fall on a plate of oxidized copper, when the part struck by the rays will become bright. The rays heat bodies on which they fall, and if they are concentrated by using as a cathode a portion of a spherical surface, the heat at the centre becomes so great that a piece of platinum wire can be melted or a diamond charred. Measurements of the heating effects of the rays have been made by Thomson (Phil. Mag. [5], 44, p. 293) and Cady (Ann. der Phys. 2, p. 678). Crookes (Phil. Trans., 1879, pt. i. p. 152) showed that a vane mounted as a radiometer is set in rotation by the rays, the direction of the rotation being the same as would be produced by a stream of particles proceeding from the cathode. The movement is not due to the momentum imparted to the vanes by the rays, but to the difference in temperature between the sides of the vanes, the rays making the side against which they strike hotter than the other.

Effect of a Magnet.—The rays are deflected by a magnet, so that the distribution of phosphorescence over the glass and the shape and position of the shadows cast by bodies in the tube are altered by the proximity of a magnet. The laws of magnetic deflection of these rays have been investigated by Plettker (Pogg.
Ann. 103, p. 88), Hittori (Pogg. Ann. 136, p. 213), Crookes (Phil. Trans., 1879, pt. 1, p. 557), and Schuster (Proc. Roy. Soc. 47, 1905). The deflection is the same as that of negatively electrified particles travelling along the path of the rays. Such particles would in a magnetic field be actuated on by a force at right angles to the direction of motion of the particle and also to the magnetic force, the magnitude of the force being proportional to the product of the velocity of the particle, the magnetic force, and the sine of the angle between these vectors. In this case we have seen that if the particle is not acted on by an electrostatic field, the path in a uniform magnetic field is a spiral, which, if the magnetic force is at right angles to the direction of projection of the particle, becomes a circle in the plane at right angles to the magnetic force, the radius being \(mv/He\), where \(m, v, e\) are respectively the mass, velocity and charge on the particle, and \(H\) is the magnetic force. The smaller the difference of potential between the electrodes of the discharge tube the greater the deflection produced by a magnetic field of given strength, and as the difference of potential rapidly increases with diminishing pressure, after a certain pressure has been passed, the higher the exhaustion of the tube the less the magnetic deflection of the rays.

Birkeland (Comptes rendus, 1896, p. 493) has shown that when the discharge is from an induction coil the cathode rays produced in the tube at any one time are not equally deflected by a magnet, but that a narrow patch of phosphorescence when deflected by a magnet is split up into several distinct patches, giving rise to what Birkeland calls the "magnetic spectrum." Strutt (Phil. Mag. 48, p. 478) has shown that this magnetic spectrum does not occur if the discharge of a large number of cells is employed instead of the coil. Thomson (Proc. Camb. Phil. Soc. 9, p. 243) has shown that if the potential difference between the electrodes is kept the same the magnetic deflection is independent of the nature of the gas filling the discharge tube; this was tested with gases so different as air, hydrogen, carbonic acid and methyl iodide.

**Charge of Negative Electricity carried by the Rays.**—We have seen that the rays are deflected by a magnet, as if they were particles charged with negative electricity. Perrin (Comptes rendus, 121, p. 1330) showed by direct experiment that a stream of negative electricity is associated with the rays. A modification made by Thomson of Perrin's experiment is sketched in fig. 24 (Phil. Mag. 48, p. 478).

The rays start from the cathode A, and pass through a slit in a solid brass rod B fitting tightly into the neck of the tube. This rod is connected with earth and used as a conductor. The experiments were performed by passing through the slit a layer through the vessel C. D and E are two insulated metal cylinders insulated from each other, and earthed having a slit cut in its face so as to enable the rays to pass into the inside of the inner cylinder, which is connected with an electrostatic machine, the outer cylinder being connected with earth. The two cylinders are placed on the far side of the vessel, but not so far as to cut off the line of fire of the rays. When the rays go straight through the slit, there is only a very small negative charge communicated to the inner cylinder, but when they are deflected by a magnet so that the phosphorescent patch falls on the slit in the outer cylinder the inner cylinder receives a very large negative charge. The increase in the unexpected charge is observed by the appearance of a stream of negative electrification. The same apparatus can be used to show that the passage of cathode rays through a gas makes it a conductor of electricity. For if the induction coil is kept running and a stream of the rays kept steadily going into the inner cylinder, the potential of the inner cylinder reaches a definite negative value below which it does not fall, however long the rays may be kept going. The cylinder reaches a steady state in which the gain of negative electrification from the cathode rays is equal to the loss by leakage through the conductivity being produced by the passage of the rays through it. If the inner cylinder is charged up initially with a greater negative charge than corresponds to the steady state, on turning the rays on to the cylinder the negative charges decrease, and not till it reaches the steady state. The conductivity produced by the passage of cathode rays through a gas diminishes rapidly with the pressure. When rays pass through a gas at a low pressure, they are deflected by an electric field, but the pressure of the gas is higher the conductivity being produced when the cathode rays pass through it is so large that the potential gradient cannot reach a sufficiently high value to produce an appreciable deflection.

Thus the cathode rays carry a charge of negative electricity; the experiment described on page 875 (fig. 13) shows that they are deflected by a magnet and may be electrified, and are acted on by a magnetic force in just the way this force would act on a negatively electrified body moving along the path of the rays. There is therefore every reason for believing that they are charges of negative electricity in rapid motion. By measuring the deflection produced by magnetic and electric fields we can determine the velocity with which these particles moved and the ratio of the mass of the particle to the charge carried by it.

We may conclude from the experiments that the value of \(m/e\) for the particles constituting the cathode rays is of the order \(1/1-7\times10^9\), and we have seen that \(m/e\) has the same value in all the other cases of negative ions in a gas at low pressure for which it has been measured—viz. for the ions produced when ultra-violet light falls on a metal plate, or when an incandescent carbon filament is surrounded by a gas at a low pressure, and for the \(B\) particles given out by radio-active bodies. We have also seen that the value of the charge on the gaseous ion, in all cases, is of the same order, \(m/e\) has the same value, and it has been measured that \(m/e\) is very small for some rays produced by Röntgen and uranium radiation, by ultra-violet light, and by the discharge of electrification from a point,—is the same in magnitude as the charge carried by the hydrogen atom in electrolysis of solutions. The mass of the hydrogen alone is, however, \(10^{-9}\) times this charge, while the mass of the carriers of negative electrification is only \(1/1-7\times10^9\) times the charge; hence the mass of the carriers of the negative electrification is only \(17/3\) of the mass of the hydrogen atom. We are thus, by the study of the electric discharge, forced to recognize the existence of masses very much smaller than the smallest mass hitherto recognized.

Direct determinations of the velocity of the cathode rays have been made by J. J. Thomson (Phil. Mag. 38, p. 338), who measured the initial velocity between two parallel plates 1-2 cm. apart, and by Maiorana (Nuovo Cimento, 4, p. 336) and Battelli and Stefani (Phys. Zeit. 3, p. 51), who measured the interval between the arrival of the negative charge carried by the rays at two places separated by a known distance. The values of the velocity got in this way are much smaller than the values got by the indirect methods previously described: thus J. J. Thomson at a fairly high pressure found the velocity to be \(2\times10^7\) cm./sec., Maiorana found values ranging between \(10^7\) and \(6\times10^7\) cm./sec., and Battelli and Stefani values ranging from \(6\times10^6\) to \(1\times10^7\). In methods of this kind it is very difficult to eliminate the effect of the interval which elapses between the time at which the rays enter the apparatus and the time at which they are detected, such as the phosphorescence of the glass or the deflection of the electrometer, of sufficient intensity to affect the senses.

**Transmission of Cathode Rays through Solids—Lenard Rays.**—It was for a long time believed that all solids were absolutely opaque to these rays, as Crookes and Goldstein had proved that very thin glass, and even a film of collodion, cast intensely black shadows. Hertz (Wied. Ann. 45, p. 38), however, showed that behind a piece of gold-leaf or aluminium foil an appreciable amount of phosphorescence occurred on the glass, and that the phosphorescence moved when a magnet was brought near. A most important advance was next made by Lenard (Wied. Ann. 51, p. 223), who got the cathode rays to pass through a discharge tube to the air outside. For this purpose he used a tube like that shown in fig. 25. The cathode K is an aluminium disc 1 cm. in diameter fastened to a stiff wire, which is surrounded by a glass tube. The anode A is a brass strip partly
surrounding the cathode. The end of the tube in front of the cathode is closed by a strong metal cap, fastened in with marine glue, in the middle of which a hole 1.7 mm. in diameter is bored, and covered with a piece of very thin aluminium foil about 0.002 in. in thickness. The aluminium window is in metallic contact with the tube, and this and the anode are connected with the earth. The tube is then exhausted until the cathode rays strike against the window. Diffuse light spreads from the window into the air outside the tube, and can be traced in a dark room for a distance of several centimetres. From the window, too, proceed rays which, like the cathode rays, can produce phosphorescence, for certain bodies phosphoresce when placed in the neighbourhood of the window. This effect is conveniently observed by the platino-cyanide screens used to detect Röntgen radiation. The properties of the rays outside the tube resemble in all respects those of cathode rays; they are deflected by a magnet and by an electric field, they ionize the gas through which they pass and make it a conductor of electricity, and they affect a photographic plate and change the colour of the haloid salts of the alkali metals. As, however, it is convenient to distinguish between cathode rays outside and inside the tube, we shall call the former Lenard rays. In air at atmospheric pressure the Lenard rays spread out very diffusely. If the aluminium window, instead of opening into the air, opens into another tube which can be exhausted, it is found that the lower the pressure of the gas in this tube the farther the rays travel and the less diffuse they are. By filling the tube with different gases Lenard showed that the greater the density of the gas the greater is the absorption of these rays. Thus they travel farther in hydrogen than in any other gas at the same pressure. Lenard showed, too, that if he adjusted the pressure so that the density of the gas in this tube was the same—if, for example, the pressure when the tube was filled with oxygen was $\frac{1}{2}$ of the pressure when it was filled with hydrogen—the absorption was constant whatever the nature of the gas. Becker (Ann. der Phys. 17, p. 381) has shown that this law is only approximately true, the absorption by hydrogen being abnormally large, and by the inert monatomic gases, such as helium and argon, abnormally small. The distance to which the Lenard rays penetrate into this tube depends upon the pressure in the discharge tube; if the exhaustion in the latter is very high, so that there is a large potential difference between the cathode and the anode, and therefore a high velocity for the cathode rays, the Lenard rays will penetrate farther than when the pressure in the discharge tube is higher and the velocity of the cathode rays smaller. Lenard showed that the greater the penetrating power of his rays the smaller was their magnetic deflection, and therefore the greater their velocity; thus the greater the velocity of the cathode rays the greater is the velocity of the Lenard rays to which they give rise. For very slow cathode rays the absorption by different gases is in proportion to their density, so much so that the absorption of these rays by hydrogen is greater than that by air (Lenard, Ann. der Phys. 12, p. 732). Lenard (Wied. Ann. 56, p. 255) studied the passage of his rays through solids as well as through gases, and arrived at the very interesting result that the absorption of a substance depends only upon its density, and not upon its chemical composition or physical state; in other words, the amount of absorption of the rays when they traverse a given distance depends only on the quantity of matter they cut through in the distance. McClelland (Proc. Roy. Soc. 61, p. 227) showed that the rays carry a charge of negative electricity, and M'Lenann measured the amount of ionization rays of given intensity produced in different gases, finding that if the pressure is adjusted so that the density of the different gases is the same the number of ions per cubic centimetre is also the same. In this case, as Lenard has shown, the absorption is the same, so that with the Lenard rays, as with uranium and probably with Röntgen rays, equal absorption corresponds to equal ionization. A convenient method for producing Lenard rays of great intensity has been described by Des Coudres (Wied. Ann. 62, p. 134).

**Diffuse Reflection of Cathode Rays.**—When cathode rays fall upon a surface, whether of an insulator or a conductor, cathode rays start from the surface in all directions. This phenomenon, which was discovered by Goldstein (Wied. Ann. 62, p. 134), has been investigated by Starke (Wied. Ann. 66, p. 49; Ann. der Phys. 111, p. 72), Austin and Starke (Ann. der Phys. 9, p. 271), Campbell–Swinton (Proc. Roy. Soc. 64, p. 377), Merritt (Phys. Rev. 7, p. 217) and Gehrcke (Ann. der Phys. 8, p. 81); it is often regarded as analogous to the diffuse reflection of light from such a surface as a soap bubble, and is spoken of as the diffuse reflection of the cathode rays. According to Merritt and Austin and Starke the deviation in a magnetic field of these reflected rays is the same as that of the incident rays. The experiments, however, were confined to rays reflected so that the angle of reflection was nearly equal to that of incidence. Gehrcke showed that among the reflected rays there were a large number which had a much smaller velocity than the incident ones. According to Campbell–Swinton the "diffuse" reflection is accompanied by a certain amount of "specular" reflection. Lenard, who used slower cathode rays than Austin and Starke, could not detect in the scattered rays any with velocities comparable with that of the incident rays; he obtained copious supplies of slow rays whose speed did not depend on the angle of incidence of the primary rays (Ann. der Phys. 15, p. 485). When the angle of incidence is very oblique the surface struck by the rays gets positively charged, showing that the secondary rays are more numerous than the primary.

**Repulsion of two Cathode Streams.**—Goldstein discovered that if in a tube there are two cathodes connected together, the cathodic rays from one cathode are deflected when they pass near the other. Experiments bearing on this subject have been made by Crookes and Wiedemann and Ebert. The phenomena may be described by saying that the repulsion of the rays from a cathode A by a cathode B is only appreciable when the rays from A pass through the Crookes dark space round B. This is what we should expect if we remember that the electric field in the dark space is far stronger than in the rest of the discharge, and that the gas in the other parts of the tube is rendered a conductor by the passage through it of the cathode rays, and therefore incapable of transmitting electrostatic repulsion.

**Scattering of the Negative Electrodes.**—In addition to the cathode rays, portions of metal start normally from the cathode and form a metallic deposit on the walls of the tube. The amount of this deposit varies very much with the metal. Crookes (Proc. Roy. Soc. 59, p. 88) found that the quantities of metal torn from electrodes of the same size, in equal times, by the same current, are in the order Pb, Au, Ag, Pb, Sn, Pt, Cu, Cd Ni, In, Fe... In air there is very little deposit from an Al cathode, but it is abundant in tubes filled with the monatomic gases, mercury vapour, argon or helium. The scattering increases as the density of the gas diminishes. The particles of metal are at low pressures deflected by a magnet, though not nearly to the same extent as the cathode rays. According to Grandquist, the loss of weight of the cathode in a given time is proportional to the square of the current; it is therefore not, like the loss of the cathode in ordinary electrolysis, proportional to the quantity of current which passes through it.

**Positive Rays or "Canalstrahlen."**—Goldstein (Berl. Sitzungsbc. 39, p. 691) found that with a perforated cathode certain rays occurred behind the cathode which were not appreciably deflected by a magnet; these he called Canalstrahlen, but we shall, for reasons which will appear later, call them "positive rays." Their appearance is well shown in fig. 26, taken from a paper by Wehnelt (Wied. Ann. 67, p. 421) in which they are represented at B. Goldstein found
CONDUCTION OF HEAT

890

that their colour depends on the gas in which they are formed, being gold-colour in air and nitrogen, rose-colour in hydrogen, yellowish rose in oxygen, and greenish gray in carbonic acid.

The colour of the luminosity due to positive rays is not in general the same as that due to anode rays; the difference is exceptionally well marked in helium, where the cathode ray luminosity is blue while that due to the positive rays is red. The luminosity produced when the rays strike against solids is also quite distinct. The cathode rays make the body emit a continuous spectrum, while the spectrum produced by the positive rays often shows bright lines. Thus lithium chloride under cathode rays gives out a steely blue light and the spectrum is continuous, while under the positive rays the salt gives out a brilliant red light and the spectrum shows the red helium line. It is remarkable that the lines on the spectra of the alkali metals are much more easily produced when the positive rays fall on the oxide of the metal than when they fall on the metal itself. Thus when the positive rays fall on a pool of the liquid alloy of sodium and potassium the specks of oxide on the surface shine with a bright yellow light while the unparted mass of the surface is quite dark.

W. Wien (Wied. Ann. 65, p. 445) measured the values of \(e/m\) for the particles forming the positive rays. Other measurements have been made by Ewers (Wied. Ann. 69, p. 167) and J. J. Thomson (Phil. Mag. 13, p. 561). The differences between the values of \(e/m\) for the cathode and positive rays are very remarkable. For cathode rays whose velocity does not approach that of light, \(e/m\) is always equal to \(1.7 \times 10^8\), while for the positive rays the greatest value of this quantity yet observed is \(10^8\), which is also the value of \(e/m\) for the hydrogen ions in the electrolysis of dilute solutions. In some experiments made by J. J. Thomson (Phil. Mag. 14, p. 359) it was found that when the pressure of the gas was not too low the bright spot produced by the impact of a pencil of these rays on a phosphorescent screen is deflected by electric and magnetic forces in a continuous band extending on both sides of the undetected position. The portion on one side is in general much fainter than that on the other. The direction of this deflection shows that it is produced by particles charged with negative electricity, while the brighter band is due to particles charged with positive electricity. The negatively electrified particles which produce the band are corpuscles, from the electric and magnetic deflections we can find the value of \(e/m\). As this proves to be equal to \(10^8\), we see that the mass of the carrier of the negative charge is comparable with that of an atom, and so very much greater than that of a corpuscle. At very low pressures part of the phosphorescence disappears, while the upper portion breaks up into two patches (fig. 27). For one of these the maximum value of \(e/m\) is \(10^8\) and for the other \(5 \times 10^8\). At low pressures the appearance of the patches and the values of \(e/m\) are the same whether the tube is filled originally with air, hydrogen or helium. In some of the experiments the tube was exhausted until the pressure was too low to allow the discharge to pass. A very small quantity of the gas under investigation was then admitted into the tube, just sufficient to allow the discharge to pass, without the deflection of the phosphorescent patch measured. The following gases were admitted into the tube: carbon dioxide, oxide, oxygen, hydrogen, helium, argon and neon, but whatever the gas the appearance of the phosphorescence was the same; in every case there were two patches, for one of which \(e/m = 10^8\) and for the other \(e/m = 5 \times 10^8\). In helium at higher pressures another patch was observed, for which \(e/m = 2 \times 10^8\). The continuous band into which the phosphorescent spot is drawn out when the pressure is not exceedingly low, which involves the existence of particles for which the mean value of \(e/m\) varies from zero to \(10^9\), can be explained as follows. The rays on their way to the phosphorescent screen have to pass through gas which is ionized by the passage through it of the positive rays; this gas will therefore contain free corpuscles. The particles which constitute the rays start with a charge of positive electricity. Some of these particles in their journey through the gas attract a corpuscle whose negative charge neutralizes the positive charge on the particle. The particles when in this neutral state may be ionized by collision and reacquire a positive charge, or by attracting another particle may become negatively charged, and this process may be repeated several times on their journey to the phosphorescent screen. Thus some of the particles, instead of being positively charged for the whole of the time they are exposed to the electric and magnetic forces, may be for part of that time without a charge or even have a negative charge. The deflection of a particle is proportional to the average value of its charge whilst under the influence of the deflecting forces. Thus if a particle is without a charge for a part of the time, its deflection will be less than that of a particle which has retained its positive charge for the whole of its journey, while the few particles which have a negative charge for a longer time than they have a positive will be deflected in the opposite direction to the main portion and will produce the tail (fig. 27).

A similar explanation will apply to the positive rays discovered by Villard (Comptes rendus, 143, p. 674) and J. J. Thomson (Phil. Mag. 13, p. 359), which travel in the opposite direction to the rays we have been considering, i.e. they travel away from the cathode and in the direction of the cathode's rays; these rays are sometimes called "retrograde" rays. These as far as has been observed have always the same maximum value of \(e/m\), i.e. \(10^8\), and there are a considerable number of negative ones always mixed with them. The maximum velocity of both the positive and retrograde rays is about \(2 \times 10^8\) cm./sec, and varies very little with the potential difference between the electrodes in the tube in which they are produced (J. J. Thomson, Phil. Mag. Dec. 1909).

The positive rays show, when the pressure is not very low, the line spectrum of the gas through which they pass. An exceedingly valuable set of observations on this point have been made by Stark and his pupils (Physik. Zeit. 6, p. 892; Ann. der Phys. 21, pp. 40, 457). Stark has shown that in many gases, notably hydrogen, the spectrum shows the Doppler effect, and he has been able to calculate in this way the velocity of the positive rays.

Anode Rays.—Gehrke and Reichenheim (Ann. der Phys. 25, p. 861) have found that when the anode consists of a mixture of sodium and lithium chloride raised to a high temperature either by the discharge itself or by an independent heating circuit, very conspicuous rays come from the anode when the pressure of the gas in the discharge tube is very low, and a large coil is used to produce the discharge. The determination of \(e/m\) for these rays showed that they are positively charged atoms of sodium or lithium, moving with very considerable velocity; in some of Gehrke's experiments the maximum velocity was as great as \(1.8 \times 10^8\) cm./sec., though the average was about \(10^7\) cm./sec. These velocities are less than those of the positive rays whose maximum velocity is about \(2 \times 10^8\) cm./sec. (J. J. T.)

CONDUCTION OF HEAT. The mathematical theory of conduction of heat was developed early in the 19th century by Fourier and other workers, and was brought to so high a pitch of excellence that little has remained for later writers to add to this department of the subject. In fact, for a considerable period, the term "theory of heat" was practically synonymous with the mathematical treatment of a conduction. But later experimental researches have shown that the simple assumption of constant coefficients of conductivity and emissivity, on which the mathematical theory is based, is in many respects inadequate, and the special mathematical methods developed by J. B. J. Fourier need not be considered in detail here, as they are in many cases of mathematical rather than physical interest. The main object of
the present article is to describe more recent work, and to discuss experimental difficulties and methods of measurement.

1. Mechanism of Conduction.—Conduction of heat implies transmission by contact from one body to another or between contiguous particles of the same body, but does not include transference of heat by the motion of masses or streams of matter from one place to another. This is termed convection, and is most important in the case of liquids and gases owing to their mobility. Conduction, however, is generally understood to include diffusion of heat in fluids due to the agitation of the ultimate molecules, which is really molecular convection. It also includes diffusion of heat by internal radiation, which must occur in transparent substances. In measuring conduction of heat in fluids, it is possible to some extent to eliminate the effects of molar convection or mixing, but it would not be possible to distinguish between diffusion, or internal radiation, and conduction. Some writers have supposed that the ultimate atoms are conductors, and that heat is transferred through them when they are in contact. This, however, is merely transferring the properties of matter in bulk to its molecules. It is much more probable that heat is really the kinetic energy of motion of these molecules, and is passed on from one to another by collisions. Further, if we adopt W. Weber's hypothesis of electric atoms, capable of diffusing through metallic bodies and conductors of electricity, but capable of vibration only in non-conductors, it is possible that the ultimate mechanism of conduction may be reduced in all cases to that of diffusion in metallic bodies or internal radiation in dielectrics. The high conductivity of metals is then explained by the small mass and high velocity of diffusion of these electric atoms. Assuming the kinetic energy of an electric atom at any temperature to be equal to that of a gaseous molecule, its velocity, on Sir J. J. Thomson’s estimate of the mass, must be upwards of forty times that of the hydrogen molecule.

2. Law of Conduction.—The experimental law of conduction, which forms the basis of the mathematical theory, was established in a qualitative manner by Fourier and the early experimentalists. Although it is seldom explicitly stated as an empirical law, it may be briefly worded as follows: “The rate of transmission of heat by conduction is proportional to the temperature gradient.”

The “rate of transmission of heat” is here understood to mean the quantity of heat transferred in unit time through unit area of cross-section of the substance, the unit area being taken perpendicular to the lines of flow. It is clear that the quantity transferred in any case must be jointly proportional to the area and the time. The “gradient of temperature” is the fall of temperature in degrees per unit length along the lines of flow. The thermal conductivity of the substance is the constant ratio of the rate of transmission to the temperature gradient. To take the simple case of the “wall” or flat plate considered by Fourier for the definition of thermal conductivity, suppose that a quantity of heat Q passes in the time T through an area A of a plate of conductivity k and thickness x, the sides of which are constantly maintained at temperatures θ’ and θ”. The rate of transmission of heat is Q/AT, and the temperature gradient, supposed uniform, is (θ’ - θ”)/x, so that the law of conduction leads at once to the equation

\[ Q/AT = k(\theta' - \theta'')/x = k d\theta/dx. \]  

This relation applies accurately to the case of the steady flow of heat in parallel straight lines through a homogeneous and isotropic solid, the isothermal surfaces, or surfaces of equal temperature, being planes perpendicular to the lines of flow. If the flow is steady, and the temperature of each point of the body invariable, the rate of transmission must be everywhere the same. If the gradient is not uniform, its value may be denoted by dθ/dx. In the steady state, the product kdx must be constant, or the gradient must vary inversely as the conductivity, if the latter is a function of θ or x. One of the simplest illustrations of the rectilinear flow of heat is the steady outflow through the upper strata of the earth’s crust, which may be considered practically plane in this connexion. This outflow of heat necessitates a rise of temperature with increase of depth. The corresponding gradient is of the order of 1° C. in 100 ft., but varies inversely with the conductivity of the strata at different depths.

3. Variable State.—A different type of problem is presented in those cases in which the temperature at each point varies with the time, as is the case near the surface of the soil with variations in the external conditions between day and night or summer and winter. The flow of heat may still be linear if the horizontal layers of the soil are of uniform composition, but the quantity flowing through each layer is no longer the same. Part of the heat is used up in changing the temperature of the successive layers. In this case it is generally more convenient to consider as unit of heat the thermal capacity c of unit volume, or that quantity which would produce a rise of one degree of temperature in unit volume of the soil or substance considered. If Q is expressed in terms of this unit in equation (1), it is necessary to divide by c, or to replace k on the right-hand side by the ratio k/c. This ratio determines the rate of diffusion of temperature, and is called the thermometric conductivity or, more shortly, the diffusivity. The velocity of propagation of temperature waves will be the same under similar conditions in two substances which possess the same diffusivity, although they may differ in conductivity.

4. Emissivity.—Fourier defined another constant expressing the rate of loss of heat at a bounding surface per degree of difference of temperature between the surface of the body and its surroundings. This he called the external conductivity, but the term emissivity is more convenient. Taking Newton’s law of cooling that the rate of loss of heat is simply proportional to the excess of temperature, the emissivity would be independent of the temperature. This is generally assumed to be the case in mathematical problems, but the assumption is admissible only in rough work, or if the temperature difference is small. The emissivity really depends on every variety of condition, such as the size, shape and position of the surface, as well as on its nature; it varies with the rate of cooling, as well as with the temperature excess, and it is generally so difficult to calculate, or to treat in any simple manner, that it forms the greatest source of uncertainty in all experimental investigations in which it occurs.

5. Experimental Methods.—Measurements of thermal conductivity present peculiar difficulties on account of the variety of quantities to be observed, the slowness of the process of conduction, the impossibility of isolating a quantity of heat, and the difficulty of exactly realizing the theoretical conditions of the problem. The most important methods may be classified roughly under three heads—(1) Steady Flow, (2) Variable Flow, (3) Electrical. The methods of the first class may be further subdivided according to the form of apparatus employed. The following are some of the special cases which have been utilized experimentally:

6. The “Wall” or Plate Method.—This method endeavours to realize the conditions of equation (1), namely, uniform rectilinear flow. Theoretically this requires an infinite plate, or a perfect conductor, so that the heat loss at each point may be neglected. This condition can generally be satisfied with sufficient approximation with plates of reasonable dimensions. To find the conductivity, it is necessary to measure all the quantities which occur in equation (1), i.e., the quantity of heat, the linear dimensions, the area, the thickness, and the temperature gradient. If the apparatus is so arranged that the heat is not collected near the surface, but removed by a current of air or some other means, the conductivity may be calculated from the quantity of heat, the linear dimensions, and the temperature difference at the surface. Provided the flow is uniform, it is possible to determine the thickness of metal. This method is not generally rather difficult to determine the effective area of a single crystal, as well as the area of a thin plate. The method is applicable to any case in which the temperature gradient is uniform over the surface, and it is necessary to assume that the temperature of the surfaces are the same as those of the media with which they are in contact, since there is no room to insert thermometers in the plate. It is used for the determination of the thermal slowness of heat in metals, such as glass or wood, but has given rise to large mistakes in the case of metals. The conductivity of thin slices of crystals have been measured by C. H. Lees (Phil. Trans., 1892) by pressing them between plane amalgamated surfaces of metal. This gives very good contact, and the conductivity of the metal being more than 100 times that of the crystal, the temperature of the surface is determined.
CONDUCTION

In applying the plate method to the determination of the conductivity of iron, E.H. Hall proposed to overcome this difficulty by coating the plate thickly with copper on both sides, and deducing the difference of temperature between the two surfaces of junction of the iron and the copper from the thermo-electric force observed by means of a smaller number of fine copper wires attached to the coating at different points of the disk. The advantage of the thermo-junction for this purpose is that the distance between the surfaces of which the temperature-difference is measured, is very exactly defined. The disadvantage of the thermo-electric force is that it is very small, about ten-millionths of a volt per degree, so that a small accidental disturbance may produce a serious error with a difference of temperature of only 1° between the junctions. The chief uncertainty in applying this method appears to be due to variations of temperature at different points of the surface, due to inequalities in the heating or cooling effect of the stream of water flowing over the surfaces. Uniformity of temperature could only be secured by using a high velocity of flow, or violent stirring. Neither of these methods could be applied in this experiment. The temperatures indicated by the different pairs of wires differed by as much as 10%, but the mean of the whole would probably give a fair average. The heat transmitted was measured by observing the flow of water (about 20 gm./sec.) and the rise of temperature (about 0.5°C.) of one of the streams. The results appear to be entitled to considerable weight on account of the directness of the method and the full consideration of possible errors. They were as follows:

<table>
<thead>
<tr>
<th>Cast-iron, k = 0.1490 C.G.S. at 30°C, temp. coef. = 0.00075.</th>
<th>Pure iron, k = 0.1530 at 30°C, temp. coef. = 0.0003.</th>
</tr>
</thead>
</table>

The disks were 10 cms. in diam., and nearly 2 cms. thick, plated with copper to a thickness of 2 mm. The cast-iron contained about 3.5% of carbon, 0.6% of silicon, and 1.1% of sulfur. The iron should be observed, however, that he obtained a much lower value for cast-iron, namely -105, by J. D. Forbes' method, which agrees better with the results given in § 10 below.

**Table 1** - Thermal Conductivity of Forbes' Iron Bar D (1-25 inches square), C.G.S. Units.

The variation of c is uncertain. The values credited to Forbes are those given by J. D. Everett on Balfour Stewart's authority. Tait gives different figures. The values given in the column headed "cooled" are those found by Mitchell with one end of the bar cooled. The discrepancies are chiefly due to the error of the fundamental assumption that the rate of cooling of the bar is that of the temperature under the very different conditions existing in the two parts of the experiment. They are also partly caused by the large uncertainties of the corrections, especially those of the mercury thermometers. The results of Forbes are interesting historically as having been the first approximately correct determinations of conductivity in absolute value. The same method was applied by R. W. Stewart (Phil. Trans., 1897), with a substitution of thermo-couples (following Wiedemann) for mercury thermometers. This avoids the very uncertain correction for stem-exposure, but it is doubtful how far...
an insulated couple, inserted in a hole in the bar, may be trusted to attain the true temperature. The other uncertainties of the method remain. R. W. Stewart found for pure iron, \( k = 175 \) (\( 1 - 0.015 ^{\circ} \)) C.G.S. E. H. Hall using a similar method found for cast-iron at \( k = 175 \) C. the value +0.5, but considers the method very uncertain as ordinarily practised.

10. Calorimetric Bar Method.—To avoid the uncertainties of surface loss of heat, it is necessary to reduce it to the rank of a small correction in the large bar and protecting it from loss of heat. The heat transmitted should be measured calorimetrically, and not in terms of the uncertain emissivity. The apparatus shown in fig. 2 was constructed by Callender and Nicolson with this object. Such was a special sample of cast-iron, the conductivity of which was required for some experiments on the condensation of steam (Proc. Inst. C.E., 1890). It had a diameter of 4 in., and a length of 4 ft. between the heater and the calorimeter. The emissivity was reduced to one-quarter by lagging the bar like a steam-pipe to a thickness of 1 in. The heating vessel could be maintained at a steady temperature by high-pressure steam. The other end was maintained at a temperature near that of the air by a steady stream of water flowing through a well-lagged vessel surrounding the bar. The heat transmitted was measured by observing the difference of temperature between the inflow and the outflow, and the weight of water which passed in a given time. The gradient near the entrance to the calorimeter was deduced from observations with five thermometers at suitable intervals along the bar. The results obtained by this method at a temperature of \( 40 \)\(^{\circ} \)C. varied from \( \cdot 16 \) to \( \cdot 18 \) C.G.S. from observations on different days, and were probably more accurate than those obtained by the cylinder method. The same apparatus was employed in another series of experiments by A. J. Angström’s method described below.

11. Guard-King Method.—This may be regarded as a variety of the plate method, but is more particularly applicable to good conductors, which require the use of a thick plate, so that the temperature of the metal may be observed at different points inside it. A. Berget (Journ. Phys. v. p. 503, 1888) applied the method directly to mercury, and determined the conductivity of some other metals by comparison with mercury. In the case of mercury he employed a column in a glass tube 13 mm. in diam. surrounded by a glass cylinder of the same height, but 6 to 12 cm. in diam. The mean section of the inner column was carefully determined by weighing, and found to be \( 1.403 \text{ sq. cm.} \) The top of the mercury was heated by steam, the lower end rested on an iron plate cooled by ice. The temperature of the meniscus was measured by iron wires forming thermo-junctions with the mercury in the inner tube. The heat-flow through the central column amounted to about 7.5 calories in 54 seconds, and was measured by continuing the tube through the iron plate into the bulb of a Bunsen ice calorimeter, and observing with a chronometer to a second the time taken by the mercury to contract through a given number of divisions. The calorimeter tube was calibrated by a thread of mercury weighing 19 mg., which occupied eighty-five divisions, the difference corresponding to the melting of 1 gramme of ice was assumed to be \( 0.006 \) c.c., and was taken as being equivalent to 79 calories (1 calorie = 15.59 mgm. mercury). The chief uncertainty of this method is the variation which the heat that is collected, which probably exceeds that of the central column, owing to the disturbance of the linear flow by the projecting bulb of the calorimeter. This would tend to make the value too high, as may be inferred from the following results—

Mercury, \( k = 0.001025 \) C.G.S. Berget.

\[ k = 0.001470 \] Weber.

\[ k = 0.00177 \] Angström.

12. Variable-Flow Methods.—In these methods the flow of heat is deduced from observations of the rate of change of temperature with time in a body exposed to known external or boundary conditions. No calorimetric observations are required, but the results are obtained in terms of the thermal capacity of unit volume \( c \), and the measurements give the diffusivity

flow of heat. As in the case of steady-flow methods, for far the simplest example to consider is that of the linear flow of heat in an infinite solid, which is most nearly realized in nature in the propagation of temperature waves in the soil of the surface. One of the best methods of studying the flow of heat in this case is to draw a series of curves showing the variations of temperature with depth in the soil for a series of consecutive days. The curves given in fig. 3 were obtained from the readings of a number of platinum thermometers buried in undisturbed soil in horizontal positions at McGill College, Montreal.

The method of deducing the diffusivity from these curves is as follows:—The total quantity of heat absorbed by the soil per unit area of surface between any two dates, and any two depths, \( x \) and \( x' \), is equal to \( c \) times the area included between the corresponding curves. This can be measured graphically without any knowledge of the law of variation of surface temperature, or of the laws of propagation of heat waves. The quantity of heat absorbed by the stratum \( (x \rightarrow x') \) in the interval considered can also be expressed in terms of the calorimetric conductivity \( k \). The heat transmitted through the plane \( x \) is equal per unit area of surface to the product of \( k \) by the mean temperature gradient \( (T - T') \) and the interval of time, \( T - T' \). The mean temperature gradient is found by plotting the curves for each day from the daily observations. The heat absorbed is the difference of the quantities transmitted through the bounding planes of the stratum. We thus obtain the simple equation

\[ k (\frac{dV}{dx}) - k (\frac{dV}{dx'}) = (area \ between \ curves) \ (T - T'), \]

(4)

by means of which the average value of the diffusivity \( k/c \) can be obtained for any convenient interval of time, at different seasons of the year, in different states of the soil.

For the particular soil in question it was found that the diffusivity varied enormously with the degree of moisture, falling as low as \( 0.010 \) C.G.S. in the winter for the surface layers, which became extremely dry under the protection of the frozen ice and snow from December to March, but rising to an average of \( 0.060 \) to \( 0.070 \) in the spring and autumn. The greater part of the diffusion of heat was certainly due to the percolation of water. On some occasions, owing to the sudden melting of a surface layer of ice and snow, a large quantity of cold water, percolating rapidly, gave for a short time values of the diffusivity as high as \( 0.300 \). Excluding these exceptional cases, however, the variations of the diffusivity appeared to follow the variations of the seasons with considerable regularity in successive years. The presence of water in the soil always increased the value of \( k/c \) and, as it necessarily increased \( c \), the increase of \( k \) must have been greater than that of \( k/c \).

13. Periodic Flow of Heat.—The above method is perfectly general, and can be applied in any case in which the requisite observations can be taken. A case of special interest and importance is that in which the flow is periodic. The general characteristics of such flow are illustrated in fig. 4, showing the propagation of temperature waves due to diurnal variations in the temperature of the surface. The daily range of temperature of the air and of the surface of the soil was about \( 20 \)\(^{\circ} \) F. On a sunny day, the temperature reached a maximum about 2 p.m. and a minimum about 5 a.m. As the waves were propagated downwards through the soil the amplitude rapidly
CONDUCTION

894

CONDUCTION OF HEAT

diminished, so that at a depth of only 4 in, it was already reduced to about 6°F, and to less than 2° at 10 in. At the same time, the period of maximum or minimum was retarded, about 4 hours at 4 in., and nearly 12 hours at 10 in., where the maximum temperature was reached between 1 and 2 A.M. The form of the wave was also changed. At 4 in. the rise was steeper than the fall, at 10 in. the reverse was the case. This is due to the fact that the components of shorter period are more rapidly propagated. For instance, the velocity of propagation of a wave having a period of a day is nearly twenty times as great as that of a wave with a period of one year; but on the other hand the penetration of the diurnal wave is nearly twenty times less, and the shorter waves die out more rapidly.

14. A Simple-Harmonic or Sine Wave is the only kind which is propagated without change of form. In treating mathematically the propagation of other kinds of waves, it is necessary to analyze them into their simple-harmonic components, which may be treated as being propagated independently. To illustrate the main features of the calculation, we may suppose that the surface is subject to a simple harmonic cycle of temperature variation, so that the temperature at any time t is given by an equation of the form—

\[ \theta(t) = \theta_0 + A \sin(2\pi t/T) \]

(5)

where \( \theta_0 \) is the mean temperature of the surface, \( A \) the amplitude of the cycle, \( n \) the frequency, and \( T \) the period. In this simple case the temperature cycle at a depth \( x \) is a precisely similar curve of the same period, but with the amplitude reduced in the proportion \( e^{-\alpha x} \), and the phase retarded by the fraction \( \alpha x/2 \pi \) of a cycle. The index-coefficient \( m \) is \( \sqrt{\alpha/\omega} \). The wave at a depth \( x \) is represented analytically by the equation

\[ \theta(t) = \theta_0 + A e^{-\alpha x} \sin(2\pi t/T - \alpha x). \]

(6)

A strictly periodic oscillation of this kind occurs in the working of a steam engine, in which the walls of the cylinder are exposed to regular fluctuations of temperature with the admission and release of steam. The waves in fig. 5 are drawn for particular cases, but they apply equally to the propagation of a simple-harmonic wave of any period in any substance changing only the scale on which they are drawn. The dotted boundary curves have the equation \( \theta = \theta_0 \), and show the rate of diminution of the amplitude of the temperature oscillation with depth in the metal. The wave-length in fig. 4 is 0.60 in., at which depth the amplitude of the variation is reduced to less than one five-hundredth part \( \alpha x \) of that at the surface, so that for all practical purposes the oscillation may be neglected beyond one wave-length. At half a wave-length the amplitude is only \( 1/\sqrt{2} \) of that at the surface. The wave-length in any case is \( 2\pi/\alpha \).

The diffusivity can be deduced from observations at different depths \( x \) and \( x' \), by observing the ratio of the amplitudes, which is \( e^{\alpha(x'-x)} \) for a simple-harmonic wave. The values obtained in this way for waves having a period of one second and a wave-length of half an inch agreed very well with those obtained in the same case by Angström’s method (see below), with waves having a period of 1 hour and a length of 30 in. This agreement was a very satisfactory test of the accuracy of the fundamental law of conduction, as the gradients and periods varied so widely in the two cases.

15. Annual Variation.—A similar method has frequently been applied to the study of variations of soil-temperatures by harmonic analysis of the annual waves. But the theory is not strictly applicable, as the phenomena are not accurately periodic, and the state of the soil is continually varying, and differs at different depths, particularly in regard to its degree of wetness. An additional difficulty arises in the case of observations made with long mercury thermometers buried in vertical holes, that the correction for the expansion of the liquid in the long stems is uncertain, and that the holes may serve as channels for percolation, and thus lead to exceptionally high values. The last error is best avoided by employing platinum thermometers buried horizontally. In any case results deduced from the annual wave must be expected to vary in different years according to the distribution of the rainfall, as the values represent averages depending chiefly on the diffusion of heat by percolating water. For this reason observations at different depths in the same locality often give very concordant results for the same period, as the total percolation and the average rate are necessarily nearly the same for the various strata, although the actual degree of wetness of each may vary considerably. The following are a few typical values for sand or gravel deduced from the annual wave in different localities:

The low value at Montreal is chiefly due to the absence of percolation during the winter. A. A. Rambaut’s results were obtained with similar instruments similarly located, but he did not investigate the seasonal variations of diffusivity, or the effect of percolation. It is probable that the coarser soils, permitting more rapid percolation, would generally give higher results. In any case, it is evident that the transmission of heat by percolation would be much greater in porous soils and in the upper layers of the earth’s crust than in the lower strata or in solid rocks. It is probable for this reason that the average conductivity of the earth’s crust, as deduced from surface observations, is too large; and that estimates of the age of the earth based on such measurements are too low, and require to be raised; they would thereby be brought into better agreement with the conclusions of geologists derived from other lines of argument.

16. Angström’s Method consists in observing the propagation of heat waves in a bar, and is probably the most accurate method for
measuring the diffusivity of a metal, since the conditions may be widely varied and the correction for external loss of heat can be made comparatively small. Owing, however, to the laborious nature of the observations and reductions, the method does not appear to have been seriously adopted since its first invention, except in one solitary instance by the writer to the case of cast-iron (fig. 2). The equation of the method is the same as that for the linear flow with the addition of a small term representing the radiation loss.

The heat per second gained by a current through the length of the heater @ is equal to the sum of the conduction $k \partial^2 T/\partial x^2$ and cross section q, at a point where the gradient is $\partial T/\partial x$, may be written $q(\partial^2 T/\partial x^2 + k/\partial x)$. This is equal to the product of the thermal capacity of the element, $c_d T$, by the rate of rise of temperature $\partial T/\partial t$, together with the heat per second at the extremities of the heater, which, when $T$ is limited to the perimeter of the bar, and $h$ the heat loss per second per degree excess of temperature $\theta$ above the surrounding medium. We thus obtain the differential equation

$$q(\partial^2 T/\partial x^2 + k/\partial x) = c_d T \frac{\partial T}{\partial t} + h\theta,$$

which is satisfied by the type $T = e^{at} \sin bx + c + d$. Where $a^2 h = c/dq$, and $ab = cnc/k$.

The rate of diminution of amplitude expressed by the coefficient $a$ in the index of the exponential is here greater than the coefficient $b$ expressing the retardation of phase by a small term depending on $c/k$.

$$e^{-\frac{c}{\sqrt{k}} t} \sin bx.$$
CONE

896

with temperature. In this case the solution of the equation reduces to the form

$$\theta = x(l-x)Cr_0/2lkh.$$  \hspace{1cm} (9)

By a property of the parabola, the mean temperature is $\frac{3}{4}l$ of the maximum temperature, we have therefore

$$R_0/\Delta R_0 = ICr/12kh,$$  \hspace{1cm} (10)

which gives the conductivity directly in terms of the quantities actually observed. If the dimensions of the bar are suitably chosen, the distribution of temperature is always very nearly parabolic, so that it is not necessary to determine the value of the critical current $C = \frac{3}{4}kR_0/\Delta R_0$ very accurately, as the correction for external loss is small. Where unusual accuracy is required in measuring the small change of resistance accurately, and of avoiding errors from accidental thermo-electric effects. In addition to the simple measurements of the conductivity (McGill College, 1895--1996), we have observed experiments made by King (Phil. Acad., June 1898) on the temperature distribution in the case of long bars with a view to measuring the Thomson effect. Duncan (McGill College Reports, 1899), using the simple method under King's supervision, found the conductivity of very pure copper to be 1\,007 for a temperature of 33°C.

(b) The method of Kohlrausch, as carried out by Jaeger and Dieschelort (Berlin Acad., July 1899), consists in observing the difference of temperature between the ends of the bar and the mean temperature, which is directly a function of temperature. The external heat-loss was estimated by measuring the temperature of the jacket surrounding the bar, and applying a suitable correction to the observed difference of temperature. But the method (a) previously described appears to be preferable in this respect, since it is better to keep the jacket at the same temperature as the cold-block. Moreover, the variation of thermal conductivity with temperature is small and uncertain, whereas the variation of electrical conductivity is large and can be accurately determined, and may therefore be legitimately utilized for eliminating the external heat-loss.

From a comparison of this work with that of Lorenz, it is evident that the conductivity of the specimens investigated varies with the purity of the material, and cannot be safely applied to other specimens than for which they were found.

19. Conduction in Gases and Liquids.—The theory of conduction of heat by diffusion in gases has a particular interest, since it is possible to predict the value on certain assumptions, if the viscosity is known. On the kinetic theory the molecules of a gas are relatively far apart and there is nothing analogous to friction between two adjacent layers A and B moving with different velocities. There is, however, a continual interchange of molecules between A and B, which produces the same effect as viscosity in a liquid. Faster-moving particles diffusing from A to B carry their momentum with them, and tend to accelerate B; an equal number of slower particles diffusing from B to A act as a drag on A. This action and reaction between layers in relative motion is equivalent to a frictional stress tending to equalize the velocities of adjacent layers. The magnitude of the stress per unit area parallel to the direction of flow is evidently proportional to the velocity gradient, or the rate of change of velocity per cm. in passing through each layer to the next. It must also depend on the rate of interchange of momentum; that is to say, on the number of molecules passing through each square centimetre per second in either direction, (2) on the average distance to which each can travel before collision (i.e. on the "mean free path"), and (3) on the average velocity of translation of the molecules, which varies as the square root of the temperature. Similarly if A is hotter than B, or if there is a gradient of temperature between adjacent layers, the diffusion of molecules from A to B tends to equalize the temperatures, or to conduct heat through the gas at a rate proportional to the temperature gradient, and depending also on the rate of interchange of molecules in the same way as the viscosity effect. Conductivity and viscosity in a gas should vary in a similar manner since each depends on diffusion in a similar way. The mechanism is the same, but in one case we have diffusion of momentum, in the other case diffusion of heat.

Viscosity in a gas was first studied theoretically from this point of view by J. Clerk Maxwell, who predicted that the effect should be independent of the density within wide limits. This, at first sight, paradoxical result is explained by the fact that the mean free path of each molecule increases in the same proportion as the density is diminished, so that as the number of molecules crossing each square centimetre decreases, the distance to which each carries its momentum increases, and the total transfer of momentum is unaffected by variation of density. Maxwell himself verified this prediction experimentally for viscosity over a wide range of pressure. By similar reasoning the thermal conductivity of a gas should be independent of the density. This was verified by A. Kundt and E. Warburg (Journ. Phys. v. 118), who found that the rate of cooling of a thermometer in air between 150 mm. and 1 mm. pressure remained constant as the pressure was varied. At higher pressures the effect of conduction was masked by convection currents. The question of the variation of conductivity with temperature is more difficult. If the effects of pressure and velocity which vary with the composition of the molecules, both conductivity and viscosity should increase directly as the square root of the absolute temperature; but the mean free path also varies in a manner which cannot be predicted by theory and which appears to be different for different gases (Rayleigh, Proc. R.S., January 1896). Experiments by the capillary tube method have shown that the viscosity varies more nearly as $\theta^2$, but indicate that the rate of increase diminishes at high temperatures. The conductivity probably changes with temperature in the same way, being proportional to the product of the viscosity and the specific heat; but the experimental investigation presents difficulties on account of the necessity of eliminating the effects of radiation and convection, and the results of different observers often differ considerably from theory and from each other. The values found for the conductivity of air at 0°C. range from -00048 to -00057, and the temperature coefficient from -0015 to -0028. The results are consistent with theory within the limits of experimental error, but the experimental methods certainly appear to admit of improvement.

The conductivity and viscosity of gases are both proportional to the square root of a certain coefficient which can be expressed by a number of products of the constants of the material, and can by experiments be determined by a number of similar methods, generally variations of the thin plate or guard-ring method. A critical account of the subject is contained in a paper by C. Chree (Phil. Mag., July 1887). Many of the experiments were made by comparative methods, taking a standard liquid such as water for reference. A determination of the conductivity of water by S. R. Milner and A. P. Chattock, employing an electrical method, deserves mention on account of the careful elimination of various errors (Phil. Mag., July 1896). Their final result was $k = -001433$ at 20°C, which may be compared with the results of other observers, G. Lundquist (1889), -00155 at 40°C; A. Winklemann (1874), -00104 at 15°C; H. F. Weber (corrected by H. Loberg), -00138 at 4°C, and -00152 at 23°C; C. H. Lees (Phil. Trans., 1898), -00136 at 25°C, and -00120 at 47°C; C. Chree, -00124 at 18°C, and -00136 at 19.5°C. The variation of these results illustrates the experimental difficulties. It appears probable that the conductivity of a liquid increases considerably with rise of temperature, although the true curve would appear from the work of Lees. A large mass of material has been collected, but the relations are obscured by experimental errors.

CONE (Gr. κώνος), in geometry, a surface generated by a line (the generator) which always passes through a fixed point (the vertex) and through the circumference of a fixed curve (the directrix). The two sheets of the surface, on opposite sides of the vertex, are called the "nappes" of the cone. The solid formed between the vertex and a plane cutting the surface is also called a "cone"; this is contained by a conical surface and the plane of section. Euclid defines a "right cone" as the
solid figure formed by the revolution of a right-angled triangle about one of the sides containing the right angle. The axis of the cone is the side about which the triangle revolves; the circle traced by the other side containing the right angle is the "base"; the hypotenuse in any one of its positions is a generator or generating line; and the intersection of the axis and a generator is termed the vertex. The Euclidean definition may be modified, so as to avoid the limits thereby placed on the figure, viz. the notion that the solid is between the vertex and the base. A general definition is as follows:—If two intersecting straight lines be given, and one of the lines is made to revolve about the other, which is fixed in such a manner that the angle between the lines is everywhere the same, then the surface (or solid) traced out by the moving line (or generator) is a cone, having the fixed line for axis, the point of intersection of the lines for vertex, and the angle between the lines for the semi-vertical angle of the cone.

An "oblique cone" is the solid or surface traced out by a line which passes through a fixed point and through the circumference of a circle, the fixed point not being on the line through the centre of the circle perpendicular to its plane. A "quadric cone" is a cone having any conic for its base. The plane containing the vertex, centre of the base, and perpendicular to the base is called the principal section; and the section of a cone by a plane containing the vertex is a triangle if the solid be considered, and two intersecting lines if the surface be considered. The "subcontrary section" of an oblique cone is made by a plane not parallel to the base, but perpendicular to the principal section, and inclined to the generating lines in that section at the same angles as the base; this section is a circle. The planes parallel to the base or subcontrary section are called "cyclic planes."

The Greeks distinguished three types of right cones, named "acute," "right-angled," and "obtuse," according to the magnitude of the vertical angle; and Menaechmus showed that the sections of these cones by planes perpendicular to a generator were the ellipse, parabola and hyperbola respectively. Apollonius went further when he derived these curves by varying the inclination of the section of any right or oblique cone (see CONIC SECTION). It is to be noted that the Greeks investigated these curves in solido, and consequently the geometry of the cone received much attention. The mensuration of the cone was established by Archimedes. He showed that the volume of the cone was one-third of that of the circumscribing cylinder, and that this was true for any type of cone. Therefore the volume is one-third of the product area of base x vertical height. The surface of a right circular cone is equal to one-half of the circumference of the base multiplied by the slant height of the cone.

Analytically, the equation of a right cone formed by the revolution of the line $y = mx$ about the axis of $x$ is $z = mz(x^2+y^2)$. Obviously every tangent plane passes through the vertex; this is the characteristic property of conical surfaces. Conical surfaces are also "developable" surfaces, i.e. the surface can be cut out to a plane without wrenching or bending. Connected with quadric cones is the interesting curve termed the "sphericonic," which is the curve of intersection of any quadric cone and a sphere having its centre at the vertex of the cone.

References should be made to the articles GEOMETRY and SURFACE for further discussion; and to the bibliographies of these articles for sources where the subject can be further studied. The geometry of the construction of the curve of intersection of the cone with other solids is given in treatises on descriptive solid geometry, e.g. T. H. Eagles, Constructive Geometry.

CONECTE, THOMAS (d. 1434), French Carmelite monk and preacher, was born at Rennes. He travelled through Flanders and Picardy, denouncing the vices of the clergy and the extravagant dress of the women, especially their lofty head-dresses, or hennins. He ventured to teach that he who is a true servant of God need fear no papal curse, that the Roman hierarchy is corrupt, and that marriage is permissible to the clergy, of whom only some have the gift of continence. He was listened to by immense congregations, and in Italy, despite the opposition of Nicolas Kenion (d. 1468), provincial of the English Carmelites, he introduced several changes into the rules of that order. He was finally apprehended by order of Pope Eugenius IV., condemned and burnt for heresy.

An account of Friar Thomas's preaching and its effect is given by Enguerrand de Monstrelet, provost of Cambrai (d. 1453), in his continuation of Froissart's chronicles.

CONEGLIANO, a town and episcopal see of Venetia, Italy, in the province of Treviso, 17 m. N. by rail from the town of Treviso, 230 ft. above sea-level. Pop. (1901) town, 5880; commune, 10,252. It is commanded by a large castle. It was the birthplace of the painter Cima da Conegliano, a fine art-piece by whom is in the cathedral (1492). The place is noted for its wine, chiefly sweet champagne.

CONESTOGA (said to mean "people of the immersed or forked poles"), a tribe of North American Indians of Iroquoian stock. Their country was Pennsylvania and Maryland on the lower Susquehanna river and at the head of Chesapeake bay. They were formerly known as Susquehannas. They were formerly a powerful people, able to resist the attacks of the Iroquois. In 1675, however, they were defeated and scattered by the New Englanders. At the beginning of the eighteenth century the tribe was reduced to a few families and the remnants lived in South Carolina.

CONEY ISLAND, an island about 9 m. S.E. of the S. end of Manhattan Island, U.S.A., on the S. shore of Long Island, from which it is separated by Gravesend Bay, Sheephead Bay, Coney Island Creek, a tidal inlet, and a broad stretch of low salt marshes. It lies within the limits of the Borough of Brooklyn, New York city. The island is the westernmost of a chain of outlying sandbars that extends along the southern shore of Long Island for almost 100 m.; it is about 5 m. long and varies from $\frac{1}{3}$ m. to 1 m. in width. It is served by the Long Island railway, by several lines of electric railway, and (in summer) by steamboat lines. The island is the most popular sea resort of the United States. There are four quite distinctly marked districts. At the extreme western extremity, Nortons's Point, is the district known as Sea Gate, lying between Gravesen Bay and Lower York Bay. In addition to the above, there is a fine beach-house, a large number of summer homes and the handsome club-house of the Atlantic Yacht Club. A broad shore drive connects it on the E. with West Brighton, the most popular amusement centre, to which the name Coney Island has come to be more especially applied. It has many scenic and spectacular features, "side-shows," booths, cafés and dancing halls, have made "Coney Island" a well-known resort. There are bathing beaches, two immense iron piers, observation towers, scenic railways, "Ferris" wheels, and the two amusement reservations known as "Luna Park" and "Dreamland." From West Brighton a broad parkway known as "the Concourse" connects with Brighton Beach, 2 m. to the E., passing the large bathing establishments maintained by the city of New York. At Brighton Beach there are a large hotel, a theatre and the Brighton Race Track. Still farther to the E., and extending to the eastern extremity of the island, lies Manhattan Beach, with hotels, a theatre and baths, and patronized more largely by a wealthier class of visitors. Adjacent to Manhattan Beach on the mainland, and separated from it by a narrow neck of Sheephead Bay, lies the village of Sheephead Bay, in which is the famous race track of the Coney Island Jockey Club.

CONFALONIERI, FEDERICO, COUNT (1783-1846), Italian revolutionist, was born at Milan, descended from a noble Lombard family. In 1806 he married Teresa Casati. During the Napoleonic period Confalonieri was among the opponents of the French régime, and was regarded as one of the leaders of the Italiani poveri, or Italian national party. At the time of the Milan riots of 1814, when the minister Prina was assassinated, Confalonieri was unjustly accused of complicity in the deed. After the fall of Napoleon he went to Paris with the other Lombard delegates to plead his country's cause, advocating the formation of a separate Lombard state under an independent prince. But he received no encouragement, for Lombardy was destined for Austria, and Lord Castlereagh counseled him by
saying that "the Austrian government was the most beneficent in the world." Confloneri went on to London, in the hope of winning the favors of the Brit's government, but failed in his object. He then joined the freemasons and some of the various other secret societies with which all Europe was swarming, being initiated by Filippo Buonarroti (1761-1837), an old Tuscan Jacobin living in Paris. On returning to Milan, where he found the Austrians in possession, he at first devoted himself to promoting the material progress of his country, but he was ever watching for an opportunity to liberate it from the foreigner.

Early in 1821, when the atmosphere was thick with rumours of revolt, he visited various parts of Italy to sound the liberal leaders, and also corresponded with the Piedmontese officers who, believing that they had the approval of Prince Charles Albert of Carignano, the heir to the throne, were planning a military revolt. There was talk of a rising at Milan combined with a Piedmontese invasion to expel the Austrians, but the plans were very vague and unpractical, for the military conspirators could count only on a few hundred men, and Confloneri warned them that Lombardy was not ready. On the outbreak of the Piedmontese revolt (March-April 1821) the Austrian authorities made some arrests, and, through the treachery of one conspirator and the firmness of others, discovered the plot, if it could so be called, and arrested Silvio Pellico and Maroncelli and afterwards Confloneri. A long trial now began, conducted with all the rigour and secrecy of the Austrian procedure, and Confloneri, outwitted by the astute examining magistrate, A. Salvotti (d. 1866), contradicted himself, made fatal admissions, even compromised others, and together with several companions was condemned to death for high treason, but through the intercession of his wife and father, who went to Vienna to plead his cause in person, the emperor Francis commuted the penalty to perpetual imprisonment in the fortress of Spielberg (January 1824). Confloneri was taken to Vienna and had a long interview with Prince Metternich, who tried to extract further confessions incriminating other persons, especially Charles Albert, but although Confloneri seemed at one time inclined to prepare a report on the revolutionary movement for the emperor, he did not do so, and once he was in prison he refused to say or write another word, and was treated with perpetual severity in consequence. His wife died in 1830, and in 1836, on the death of the emperor Francis, he was pardoned and exiled to America. He came back to Europe after a year's absence, and in 1840 obtained permission to return to Milan to see his dying father. He himself, broken in health and spirits, died on the 10th of December 1846, too soon to see the accomplishment of Italian freedom. He had undoubtedly played a considerable rôle in the conspiracy of 1821, being the most influential and richest of the Milanese Liberals; when first arrested his conduct may have been open to criticism, but he more than expiated any temporary weakness due to ill-health and to the barbarous methods of examination by his heroic attitude during his long imprisonment, and his persistent refusal to accept offers of pardon accompanied by dishonouring conditions.

His Memoire e Lettere have been edited by Gabrio Casati (2 vols., Milan, 1890). A. D'Areco's Fedugo Confloneri (Milan, 1868) is based on the memoirs and on a large number of secret documents from the archives of Vienna and Milan. A. Luzio's Antonio Salvotti e i processi del Ventuno (Rome, 1901) contains many fresh documents which to some extent exonerate Salvotti from the charge of cruelty; among other papers Metternich's interview with Confloneri is given in full. See also A. Luzio, Nuovi documenti sul processo Confloneri (Rome, 1908). *(L. V.*)

**CONFARREATIO**—CONFECTIONERY

**CONFARREATIO**, the ancient patrician form of marriage among the Romans, especially necessary at the nuptials of those whose children were intended to be vestal virgins or flamens of Jupiter. The name originated in the bride and bridgroom sharing a cake of spelt (*far or panis forreus*), in the presence of the pontifex maximus, *flamen dialis*, and ten witnesses. This form of marriage could only be dissolved by another equally solemn ceremony, which was called *diffarreatio*. In later republican times, confarreatio became obsolete except in the case of the most sacred priest-hoods—the *flamines* and the *rex sacrorum*. Confarreatio was the most solemn of the three forms of marriage (*q.s.*), but in later times the ceremony fell into disuse, and Cicero mentions but two, *completo* and *usus*. (See Roman Law.)

**CONFECTIONERY** (from Lat. *confectio, confecere*, compound), a term of rather vague application, embracing all food preparations of the nature of sweetmeats, pastry, &c., which have sugar (*q.s.*) for their basis or principal ingredient. In this way the industry may be said to include the preservation of fruits by means of sugar, the manufacture of jams and jellies, the art of preparing fruit-syrups and pastes, ices, and sweetened beverages, in addition to the various manufactures in which sugar is the more prominent and principal ingredient. In former days the making of sweetmeats was part of a druggist's business, but in the earlier half of the 19th century it developed into a separate industry in England, and the International Exhibition of 1851 resulted in its spreading to other countries. At the present day France and Germany are prominent in all sorts of confectionery and bon-bons; and the "candy" industry in America has developed enormously.

The simplest form of candy which sugar is prepared as a sweet for eating is that of *laenges*, which consist of finely ground sugar mixed with dissolved gum to form a stiff dough. This is rolled into sheets of the desired thickness from which the lozenges are stamped out by appropriate cutters and then allowed to dry and harden in a heated apartment. They are coloured and flavoured with a great variety of ingredients, which are added in suitable proportions with the dissolved gum. Many kinds of medicated lozenges are also in extensive use, the medicinal ingredients being similarly incorporated with the gum. Hard sweetmeats, *comfits* or *dragles*, constitute another important variety of confectionery. To make these a core or centre of some kind is taken, consisting of a small lozenge, or of some seed or fruit, such as an almond, corander, caraway, pistachio, &c., and successive layers of sugar are deposited around it till the desired size is attained. The cores are placed in large copper pans or vessels which are heated by a steam coil or jacket, or by hot air, and which are geared to rotate at an inclined angle so that their contents are kept constantly in motion, tumbling over each other until the sugar syrup is reduced to the right consistency. The sugar syrup is then passed through a filter and poured inlayers until the desired coating is obtained. The thin set of alternate coatings in the pan and dryings, the comfits are finished with a coating of thin syrup, which may be coloured if desired. Another extensive class of confectionery is made with sugar boiled at different temperatures, the various degrees of heating being known as *three*, *grow* or *feather*, *brown* or *burn* or *crack*, *caramel*, &c. In some cases a little cream of tartar, or glucose to the extent of 30% or even more, is used with the sugar. By treatment of this kind the sugar is obtained in a wide range of consistencies, from soft and creamy, as in *fondants*, to clear and hard, as in *barley sugar*. By vigorous and continued drawing out or "pulling" of boiled sugar while it is in a plastic condition, the molecular structure of the material is changed, and from being glassy and transparent it becomes opaque, porous and granular in appearance. In this way the preparation known as *rock* is manufactured. For *liqueurs*, a flavoured syrup is dropped into moulds impressed in dry starch, when a crust of sugar forms on the outside, the interior remaining liquid. The thickness of this crust is then increased by immersion in syrup, from which more sugar-crystals are deposited upon it, and the sweets may be finished in the comfit-pan already mentioned. *Sugar-candy* is prepared from solutions of either brown or refined sugar, to the latter of which cochineal or other colouring ingredient is frequently added. The solutions, when boiled to a proper degree, are poured into moulds across which pieces of string are stretched at sufficient intervals. Kept in a chamber heated from 90° to 100° F., the sugar gradually crystallizes on the strings and the sides of the mould, and when sufficient has been deposited the remaining liquor is drained off, and the crystals are removed and dried by heat. Machinery, often of
elaborate character, is now extensively employed in almost all branches of the confectionery trade. For chocolate see that article also in Cocoa.

CONFEDERATE STATES OF AMERICA, the title of the independent government, formed by the seceding Southern States at the opening of the American Civil War, in the winter of 1860–1861. These States contained roughly half the population of the Northern States which remained in the Union. In proportion to their population they had played a more important part in the previous political history of the United States than was their share. The formation of the new Confederacy was in the hands of experienced statesmen, well schooled in the politics of their respective states and in the halls of the Federal Congress to undertake such a task. Jefferson Davis of Mississippi was almost naturally chosen president, his rival candidates being Alexander H. Stephens, subsequently chosen to fill the vice-presidency of the Confederacy, an important exponent of states' rights, and during the war a strong antagonist of President Davis's policy, and Robert Toombs of Georgia, a strong secessionist. The latter became a prominent member of the Confederate Congress, and, like Stephens, opposed the despotic powers of the Richmond government. President Davis had been trained in the Federal army, as well as in the Congress and in the National administration. His administration of the Confederate presidency cannot be called brilliant. The difficulties he contended with, however, were insurmountable; but his official acts were always the result of an unselfish desire to do what seemed best for the cause he espoused. The president's cabinet contained, among others, Judah P. Benjamin, secretary of state; C. G. Memminger (1803–1888), and later George A. Trenholm (1806–1876), secretaries of the treasury; G. W. Randolph (1818–1878) and James A. Seddon (1815–1880), secretaries of war; S. R. Mallory (1813–1873), secretary of the navy, and John H. Reagan, postmaster-general. Of these Memminger was distinctly the most powerful intellectually. Memminger, with little training or aptitude for his difficult position, did not distinguish himself as a financier, and was succeeded in the summer of 1864 by Trenholm, a Charleston banker, of high intelligence and good training, who, however, found it impossible to save the Confederacy from financial ruin. Of other Confederates prominent in official positions the following may be mentioned: Howell Cobb, a former member of the Federal Congress and of President Buchanan's cabinet, serving as speaker of the provisional Confederate congress and later in the field; Robert W. Barnwell (1801–1882) and William L. Yancey; Benjamin H. Hill (1823–1882) and A. H. Keenan of Georgia; John A. Campbell (1811–1880), before the war a judge of the U.S. Supreme Court; Judge A. G. Magrath (1813–1863), a prominent judge of the Confederate court in South Carolina; Governors Z. B. Vance of North Carolina, and J. E. Brown of Georgia (1811–1864).

In framing their provisional and permanent constitutions in 1861 the Confederate statesmen emphasized the points of view which had characterized them in the great contest of the first half-century. They also aimed to correct certain defects in the United States Constitution by amending that document in various directions. The Southern "States' Rights" view of the sovereign and independent position of the individual states was emphasized in the Confederate constitutions, which even went so far as to allow a state legislature to impeach a Confederate official acting within that state. Moreover, in the provisional Confederate constitution state officials were not bound by oath to support the central government. The powers of the executive were increased as against the prerogatives of the congress. The president was allowed to veto particular appropriations and approve others in the same bill. His term of office was lengthened to seven years, and he was declared ineligible for a second term of office. The cabinet officers were allowed seats in either house of congress, in imitation of the practice in Great Britain, which Alexander H. Stephens especially was anxious to transplant to the American continent. The congress could appropriate money for particular purposes only by a two-thirds majority, unless the appropriation were asked for by the head of that department. Every bill was to refer to one subject, and that subject was to be expressed in the title, a provision aimed at preventing "omnibus" and confused legislation, in which it signaly failed.

The Southern attitude toward a protective tariff was emphasized by the constitutional provision that no bounty should be paid and no taxes levied for the benefit of any branches of industry. Similarly the central government could not authorize internal improvements except for aids to navigation. Also the expenses of the post office were not allowed to exceed its receipts. The old Constitution had carefully avoided the use of the word "slave," but the Confederate constitutions had no such scruples, and, moreover, recognized the legitimate existence of slavery, and forbade all legislation which might impair the right of property in negro slaves.

These changes all had reference to times of peace. The war powers of the government were left unchanged from those provided for by the Federal Constitution. Provisions of that document as to suspending the writ of habeas corpus and the provisions regarding conscription were left equally vague in the new Confederate Constitution. These led to acrimonious discussion and much bitter feeling against the centralized war powers of the government at Richmond. As the war progressed, the Richmond authorities became necessarily more and more oppressive and aroused the "States' Rights" feeling prevalent in the South. It became evident that a confederated form of government, such as was planned by the Southerners, was unsuited to the stringent requirements of war times and contributed doubtless somewhat to the final cataclysm.

The provisions of the new constitution regarding the issue of legal tender paper money remained the same as of old. In the North such legal tender paper began to be issued in the spring of 1862, and later opened the question of the constitutionality of such a practice. No Confederate legal tender act was ever passed, though the agitation in that direction was often strong. The objections which prevented the passage of such an act were the same as those offered by the minority in later years against the constitutionality of the Federal legal tender act. The Southerners were too true to their strict constructionist views of the constitution to admit the constitutionality of a legal tender act.

The personnel of the Confederate congress and administration was materially weakened by the military field's drawing off the most brilliant Southern leaders. It was largely owing to the strategical skill of these generals that the Southern armies, smaller and more poorly equipped than their opponents, maintained the unequal contest for four years. In the naval operations the North had an overwhelming advantage, which was promptly and effectively used. The blockade of the Southern ports, beginning in the spring of 1861, was much less spectacular than the operations of the army, but was quite as effective in breaking down the Confederacy. It cut off the South from obtaining foreign war supplies, and reduced it to dependence on its own resources. War industries were already in existence. Manufacturing industries hardly existed in the South. A few iron works attempted with little success to meet the demand for ordnance. This and small arms were obtained from the Federal arsenals in 1861, by capture and to some extent by eluding the blockade. Powder factories were established and vigorously operated. The scarcity and high price of clothing put a large premium on the establishment of textile factories, but their product was far below the demand.

The South was unfortunate in having a poorly developed railway system. As compared with those of the North, its railways were inadequately equipped and did not form connected systems. During the war, the inroads of the Federal troops, and the natural deterioration of the lines and their rolling stock, greatly reduced the value of the railroads as a military factor. They continued to be active in distributing the relatively small amount of imports through the blocked ports of Charleston, Savannah and Wilmington. Their usefulness to the army and
the city population in collecting food material from the country districts was much impaired.

The harvests in the South during the war were fairly abundant, as far as they were not destroyed by the advancing Northern armies. Maize was raised in large quantities, and, in general, the raising of food products instead of tobacco and cotton was encouraged by legislation and otherwise. The scarcity of food in the armies and cities was chiefly due to the breaking down of the means of transportation, and to the paper money policy and its attendant repressive measures.

The specie holdings of the Southern banks largely found their way into the Confederate treasury in payment for the $15,000,000 loan effected early in 1861. In addition, the government secured the specie in the various Federal offices which fell into its power. These sums were soon sent to Europe in payment of foreign war supplies. The gold and silver in general circulation also soon left the country almost entirely, driven out by the rising flood of paper money. Aside from the payment of the above loan, the government never secured any specie revenue, and was driven headlong into the wholesale issue of paper money. The first notes were issued in March 1861, and bore interest. They were soon followed by others, bearing no interest and payable in two years, others payable six months after issue. New issues were continually provided, so that from an initial $1,000,000 in circulation in July 1861, the amount rose to 30 millions before December 1861; to 100 millions by March 1862; to 200 millions by August 1862; to perhaps 500 millions by December 1862; to 700 millions by the autumn of 1863; and to a much larger figure before the end of the war.

This policy of issuing irredeemable paper money was copied by the individual states and other political bodies. Alabama began by issuing $1,000,000 in notes in February 1861, and added to this amount during each subsequent session of the state legislature. The other states followed suit. Cities also sought to replenish their treasuries in the same way. Corporations and other bodies in general consented to the rising tide of prices with the issue of their individual promissory notes intended to circulate from hand to hand. As a result of this redundancy of the currency the price of gold rose to great heights. It was quoted at a premium in Confederate notes in April 1861. By the end of that year a paper dollar was quoted at 90 cents in gold; during 1862 that figure fell to 40 cents; during 1863, to 6 cents; and still lower during the last two years of the war. The downward course of this figure, with occasional recoveries, reflects the popular estimate of the Confederacy’s chance of maintaining itself against the Northern invasion. The fluctuations of the gold premium in the North during the same years are a complementary movement, and correspondingly reflect the periods of popular elation and depression as to the final outcome of the war.

The redundant currency drove the price of commodities to incredible heights, and deranged all business. It affected different classes of commodities differently. Those the supply of which was entirely from abroad, like coffee, rose to the greatest height owing to their scarcity produced by the blockade. Ingenious substitutes were found for such articles, and enormous profits were secured by the merchants who successfully ran the blockade and imported such much-needed articles of foreign origin. These speculators were continually abused for making such importations instead of confining themselves to supplying the government with foreign war supplies. Articles that were produced in the South and marketed abroad in the North during normal times rose least in value. Tobacco and cotton, for instance, which found no buyers owing to the blockade, actually fell in value as quoted in gold. The great divergence of the price of these two commodities in the South and abroad—

The same motive to encourage trade with the enemy. Tobacco and cotton were smuggled through the military lines in exchange for hospital stores, coffee and similar articles. The military authorities tried to suppress this illicit trade, but at times even they were carried away by the desire to secure the much-desired foreign supplies. The civil government also hallucinated between the policy of encouraging exports, especially to Europe in exchange for foreign goods, and the policy of forbidding such trade in view of the supposed advantage accruing to foreigners, who it was hoped would be compelled to acknowledge the independence of the Confederacy in order to secure Southern cotton.

The derangement of prices, their local differences and fluctuations, produced wild speculation in the South. Normal business was almost impossible, and the gambling element was forced into every transaction. Speculation in gold was especially pronounced. Legislation and popular feeling were aimed at it, but without avail. Even the government itself was compelled to speculate in gold. Speculation in food and other articles was equally inevitable and was much decried. Laws were formed to curb the speculators, but had no effect.

The policy of the Southern banks during the war encouraged speculation. The New Orleans banks had been well managed, and remained solvent until September 1861. The banks of the other states suspended specie payments at the end of 1860, and thereafter enlarged their note issue and their loans, thereby adding to the general redundancy of the currency and stimulating the prevalent speculative craze. They did a large business by speculating in cotton, making advances to the planters on the basis of their crops. The state governments also used their note issues for this purpose, the planters urgently demanding relief as their cotton could not reach a market. The Confederate government also made advances on cotton and secured large quantities by purchase, to serve as the basis of cotton bonds. The rise of prices reflecting the redundancy of the currency was no advantage to the producer. Frequent efforts were made by legislation and otherwise to reduce the prices demanded especially by the agriculturists. As a result, the production of food products fell off, at least the agriculturists did not bring their products to market for fear of being forced to sell them at a loss. Supplies for the army were obtained by impressment, the price to be paid for them being arbitrarily fixed at a low figure. As a result, the army administration found it almost impossible to induce producers of food willingly to turn over their products, and the army suffered from want. Under these confused industrial circumstances the sufferings of the debtor class were loudly asserted, and laws were passed to relieve them of their burdens, making the collection of debts difficult or impossible. The debts of Southerners to Northerners contracted before the war were confiscated by the Confederate government, but did not amount to a large figure.

The effectiveness of the Federal blockade and the peculiar industrial development of the South removed the possibility of any heavy government import duties. The small export duty on cotton was expected to produce a large revenue sufficient to base a loan upon, but the small amount of cotton exports reduced this source of revenue to an insignificant figure. There being, moreover, no manufactures to tax under an internal revenue system such as the North adopted, the Confederacy was cut off from deriving any considerable revenue from indirect taxation. The first Confederate tax law levied a direct tax of twenty millions of dollars, which was apportioned among the states. These, with the exception of Texas, contributed their apportioned share to the central government by issuing bonds or notes, so that the tax was in reality but a disguised form of loan. Real taxation was postponed until the spring of 1863, when a stringent measure was adopted taxing property and earnings. It was slowly and with difficulty put into effect, and was re-enacted in February 1864. In the states and cities there was a strong tendency to relax or postpone taxation in view of the other demands upon the people.
CONFEDERATION—CONFERENCE

With no revenue from taxation, and with the disastrous effects of the wholesale issue of paper money before it, the Confederate government made every effort to borrow money by the issue of bonds. The initial 15-million loan was soon followed by an issue of one hundred millions in bonds, which it was, however, difficult to place. This was followed by even larger loans. The bonds rapidly fell in value, and were quoted during the war at approximately the value of the paper money, in which medium they were paid for by subscribers. To avoid this circumstance a system of produce loans was devised by which the bonds were subscribed for in cotton, tobacco and food products. This policy was subsequently enlarged, and enabled the government to secure at least a part of the armies’ food supplies. But the bulk of the subscriptions for these bonds was made in cotton, for which the planters were thus enabled to find a market.

It was hoped to keep the currency within bounds by holders of paper money exchanging it for bonds, which the law allowed and encouraged, but as notes and bonds fell in value simultaneously, there was no inducement for holders to make that exchange. On the contrary, a note-holder had an advantage over a bond-holder, in that he could use his currency for speculation or for purchases in general. In the autumn of 1862 the Confederate law attempted to compel note-holders to fund their notes in bonds, in order thereby to reduce the redundancy of the currency and lower prices. Disappointed in the result of this legislation, the Congress, in February 1864, went much farther in the same direction by passing a law requiring note-holders to fund their notes before a certain date, after which notes would be taxed a third or more of their face value. This drastic measure was accepted as meaning a partial repudiation of the Confederate debt, and though it for the time reduced the currency outstanding and lowered prices, it wrecked the government’s credit, and made it impossible to float any more loans. During the last months of the war the Treasury led a most precarious existence, and its actual operations can only be surmised.

During the entire war the notion that the South possessed a most efficient engine of war in its monopoly of cotton buoyed up the hopes of the Southerners. The government strained every effort to secure recognition of the Confederacy as a nation by the great powers of Europe. It also more successfully secured foreigners’ financial recognition of the South by effecting a foreign loan based on cotton. This favourite notion was put into practice in the spring of 1863. The French banking house of Erlanger & Company undertook to float a loan of $3,000,000, redeemable after the war in cotton at the rate of sixpence a pound. As cotton at the time was selling at nearly four times that figure and would presumably be quoted far above sixpence long after the establishment of peace, the bonds offered strong attractions to those speculatively inclined and in sympathy with the Southern cause. The placing of the bonds in Europe was mismanaged by the Confederate agents, but notwithstanding a considerable sum was secured from the public and used for the purchase of naval and military stores. At the close of the war these foreign bonds were ignored by the re-established Federal authorities like all the other bonds of the Confederate government. Compared with the partial success of this financial recognition by Europe, the South conspicuously failed in securing the political recognition of the Confederate government. Early in 1861 W. L. Yancey and others went to Europe to enlist the sympathy of foreign governments in the Southern cause. J. M. Mason and John Slidell followed early in 1862, after a short detention by the Federal government, which had removed them from a British vessel en route to Europe. Though these Confederate commissioners made every effort to induce foreign governments, especially France and Great Britain, to recognize the Confederacy, they were foiled in their efforts, largely by the skill and persistence of the Federal minister in London, Charles Francis Adams.

The political history of the Confederate States is the culmination of an inevitable conflict, the beginnings of which are found in the earlier history of the Union. The financial and industrial history of the South during 1860 to 1865 is the story of a struggle with overwhelming odds. The more the efforts of the Confederate government’s policy are overshadowed by its efforts to maintain itself against the irresistible attacks of the North. In making that effort the South sacrificed everything, and emerged from the war a financial and industrial wreck.

CONFEDERATION (Fr. confédération, Lat. confederatio, from foedus, a league, foedera, to form a league), primarily any league, or union of people, or bodies of people. The term in modern political use is generally confined to a permanent union of sovereign states, for certain common purposes, e.g. the German Confederation, (1815–1866), established by the Congress of Vienna in 1815, and the Confederation of the Rhine (Reichs bund), a league of certain German states under the protection of Napoleon (1806–1813). The alliance of the Great Powers by which Europe was governed after 1815 was sometimes, especially by the emperor Alexander I., called the “Confederation of Europe”; but this expressed rather a pious aspiration than the actual state of affairs. The distinction between Confederation and Federation (see FEDERAL GOVERNMENT), synonymous in their origin, has been developed in the political terminology of the United States. Up to 1780 these were a Confederation; then the word Federation, or Federal Republic, was introduced as implying closer union. This distinction was emphasized during the Civil War between North and South, the confederate states forming a Confederation (Confederate States of America) in opposition to the Federal Union. Confederation thus comes to mean a union of sovereign states in which the stress is laid on the sovereign independence of each constituent body (cf. the German Staatenbund); Federation implies a union of states in which the stress is laid on the supremacy of the common government (Ger. Bundestaat). The distinction is, however, by no means universally observed.

The variant “Confederacy,” derived through the AngloFrench confédéracie, and meaning generally a league or union, whether of states or individuals, was applied in America in the sense of Confederation to the seceding southern states (see above). In its political sense, however, confederacy has generally come to mean rather a temporary league of independent states for certain purposes. As applied to individuals, while “confederation” is used of certain open unions of people for political or other purposes (e.g. the Miners’ Confederation), “confederacy” — from its obsolete legal sense of conspiracy — has come frequently to imply a secret bond, a combination for illicit purposes, or union sub rosa, e.g. the Delaware Confederacy. There were at least two distinct kinds of confederacy. (1) The United States of America, 1787–1804 (Richmond, 1881); Congress of the Confederate States (Richmond, 1901); Herbert Fielder, Life of Joseph E. Brown (Springfield, Mass., 1883); J. B. Jones, Rebel War Clerk’s Diary (Philadelphia, 1866); E. McPherson, Political History of the United States (4th ed., Washington, 1882; contains many important documents); Official Records: Compilation of the War of the Rebellion (Washington, 3rd series, 1890–1900; contains a great mass of Southern official correspondence); E. A. Pollitzer, The Civil War in European Eyes (New York, 1903), especially volumes iii. v. (New York, 1898–1904); Statutes of the Provisional Government of the C.S.A. (Richmond, 1864); Statutes at Large of the C.S.A., First Congress (Richmond, 1864); Public Laws of the Confederate States of America (Richmond, 1864); Statutes at Large of the C.S.A., Second Congress (Richmond, 1864); Documents of the various state governments. (J. C. Sc.)

CONFERENCE, a bringing together (Lat. conferre) for the purpose of discussion, particularly a meeting of members of one or more societies, of representatives of legislative or other bodies, or of different states. Such are the meetings between members of the upper and lower chambers of the British parliament, or
of the United States congress, to adjust matters of difference, and the assemblies of the prime ministers of the various British colonies, held at stated intervals to consult with the imperial government. The title of Colonial Conference was changed to that of Imperial Conference in 1697, but the proposal to change Conference to Council was dropped; it was felt that the administrative functions usually connoted by the word “council” made that title less suitable to an assembly with purely deliberative and consultative powers, which were more aptly expressed by “conference.” In diplomacy the word “conference” is used of a meeting of the representatives of states of greater or less importance for the purpose of settling particular points, as distinguished from a “congress,” which is properly a meeting of the great powers for the settlement of questions of general interest. In practice, however, the distinction is not consistently maintained. The meetings preliminary to a congress and the sessions of the congress itself are also styled “conferences” (see Congress). The word is also applied to the annual assemblies for transacting church business in the Wesleyan Methodist Church of Great Britain and to various similar assemblies in the Methodist Episcopal Church of America (see Methodism).

**CONFESSION** (Lat. confessio, from confessor, acknowledge, confess), a term meaning in general the confession of sin. The term is also used in connection with religious exercises which otherwise might remain undisclosed, especially the acknowledgment of guilt or wrong-doing, either in public or to somebody specially entitled to such knowledge. The term has a special importance (1) in religion, (2) in law.

1. **Religion.** Among the Jews it was ordered that on the Day of Atonement the high priest should make confession of sins in the name of the whole people, and the day is still kept by the Jews with fasting and confession of sins. The Jews were also enjoined to confess their sins individually to God, and in certain cases to man.

In the Gospel confession is scarcely mentioned. But much is said about forgiveness, and the church is empowered to administer God's pardon (John xx. 23 and Matt. xviii. 18). But it should be noted that the primary reference of “binding and loosing” is, according to rabbinical usage, rather to the laying down of rules than to condoning breaches of them; and nothing is said to confine the words. Whosoever sins ye forgive, to the offences of Christians already baptized, and they shall be held to include preaching the Gospel and baptizing converts as well as the administration of internal discipline.

The rest of the New Testament is scarcely more explicit on the subject, which did not become so urgent in the days of early enthusiasm, and when the second coming of the Lord was expected immediately. Baptism conveys the forgiveness of sins, and therefore ought to result in freedom from all willful sin. But what was to be done with the baptized Christian who fell into grievous sin? On the one hand the Epistle to the Hebrews (vi. 4-6) declared that renewals of the lapsed are impossible. On the other, the confession of sins was ordered in James v. 15, 16 and 1 John i. 9, and the exercise of discipline is referred to in 1 Cor. v. and 2 Cor. ii. 5-11 (the identification of the two cases is precarious), Gal. vi. 1 and other passages. Though nothing was as yet systematized, the governing principle is laid down that the sin of the member affects the whole body, and therefore the society is bound to deal with it both from pity for the sinner, and for the sake of its own purity. Without expressing a view on the various questions involved more systematically, the definite discussion of the problems dates from *The Shepherd of Hermas* (published at Rome about A.D. 145). Hermas rejects both the extreme opinions, viz. that to the baptized Christian there is either no such thing as sin, or no such thing as further forgiveness. He represents the church as a woman who offers sinful Christians a unique opportunity for conversion and restoration, which must be seized at once or lost for ever. But while he insists on repentance and mortification, he says nothing about public confession or discipline. Soon bitter controversies arose, especially in the West, where questions of discipline have always been to the fore (see Montanism; Novatianus; Donatists). Speaking broadly the development was from rigour to indulgence, and the three schisms referred to avoided the protests of the puritan minority.

At the beginning of the 3rd century something like a definite system had been established at Carthage and elsewhere. Three groups of sins, classified as (1) idolatry, which included apostasy, (2) adultery or fornication, and (3) murder, were held to exclude the guilty person from sharing in the eucharist until death, that is to say, if he had committed the sin after baptism. Not that it was asserted that he, therefore, could not be forgiven by God; indeed he was urged to pray and fast and undergo church discipline; but the church refused to venture on any anticipation of the divine decision. For other grave sins the baptized person was allowed to undergo discipline once, but only once in his life; if he relapsed again, he must remain excommunicate like the adulterer. Baptism was the first plank thrown out to save the drowning man, “confession” the second, and there was no third chance. It was largely due to the rigour of this rule that men so frequently deferred baptism till late in life. Less serious sins, again, were held to be adequately dealt with by ordinary prayers, such as the Lord’s Prayer, or by the public prayers of the congregation. Public but general confession of sins and intercession for penalties were once a normal part of public worship in the Christian church.

The process of public confession or penance (exomologesis, Greek for public confession) was as follows (see Tertullian, De paenitentia IX., and other writers). The sinner was admitted to it as a privilege by laying on of hands. He wore sackcloth, made his bed in ashes, and fasted or used only the very plainest fare. In secret he gave himself up to ceaseless prayer; in public he threw himself at the brethren’s feet to entreat their intercessions. This went on for a time proportionate to the gravity of the offence, perhaps for years; then, if his sin allowed it, he was readmitted by the bishop and clergy with further laying on of hands. He must still (at least according to later rules) live in strict abstinence, forgoing, e.g., the use of marriage. And if he fell away, he could never be restored again. One can hardly be surprised that Tertullian says that few faced such an ordeal. In this account nothing is said of confession; but it would appear that in early days the sins were made known to the congregation, and in notorious cases they would take the initiative in excommunicating, or a penitent to take advice as to the necessity in his case of undergoing exomologesis, and this, of course, involved confession. Origen implies that in his days the penitent might choose his own spiritual physician. It is to be noticed that the clergy were never admitted to this public discipline; but a cleric might be deposed and then admitted as a layman. Ordinarily the sinful cleric prayed and fasted at his own discretion, and nothing is said of his confessing his sins. In fact far more importance was attached to the discipline than to confession.

Church practice was not the same everywhere at the same time; just because Scripture only gave the ruling principles, therefore the different churches worked out their application in different ways. It is, therefore, natural that we should trace the stages of development through the friction they caused. Thus Calixtus, bishop of Rome 219-223, decided to admit adulterers to exomologesis and so to communion; and Tertullian, now become a Montanist, pours out his scorn on him. Thirty years later, first at Carthage, then at Rome, the same step has been taken with regard to penitent apostates, at least the less guilty of them. But the process that followed was in a double conflict; for while on the one hand the Novatianist schism represents the puritan outcry against such laxity, on the other the martyrs (not indeed for the first time) claimed a position above church law, and gave trouble by issuing libelli paecis, i.e. requests or even orders that so-and-so, and sometimes the name was not inserted, should be readmitted to communion forthwith without undergoing the discipline of exomologesis. It was out of this practice that later on Indulgences grew up.

A further relaxation appears about the same time. Those
under discipline were allowed to receive the eucharist when
in articulo mortis. As this was sometimes effected by means of
the reserved sacrament without any formal reconciliation, even
without the presence of bishop or priest, it affords further
evidence of the emphasis being laid on contrition and submission
to discipline rather than on absolution. Cyprian, Epist. xviii.,
sanctions a dying man's making confession (exomelosesis) of
his sin before a deacon in case of necessity, and being reconciled
by laying on of hands.

At the beginning of the 4th century a system came into use
by which penitents undergoing discipline were divided into four
grades, the lowest being the mourners, then the hearers, the
kneelers and the consistentes (standing). Thus by the 11th
canon of Nicaea certain who had been guilty of apostasy were
to be three years among the hearers, seven among the kneelers,
and two among the consistentes. These grades were distinguished
by their admission to or exclusion from parts of the church and
of divine service; notion of them were allowed to communicate
until their penance was complete, except in articulo mortis.

In the same century at Rome and at Constantinople we hear
of "penitentiaries," that is priests appointed to act for the
bishop in hearing the confession of sins, and deciding whether
public discipline was necessary and, if it was, on its duration;
in other words they prepared the penitents for solemn reconcilia-
tion by the bishop. A scandal at Constantinople in 397 led
to the suppression in that city not only of the office of peni-
tentiary, but practically of public exomelosesis also, and that
seemingly in Eastern Christendom generally, so that the indi-
vidual was left to assess his own penance, and to present
himself for communion at his own discretion. This inevitably
led on to the reiteraton of confession after repeated lapses, and
Chrysostom (bishop of Constantinople, 397-407) was attacked
for allowing such a departure from ancient rule.

But in the West public discipline continued, though under less
and more lenient circumstances. Persecution having ceased, the
question of apostasy had lost its chief significance, and as church
life became public and influential the evils of scandal were
intensified. Penitents, therefore (as a rule), were excused the
painful ordeal of public humiliation, but performed their penances in
secret; only at the end they were publicly reconciled
by the bishop. This was at Rome and Milan appointed to be
done on the Thursday before Easter, and gradually became a
regular practice, the same penitent year after year doing penance
during Lent, and being publicly restored to communion in Holy
Week. Towards the end of the 4th century priests began to be
allowed to take the bishop's place in the re-admission of penitents
and to do it privately. And with this step the evolution of the
system was completed. The abandonment of plenary penitence
(i.e. the full rigour of exomelosesis), the extension of the system
in which there was nothing public about the rites of penance, and
the solemn reconciliation on Ember Thursday, the allowing of
repeated reconciement to this reconciliation, the delegation to priests
of the power to reconcile penitents in private; such were the
successive stages in the development.

The irritations of the barbarians revolutionized the whole
system of daily life. The various tribes were indeed converted
to the faith one after another; but it took centuries to break
them in to anything like obedience to Christian principles of
morality. In consequence the Christian world tended to be
divided into two classes. The first, the religious, including
women and laymen as well as clergy, still maintained the old
ideals of purity and mutual responsibility. Thus in the chapter-
house of a monastery there constantly took place acts of discipline
that depended on the theory that the sin of the individual is
the concern of the society; open confession was made, open penance
exacted. On the other hand, the still half-heathen world outside
broke every moral law, and in the effort to restrain men's vices church discipline became mechanical instead of
sympathetic, penal rather than paternal. The penance was
regarded (not without precedent in earlier times) as the discharge
of a liability due to God or the Church; and so much sin was
reckoned to involve so much debt. Thus we reach what has been
called la peneience tardive. Penitentials or codes defined (even
invented) different degrees of guilt, and assessed the liability
involved much as if a sin gave rise to an action to recover
damages. The Greek penitentials date from about 600; the
Latin are a little later; the most influential was that of Theodore
of Tarsus, who was archbishop of Canterbury from 668 to 690.
Two disastrous results not infrequently arose: a money payment
was often allowed in lieu of acts of penance, and the prayers
and merits of others were held to supply the inadequacy of the
sinner's own repentance (see indulgence). Meanwhile the
constant repetition of confession and reconciliation, together
with the fact that the most tender consciences would be the
most anxious for the assurance of forgiveness, led to the practice
being considered a normal part of the Christian life. It came
to be allowed to be used by priests as well as by laymen. Absolu-
tion was reckoned one of the sacraments, one of the seven when
that mystic number was given to the liturgy; but no agreement was as to what constituted the essential parts of the
saidment, whether the confession, the laying on of hands, the
penance, or the words of dismissal. It was more and more
regarded as the special function of the priest to administer
absolution, though as late as the 16th century we hear of laymen
confessing to and absolving one another on the battlefield
because no priest was at hand. Moreover, the idea of corporate
responisibility and discipline was overshadowed by that of
medicines for the individual soul, though public penance was
still often exacted, especially in cases of notorious crime, as
when Henry II. submitted to the scourge after the murder of Becket.

At last in 1215 the council of the Lateran decreed that every
one of either sex must make confession at least once a year
before his parish priest, or some other priest with the consent
of the parish priest. Treating this rule as axiomatic the School-
men elaborated their analyses of the sacrament of penance,
and efficiency of the process of penance and redemption, mortal
and venial sins. The Council of Trent in 1551 repudiated the
worst corruptions and repelled as slanders certain Charges which
were made against the medieval system; but it retained the
obligation of annual confession, and laid it down that the form
of the sacrament consisted in the priest's words of absolution.
(See Absolution.)

As confession is now administered in the Roman Church, the
disciplinary penance is often little more than nominal, the
recitation of a psalm or the like—stress being laid rather on the
fulness of the confession and on the words of authoritative
absolution. No one is allowed to receive holy communion, if
guilty of "mortal" sin, without resorting to confession; only
if a priest has to celebrate mass, and there is no other priest to
hear his confession, may he receive "unabsolved" after mortal
sin, and without an act of contrition sacrament, mortal sin.
They need not confess "venial" sins. It is common to go to confession,
even though there are only venial sins to be confessed; and in
order to excite contrition people are sometimes advised to confess
over again some moral sin from which they have been previously
absolved. No priest may hear confessions without licence from
the bishop. Certain special sins are "reserved," that is, the
ordinary priest cannot give absolution for them; the matter
must be referred to the bishop, or even the pope. Children begin
to go to confession at about the age of seven.

In the Greek Church confession has become obligatory and
habitual. Among the Lutherans auricular confession survived
the Reformation, but the general confession and absolution
before communion were soon allowed by authority to serve as a
substitute; in Wurttemberg as early as the 17th century, in
Saxony after 1657, and in Brandenburg by decree of the elector
in 1658. Private confession and absolution were, however,
still permitted; though as may be seen from Goethe's experience,
related in his Dichtung und Wahrheit, it tended to become a
mere form, a process encouraged by the fact that the fees
payable for absolution formed part of the pastor's regular
stipend. Since the beginning of the 19th century the practice
of auricular confession has been to a certain extent revived.
among orthodox Lutherans (see Herzog-Hauck, *Realencyklopädie* s. "Beichte").

Travelled to England, Wesley provided for spiritual discipline (1) through the class-meeting, whose leader has to advise, comfort or exhort as occasion may arise; and (2) through the ministers, who have to bear the chief responsibility in the reproof, suspension or expulsion from communion of erring brethren. In the Salvation Army people are continually invited to come forward to the "penitent form," and admissions of past evil living are publicly made. Among the Calvinistic bodies in the British Isles and abroad kirk-discipline has been a stern reality; but in none of them is there private confession or priestly absolution.

The Church of England holds in this matter as in others a central position. The method of confession adopted in the public services of the Church of England, with which the Book of Common Prayer is primarily concerned, may be described as one of general confession to God in the face of the church, to be in secret used by each member of the congregation for the confession of his own particular sins, and to be followed by public absolution. But three other methods of confession for private use are mentioned in the exhortations in the communion service, which constitute the principal directory for private devotions among the authoritative documents of the English Church. First, all men are urged to practise secret confession to God alone, and in it the sins are to be acknowledged in detail. Secondly, where the nature of the offence admits of it, the sinner is to acknowledge his wrongdoing to the neighbour he has aggrieved. And, thirdly, the sinner who cannot satisfy his conscience by these other methods is invited to open his grief to a minister of God's word. Similarly, the sick man is to be moved to make a special confession of his sins if he feels his conscience troubled with any weighty matter. The priest is bound, under the most stringent penalties, never to divulge what he has thus learnt. See the 17th canon of 1604, which, however, excepts crimes "such as by the laws of this realm the priest's own life may be endangered in questioning the same." It is, however, maintained by some that, except in the case of the sick, the only legitimate method of receiving absolution in the Church of England is in the public services of the congregation; and the Church of Ireland has recently made important alterations even in the passages that concern the sick, while the Protestant Episcopal Church of the United States has omitted that part of the visitation service altogether.

It is probable that auricular confession never altogether died out in the Church of England, but it is obvious that evidence on the subject must always be hard to find. Certainly there has been a great increase and development of the practice since the Oxford movement in the early part of the 19th century. Two chief difficulties have attended this revival. In the first place, owing to the general disuse of such ministrations, there were none among the English clergy who had experience in delicate questions of conscience; and there had been no treatment of cases since Sanderson and Jeremy Taylor (see Causality). Those, then, who had to hear penitents unburden their souls were driven to the use of Roman writers on the subject. A book called The Priest in Absolution was compiled, and at first privately circulated among the clergy; but in 1877 a copy was produced in parliament, and gave rise to much scandal and heated debate, especially in the House of Lords and in the newspapers. In the following year Dr. Pusey published a translation of the Abbé J. J. Gaume's *Manual for Confessors*, abridged and "adapted to the use of the English Church." The other chief difficulty arose from the absence of any authoritative restraint on the hearing of confessions by young and unqualified priests, the Church of England merely directing the penitent who wishes for special help to resort to any "discreet and learned minister." In 1877 a petition signed by four hundred and eighty-three clergy was presented to Convocation asking for the "education, selection and licensing of duly qualified confessors." The bishops declined so to act, but drew up a report on the subject of confession. The question excites the keenest feeling, and extreme views are held on either side. On the one hand, it is opposed as the citadel of sacerdotal authority and as a peril to morals. On the other hand, there are those who urge as if auricular confession were a necessary element in every Christian life, and hold that post-baptismal sin of a grave sort can receive forgiveness in no other way. Such a view cannot be found within the covers of the English Prayer-Book.

2. Law.—In criminal procedure confession has always, of course, played an important part, and the attempt to obtain such a confession from the incriminated person, whether by physical torture or by less violent means, was formerly, and in certain countries still remains, a recognized expedient for securing the conviction of the guilty. This method was carried to ruthless extremes by the Inquisition (q.v.), but was by no means unknown in countries in which this institution never gained a foothold; as in England, where torture was practised, though never legalized, for this purpose. In spite of a general tendency to relinquish the inquisitorial method, it is still prevalent in certain countries, notably in France, where the efforts of the prosecution, especially during the preliminary investigations, are directed to extracting a confession from the accused. In English law, on the other hand, the confession of an incriminated person can be received in evidence against him only if it has been free and voluntary. Any threat or inducement held out to make a confession renders the confession inadmissible, even if afterwards made to another person, it having been held that the second confession is likely to be induced by the promise held out by the person to whom the first confession was made. Any inducement to a person to make a confession must refer to some temporal benefit to be gained from it. In conformity with the principle of English law that a person ought not to be made to incriminate himself, it is usual, when a person in custody wishes to make a statement or confession, to caution him that what he says will be used in evidence against him. Particular facts may have an important bearing on the admissibility or otherwise of a confession—immemorial decisions will be found in Archbold's *Criminal Pleading* (23rd ed.). In divorce law, the confession of a wife charged with adultery is always treated with circumspection and caution, for fear of collusion between the parties to a suit. Where, however, such a confession is clear and distinct, the court will usually receive it as evidence against the wife, but not against a co-respondent. In a case where a wife's confession was obtained by falsely stating to her that the suspected co-respondent had confessed, such confession was held admissible.

**CONFESSIONAL** (Late Lat. *confessionale*, neut. adj. from *confessioria*, "pertaining to confession," Fr. *confessionnel*, Ital. *confessionale*), a box, cabinet or stall, in which the priest in Roman Catholic churches sits to hear the confessions of penitents. The confessional is usually a wooden structure, with a centre compartment—entered through a door or curtain—in which the priest sits, and on each side a latticed opening for the penitents to speak through, and a step on which they kneel. By this arrangement the priest is hidden, but the penitent is visible to the public. Confessinals sometimes form part of the architectural scheme of the church; many finely decorated specimens, dating from the late 16th and the 17th centuries, are to be found in churches on the continent of Europe. A notable example, in Renaissance style, is in the church of St.
CONFESSION AND AVOIDANCE—CONFIRMATION 905

Michel at Louvain. But, more usually, confessors are movable pieces of furniture.

The confessors in its modern form dates no farther back than the 16th century, and Du Cange cites the year 1563 for an early use of the word confessionale for the sacrum poenitentiæ tribunal. Originally the term was applied to the place where a martyr or "confessor" (in the sense of one who confesses Christ) had been buried. There are, however, instances (e.g. the confessional of St Trophimus at Arles) where the name was attached to the spot, whether cell or seat, where noted saints were wont to hear confessions. In the popular Protestant view confessional boxes are associated with the scandals, real or supposed, of the practice of auricular confession. They were, however, devised to guard against such scandals by securing at once essential publicity and a reasonable privacy, and by separating priest and penitent. In the middle ages stringent rules were laid down, in this latter respect, by the canon law in the case of confessions by women and especially nuns.

In England, before the Reformation, publicity was reckoned the best safeguard. Thus Archbishop Walter Reynolds, in 1322, says in his Constitutions: "Let the priest choose for himself a convenient place for hearing confessions, where he may be generally by all in the church; and do not let him hear any one, and especially any woman, in a private place, except in great necessity." It would seem that the priest usually heard confessions at the chancel opening or at a bethch end in the nave near the chancel. There is, however, in some churchwardens' accounts mention of a special seat: "the shrowing stool," "shriving pew" or "shriving place" (Gasquet, Parish Life in Mediaeval England, p. 190). At Lenham in Kent there is an ancient armchair in stone, with a stone bench and steps on one side, which appears to be a confessional.

With the revival of the practice of auricular confession in the English Church, confessors were introduced into some of the more "extreme" Anglican churches. Since, however, they certainly formed no part of "the furniture of the church" in the "second year of King Edward VI." they can hardly be considered as covered by the "Sacraments Rubric" in the Prayer-Book. The question of their legality was raised in 1591 in the case of Dasey v. Hinde (vicar of the church of the Annunciation at Brighton) tried before Dr Tristram in the consistory court of Chichester. They were condemned "on the ground that they are not articles of church furniture requisite for or conducive to conformity with the doctrine or practice of the Church of England in relation to the reception of confession" (C. Y. Sturge, Points of Church Law, London, 1907, p. 137).

"Confessional," in the sense of a due payable for the right to hear confession, is now obsolete. As an adjective confessional is used in two senses: (1) of the nature of, or belonging to confession, e.g. "confessional prayers"; (2) connected with confessions of faith, or creeds, e.g. "confessional differences." (W. A. P.)

CONFESSION AND AVOIDANCE, in pleading, the plea admitting that facts alleged in a declaration are true, but showing new facts by which it is hoped to destroy the effect of the allegations. A plea in confession and avoidance neither simply admits nor merely denies; it admits that the facts alleged by the opposite party make out a good prima facie case or defence, but it proceeds to destroy the effect of these allegations either by showing some justification or excuse of the matter charged, or some discharge or release from it. All matter in confession and avoidance must be stated clearly and distinctly, and must be specific. If intended to apply to part only of a statement of claim, it must be so stated.

CONFESSION, in the Christian Church, a word used in the two senses of (1) a person the holy character of whose life and death entitle him or her, in the judgment of the Church, to a peculiar reputation for sanctity, (2) a priest empowered to hear confessions.

(1) In the first sense the word confess was in the early Church sometimes applied loosely to all martyrs, but more properly to those who, having suffered persecution and torture for the faith, were afterwards allowed to die in peace. The present sense of the word, as defined above, developed after the ages of persecution had passed. It came to be applied by custom, as did the predicate "Saint," to the holy men of the past; e.g. Egcbert, archbishop of York (Excerpt. cap. xxviii), speaks of "the holy fathers whom we have styled confessors, i.e. bishops and priests who have served God in chastity." But, as in the case of "saint," the right of declaring the holy dead to be "confessors" was ultimately reserved to the Holy See. The most celebrated instance of the formal bestowal of the style is that of King Edward of England, who was made a "Confessor" on his canonization by Pope Alexander III. in 1161, and has since been commonly known as Edward the Confessor.

(2) The confessors in the second sense is now termed in ecclesiastical Latin confessarius (med. Lat. confessare, to confess), to distinguish him from the "confessor" described above. The functions of the confessor are dealt with in the article CONFESSION (q.v.). Here it need only be pointed out that though, in the Roman Catholic Church, the potestas ordinis of every priest includes the power of granting absolution, according to the entire and discipline of the Church, no priest can be a confessor, i.e. hear confessions, without a special faculty from his bishop.

CONFIRMATION (Lat. confirmatio, from confirmare, to establish, make firm), in the Christian sense, the initiatory rite of laying on of hands, supplementary to and completing baptism, and especially connected with the gift of the Holy Ghost to the candidate. The words "confirm" and "confirmation" are not used in the Bible in this technical sense, which has only grown up since the 4th century, and only in the Western churches of Christendom and in their offshoots, but the rite itself has been practised in the Church from the beginning. The history of confirmation has passed through three stages. In the first stages of the Church, when it was recruited chiefly by converts who were admitted in full age, confirmation, or the laying on of hands (Heb. vi. 2), followed close upon baptism, and in the majority of cases the two were combined in a single service. But only the highest order of ministers could confirm (see Acts viii. 14-17); whereas priests and deacons, and in an emergency laymen and even women, could baptize. There was therefore no absolute certainty that a believer who had been baptized had also received confirmation (Acts xii. 2). But two circumstances tended to prevent the occurrence of such irregularities. In the first place, there were in early days far more bishops in proportion to the number of believers than is the custom now; and, secondly, it was the rule (except in cases of emergency) to baptize only in the season from Easter to Pentecost, and the bishop was always present and laid his hands on the newly baptized. Moreover, in the third and fourth centuries the infants of Christian parents were frequently left unbaptized for years, e.g. Augustine of Hippo. Later, when the Church had come to be tolerated and patronized by the state, her numbers increased, the rule that fixed certain days for baptism broke down, and it was impossible for bishops to attend every baptismal service. Therefore the East and West adopted different methods of meeting the difficulty. In the East the greater emphasis was laid on the laying on of hands, which had long been an adjunct of the laying on of hands: the oil was consecrated by the bishop, and the child anointed or "sealed" with it by the parish priest, and this was reckoned as its confirmation. With its baptism thus completed, the infant was held to be capable of receiving holy communion. And to this day in the Eastern Church the infant is baptized, anointed and communicated by the parish priest in the course of a single service; and thus the bishop and the laying on of hands have disappeared from the ordinary service of confirmation. The West, on the other hand, deferred confirmation, not at first till the child had reached years of discretion, though that afterwards became the theory, but from the necessities of the case. The child was baptized at once, that it might be admitted to the Church, while the completion of its baptism was put off till it could be brought to a bishop. Western canonists insist on both points at once; baptism is not to be deferred beyond a week.
nor confirmation beyond seven years. And to give an historical example, Henry VIII. had his daughter, afterwards Queen Elizabeth, both baptized and confirmed when she was only a few days old. And still the rubrics of the English Prayer-Book direct that the person who is baptized as an adult is to "be confirmed by the bishop so soon after his baptism as conveniently may be."

But theologians in the West had elaborated a theory of the grace of confirmation, which made its severance from baptism seem natural; and at the time of the Reformation, while neither side favoured the Eastern practice, the reformers, with their strong sense of the crucial importance of faith, emphasized the action of the individual in the service, and therefore laid it down as a rule that confirmation should be deferred till the child could learn a catechism on the fundamentals of the Christian faith, which Calvin thought he might do by the time he was ten. Many of the Protestant bodies have abandoned the rite, but it remains among the Lutherans (who, whether episcopal or not, attach great importance to it) and in the group of Churches in communion with the Church of England. In the Catholic Apostolic Church ("Irvingites") confirmation is called "sealing," and is administered by the "angels." Among the Roman Catholics it is one of the functions of the bishop to baptize and to baptize at about the age of eight: in many cases less emphasis is laid on the confirmation than on the first communion, which follows it.

At the last revision of the Book of Common Prayer an addition was made to the service by prefixing to it a solemn renewal of their baptismal vows by the candidates; and, in the teeth of history and the wording of the service, this has often been taken to be the essential feature of confirmation. Practically, the preparation of candidates for confirmation is the most important and exacting duty of the Anglican parish priest, as the administration of the rite is the most arduous of a bishop's tasks; and after a long period of slovenly neglect these duties are now generally discharged with great care: classes are formed and instruction is given for several weeks before the coming of the bishop to lay on hands "after the example of the Holy Apostles" (prayer in the Confirmation Service). Of late years there has been a controversy among Anglican theologians as to the exact nature of the gift conveyed through confirmation, or, in other words, whether the Holy Spirit can be said to have come on the candidate in the form in which it has been said to have been conferred on the first candidates. The view that identification of confirmation rather than baptism with the Pentecostal outpouring of the Spirit on the Church has had to contend against a long-established tradition, but appeals to Scripture (Acts viii. 16) and to patristic teaching.

CONFIRMATION OF BISHOPS. In canon law confirmation is the act by which the election of a new bishop receives the assent of the proper ecclesiastical authority. In the early centuries of the history of the Church the election or appointment of a suffragan bishop was confirmed by the metropolitan and his suffragans assembled in synod. By the 4th council of the first council of Nicea (a.d. 325), however, it was decreed that the right of confirmation should belong to the metropolitan bishop of each province, a rule confirmed by the 15th council of the council of Laodicea.

For the appointment of a metropolitan no papal confirmation was required either in the West or East; but the practice which grew up, from the 6th century onwards, of the popes presenting the pallium (q.v.), at first honoris causa, to newly appointed metropolitan gradually came to symbolize the licence to exercise metropolitan jurisdiction. By the 8th and 9th centuries the papal right of confirmation by this means was strenuously asserted; yet as late as the 13th century there were instances of metropolitans exercising their functions without receiving the pallium, and it was not till after this date that the present rule and practice of the Roman Catholic Church was definitively established (see Hinschius, Kirchenrecht, ii. p. 28 and notes). The canonical right of the metropolitans to confirm the election of his suffragans was still affirmed by Gratian; but from the time of Pope Alexander III. (1159–1181) the canon lawyers, under the influence of the False Decretals, began to claim this right for the pope (Febronius, De statu ecclesiae, 2nd ed., 1765, cap. iv. § 3, 2). From the 13th century onwards it was effectively exercised, though the all but universal practice of the popes of reserving and providing to vacant bishoprics, initiated by Clement V., obscured the issue, since in the case of papal nominations no confirmation was required. The question, however, was raised, in connection with that of the papal reservations and provisions, at the councils of Constance and Basel. The former shelved it in the interests of peace; but the latter once more formulated the principle that elections in the churches were to be free and their result confirmed according to the provisions of the common law (justa juris communi dispositionem), i.e. by the immediate superior to whom the right of confirmation belonged (Febronius, op. cit. Appendix, p. 784).

In England, where the abuse of provisors had been most acutely felt, the matter was dealt with during the vacancy of the see by the decree of the deposition of John XXIII. at Constance (May 1415) and the enactments of the Council of Constant (November 1417). During the interval the only possible way of appointing a bishop was by the ancient method of canonical election and confirmation. Shortly after the deposition of John XXIII., Henry V. assented to an ordinance that during the vacancy of the Holy See bishops-elect should be confirmed by their metropolitans (Rotuli Parliamentorum, iv. p. 71); but the ordinance was not recorded on the Statute Roll. Three bishops only, namely, John Chaudel of Salisbury, Edmund de Lacey of Hereford and John Wakering of Norwich, were confirmed by the archbishop of Canterbury during the papal vacancy. When Martin V. was elected pope in 1417 he resumed the practice of providing bishops, and from this time till the Reformation the canonical election and confirmation of a bishop in England was a rare exception.

In Roman Catholic countries the complete control of the papacy over the election and appointment of bishops has since the Reformation become firmly established, in spite of the efforts of Gallicans and "Febronians" to reassert what they held to be more Catholic usage (see GALLICANISM; FEBRONIANISM; BISPONIUM.)

In England at the Reformation the share of the papacy in appointing bishops was abolished, but the confirmation became almost formal in character. By 25 Hen. VIII. c. 20, s. 4, it is provided that after an episcopal election a royal mandate shall issue to the archbishop of the province "requiring him to confirm the said election," or, in case of an archbishop-elect, to one archbishop and two bishops, or to four bishops, "requiring and commanding" them with all speed and celerity to confirm it. This practice still prevails in the case of dioceses which have chapters to elect. The confirmation has usually been performed by the archbishop's vicar-general, and, in the southern province, at the church of St Mary-le-Bow, London; but since 1901 it has been performed, in part, at the Church House, Westminster, in consequence of the disorder in the proceedings at Bow church on the confirmation there of Dr Winnington Ingram as bishop of London. All objects are cited to appear in pain of contumacy after the old form; but although the knowledge that opposition shall be offered has been a safeguard against improper nominations, e.g. in the case of Dr Clarke's Arian, confirmation has never been refused since the Reformation. Dr Rives, acting for the vicar-general, declined to receive objections made to Richard Montague's election to the see of Chichester on the ground that they were not made in legal form. An informal protest against the confirmation of Dr Prince Lee of Manchester in 1848 was almost immediately followed by another in due form against that of Dr Hampden, elect of Hereford. The vicar-general refused to receive the objections, and an application to the queen's bench for a mandamus was unsuccessful, the judges being divided, two against two. In 1869, at the
CONFISCATION—CONFUCIUS 907

CONFISCATION of Dr Temple's election as bishop of Exeter, the vicar-general heard counsel on the question whether he could receive objections, and decided that he could not. When the same prelate was elected to Canterbury, the course was laid down was followed, as also at the confirmation of Dr Mandell Creighton's election to the see of London. Objections were again raised, in 1902, against Dr Charles Gore, elect of Worcester; and an application was made to the king's bench for a mandamus against the archbishop and his vicar-general when the latter declined to entertain them. By a unanimous judgment (February 10) the court, consisting of the lord chief justice (Lord Alverstone) and Justices Wright and Ridley, refused the mandamus. Without deciding that objections (e.g. to the identity of the elect, or the genuineness of documents) could never be investigated by the vicar-general or the archbishop, it held that they could not even entertain objections of the kind alleged. At the confirmation of Dr Cosmo Gordon Lang's election as archbishop of York, held in the Church House on the 20th of January 1909, objections were raised on behalf of the Protestant Truth Society to the confirmation, on the ground that the archbishop-elect had, while bishop suffragan of Stepney, connived at and encouraged flagrant breaches of the law as to church ritual, taken part in illegal ceremonies, and the like. The objectors were heard by the archbishop of Canterbury and the other commissioners in chambers, the decision being that, in accordance with the rules for the confirmation of archbishops, such objections could not lawfully be received since they did not fall within the province of the commissioners. The archbishop also pointed out that the form of citation (to objectors) had been modified since 1902, but suggested that it was "a matter for consideration whether the terminology of the citation could be altered so as to bring everything into complete accordance with the law of the Church and realm" (see The Times, January 21, 1909). Formerly the archbishop had the right of option, i.e. of choosing any one piece of preferment in the gift of a bishop confirmed by him, and bestowing it upon whom he would; but this has been held to be abolished by a clause in the Cathedral Act of 1850 (3 & 4 Vict. c. 113, s. 42). And the election of a dean by a cathedral chapter used to receive the bishop's confirmation (Oughton, Ordo Judiciorum, No. ccxxvii.).

CONFISCATION (from Lat. confiscare, to confiscate, to consign to the fiscus, or imperial treasury), in Roman law the seizure and transfer of private property to the fiscus by the emperor; hence the appropriation, under legal authority, of private property to the state; in English law the term embraces forfeiture (q.v.) in the case of goods, and escheat (q.v.) in the case of lands, for crime or in default of heirs (see also EMINENT DOMAIN). Goods may also be confiscated by the state for breaches of statutes relating to customs, excise or explosives. In the United States among the "war measures" during the Civil War, acts were passed in 1861 and 1862 confiscatving, respectively, property used for "insurrectionary purposes" and property generally of those engaged in rebellion. The word is used, popularly, of spoliation under legal forms, or of any seizure of property without adequate compensation.

CONFOLENS, a town of south-western France, capital of an arrondissement in the department of Charente, 44 m. N. of Angoulême by rail. Pop. (1906) 2546. Confolens is situated on the banks of the Vienne at its confluence with the Gôre. It is an ancient town, with steep narrow streets bordered by old houses. It possesses two bridges of the 15th century, remains of a castle of the 12th century, and two churches, one of the 11th, another of the 14th and 15th centuries. The subprefecture, a tribunal of first instance, and a communal college are among the public institutions. Flour, leather, laces and paper are its industrial products, and there is trade in timber and cattle.

CONFUCIUS [K'ang t'ung] (551 B.C.-479 B.C.), the famous sage of China. In order to understand the events of his life and the influence of his opinions, we must endeavour to get some impression of the China that existed during his lifetime, at the 5th and 6th centuries B.C. The dynasty of Chow, the third which within historic time had ruled the country, lasting from 1122 to 256 B.C., had passed its zenith, and its kings no longer held the sceptre with a firm grasp. The territory under their sway was not a sixth part of the present empire. For thirteen years of his life Confucius wandered about from state to state, seeking rest and patrons; but his journeys were confined within the modern provinces of Ho-nan and Shan-tung, and the borders of Chih-li and Hu-peh.

Within the China of the Chow dynasty there might be a population, in Confucius's time, of from 10,000,000 to 15,000,000. We read frequently, in the classical books, of the "ten thousand states" in which the people were distributed, but that is merely a grand exaggeration. In what has been called, though erroneously, as we shall see, Confucius's History of his own Times, we find only 23 states of note, and the number of all the states, large and small, was 256. The states were independent of China, and the only reason we have for the existence of much more extensive supplement to it by Tso K'iu-ming, not much posterior to the sage, is under 150. Chow was a feudal kingdom. The lords of the different territories belonged to five orders of nobility, corresponding closely to the dukes, marquises, earls, counts and barons of feudal Europe. The theory of the constitution required that the princes, on every fresh succession, should receive investiture from the king, and thereafter appear at his court at stated times. They paid to him annually certain specified tributes, and might be called out with their military levies at any time in his service. A feudal kingdom was sure to be a prey to disorder unless there were energy and ability in the character and administration of the sovereign; and Confucius has sketched, in the work referred to above, the Annals of Lu, his native state, for 242 years, from 722 to 481 B.C., which might almost be summed up in the words: "In those days there was no king in China, and every prince did what was right in his own eyes." In 1770 B.C. a northern horde had plundered the capital, which was then in the present department of Si-gan, Shen-si, and killed the king, whose son succeeded, and the dynasty of Chow was established himself in a new capital near the present city of Lo-yang in Ho-nan; but from that time the prestige of Chow was gone. Its representatives continued for four centuries and a half with the title of king, but they were less powerful than several of their feudatories. The Annals of Lu, enlarged by Tso K'iu-ming so as to embrace the history of the kingdom generally, are as full of life and interest as the pages of Froissart. Feats of arms, great battles, heroic virtues, devoted friendships and atrocity crimes make the chronicles of China in the 5th, 6th and 7th centuries before the birth of Christ as attractive as those of France and England in the 14th and some other centuries after it. There was in China in the former period more of literary culture and of many arts of civilization than there was in Europe in the latter. Not only the royal court, but even feudal court had its historiographers and musicians. Institutions of an educational character abounded. There were ancient histories and poems, and codes of laws, and books of ceremonials. Yet the period was one of widespread suffering and degeneracy. While the feudal government was feeble, disorganization was at work in each state.

Three things must be kept in mind when we compare feudal China with feudal Europe. First, we must take into account the long duration of the time through which the central authority was devoid of vigour. For about five centuries state was left to contend with state, and clan with clan in the several states. The result was chronic misrule, and misery to the masses of the people, with frequent famines. Secondly, we must take into account the institution of polygamy, with the low status assigned to woman and the many restraints put upon her. In the ancient
poems, indeed, there are a few pieces which are true love songs, and express a high appreciation of the virtue of their subjects; but there are many more which tell a different tale. The intrigues, quarrels, murders and grossnesses that grew out of this social condition it is difficult to conceive, and would be impossible to detail. Thirdly, we must take into account the absence of strong and definite religious beliefs, properly so called, which has always been a characteristic of the Chinese people. We are little troubled, of course, with heresies, and are not shocked by the outbreaks of theological zeal; but where thought as well as action does not reach beyond the limits of earth and time, we do not find man in his best estate. We miss the graces and consolations of faith; we have human efforts and ambitions, but they are unimpressed with divine impulses and heavenly aspi- rings.

Confucius appeared, according to Mencius, one of his most distinguished followers (371–286 B.C.), at a crisis in the nation's history. "The world," he says, "had fallen into decay, and right principles had disappeared. Perverse discourses and oppressive deeds were waxen rife. Ministers murdered their rulers and oppressed their fathers. Confucius was frightened by what he saw, and undertook the work of reformation." The sage was born, according to the historian Sze-ma Ch'ien, in the year 550 B.C.; according to Kung-yang and Kung-liang, two earlier commentators on his Annals of Lu, in 552; but all three agree in the month and day assigned to his birth, which took place in winter. His clan name was K'ung, and Confucius is merely the Latinized form of K'ung Fu-tze, meaning "the philosopher or master K'ung." He was a native of the state of Lu, a part of the modern Shan-tung, embracing the present department of Yen-chow and other portions of the province. Lu had a great name among the other states of Chou, its marquises being descended from the duke of Chou, the legislator and consolidator of the dynasty which had been founded by his father and brother, the famous kings Wân and Wu. Confucius's own ancestry is traced up, through the sovereigns of the previous dynasty of Shang, to Hwang-ti, whose figure appears out through the mists of fable in prehistoric times. A scion of the house of Shang, the surname of which was Tze, was invested by King Wu-Wang with the dukedom of Sung in the present province of Ho-nan. There, in the Tse line, towards the end of the 8th century B.C., we find a K'ung Kia, whose posterity, according to the rules for the dropping of surnames, became the K'ung clan. He was a high officer of loyalty and probity, and unfortunately for himself had a wife of extraordinary beauty. Hwa Tuh, another high officer of the duchy, that he might get this lady into his possession, brought about the death of K'ung Kia, and was carrying his prize in a carriage to his own palace, when she strangled herself on the way. The K'ung family, however, became reduced, and by-and-by its chief representative moved from Sung to Lu, where in the early part of the 6th century we meet with Shu-liang Heih, the father of Confucius, as commandant of the district of Tsow, and an officer renowned for his feats of strength and daring.

There was thus no grander lineage in China than that of Confucius; and on all his progenitors, since the throne of Shang passed from their line, with perhaps one exception, he could look back with complacency. He was the son of Heih's old age. That officer, when over seventy years, and having already nine daughters and one son, because that son was a cripple, sought an alliance with a gentleman of the Yen clan, who had three daughters. The father submitted to them Heih's application, saying that, though he was old and austere, he was of most illustrious descent, and they need have no misgivings about him. Ching-tsal, the youngest of the three, observed that it was for their father to decide in the case. "You shall marry him," said the father, and accordingly she became the bride of the old man, and in the next year the mother of the sage. It is one of the undesignated coincidences which confirm the credibility of Confucius's history, that his favourite disciple was a scion of the Yen clan.

Heih died in the child's third year, leaving his family in straitened circumstances. Long afterwards, when Confucius was complimented on his acquaintance with many arts, he accounted for it on the ground of the poverty of his youth, which obliged him to acquire a knowledge of matters belonging to a mean condition. When he was five or six, people took notice of his fondness for playing with his companions at setting out sacrifices, and at postures of ceremony. He tells us himself that at fifteen his mind was set on learning; and at nineteen, according to the ancient and modern practice in China in regard to early unions, he was married,—his wife being from his ancestral state of Sung. A son, the only one, so far as we know, that he ever had, was born in the following year; but he had subsequently two daughters. Immediately after his marriage we find him employed under the chief of the Ki clan to whose jurisdiction the district of Tsow belonged, first as keeper of stores, and then as superintendent of parks and herds. Mencius says that he undertook such mean offices because of his poverty, and distinguished himself by the efficiency with which he discharged them, without any attempt to become rich.

In his twenty-second year Confucius commenced his labours as a teacher. He did so at first, probably, in a humble way; but a school, not of boys to be taught the elements of learning, but of young and inquiring spirits who wished to be instructed in the principles of right conduct and government, gradually gathered round him. He accepted the substantial aid of his disciples; but he rejected none who could give him even the smallest fee, and he would retain none who did not show earnestness and capacity. "When I have presented," he said, "one corner of a subject, and the pupil cannot of himself make out the other three, I do not repeat my lesson."

Two years after, his mother died, and he buried her in the same grave with his father. Some idea of what his future life was likely to be was already present to his mind. It was not the custom of antiquity to raise any tumulus over graves, but Confucius resolved to innovate in the matter. He would be travelling, he said, to all quarters of the kingdom, and must therefore have a mound by which to recognize his parents' resting-place. He returned home from the interment alone, having left his disciples to complete this work. They were long in rejoining him, and had then to tell him that they had been detained by a heavy fall of rain, which threw down the first product of their labour. He burst into tears, and exclaimed, "Ahl they did not raise mounds over their graves in antiquity." His affection for the memory of his mother and dissatisfaction with his own innovation on ancient customs thus blended beauty; and we can sympathize with his tears. For the regular period of 27 months, commonly spoken of as three years, he observed all the rules of mourning. When they were over he allowed five more days to elapse before he would take his lute, of which he had been devotedly fond, in his hands. He played, but when he tried to sing to the accompaniment of the instrument, his feelings overcame him.

For some years after this our information about Confucius is meagre. Indeed, during his devotion to the study of music and of ancestral mythology, and we can perceive that his character was more and more appreciated by the principal men of Lu. He had passed his thirtieth year when, as he tells us, "I stood firm" in his convictions on all the subjects of the learning of which he had been devotedly fond, in his hands. He played, and when he tried to sing to the accompaniment of the instrument, his feelings overcame him.

For some years after this our information about Confucius is meagre. Indeed, during his devotion to the study of music and of ancestral mythology, and we can perceive that his character was more and more appreciated by the principal men of Lu. He had passed his thirtieth year when, as he tells us, "I stood firm" in his convictions on all the subjects of the learning of which he had been devotedly fond, in his hands. He played, and when he tried to sing to the accompaniment of the instrument, his feelings overcame him.

On his return to Lu, in the same year, that state fell into great
disorder. The marquis was worsted in a struggle with his ministers, and fled to the neighbouring state of Ts’i. Thither also went Confucius, for he would not countenance by his presence the men who had driven their ruler away. He was accompanied by many of his disciples; and as they passed by the T’ai Mountain, an incident occurred which may be narrated as a specimen of the way in which he communicated to them his lessons. The attention of the travellers was arrested by a woman weeping and wailing at a grave. The sage stopped, and sent one of his followers to ask the reason of her grief. “My husband’s father,” said she, “was killed here by a tiger, and my husband also, and now my son has met the same fate.” Being asked why she did not leave so fatal a spot, she replied that there was there no oppressive government. “Remember this,” said Confucius to his disciples, “remember this, my children, oppressive government is fiercer and more feared than a tiger.”

He did not find in Ts’i a home to his liking. The marquis of the state was puzzled how to treat him. The teacher was not a man of rank, and yet the prince felt that he ought to give him more honour than rank could claim. Some counsellors of the court spoke of him as “impracticable and conceited, with a thousand peculiarities.” It was proposed to assign to him a considerable revenue, but he would not accept it while his counsels were not followed. Dissatisfactions ensued, and he went back to Lu.

There for fifteen more years he continued in private life, prosecuting his studies, and receiving many accessions to his disciples. He had a difficult part to play with the different parties in the state, but he adroitly kept himself aloof from them all; and at last, in his fifty-second year, he was made chief magistrate of the city of Ching-tu. A marvellous reformation, we are told, forthwith ensued in the manners of the people; and the marquis, a younger brother of the one that fled to Ts’i and died there, called him to higher office. He was finally appointed minister of crime,—and there was an end of crime. Two of his disciples at the same time obtained influential positions in the two most powerful clans of the state, and co-operated with him. He signalled his vigour by the punishment of a great officer and in negotiations with the state of Ts’i. He laboured to restore to the marquis his proper authority, and as an important step to that end, to dismantle the fortified cities where the great chiefs of clans maintained themselves like the barons of feudal Europe. For a couple of years he seemed to be master of the situation. “He strengthened the ruler,” it is said, “and repressed the barons. A transforming government went abroad. Dishonesty and insolence hid their heads. Loyalty and good faith became the characteristics of the men, and chastity and docility those of the women. He was the idol of the people, and flew in songs through their mouths.”

The sky of bright promise was soon overcast. The marquis of Ts’i and his advisers saw that if Confucius were allowed to prosecute his course, the influence of Lu would become supreme throughout the kingdom, and Ts’i would be the first to suffer. A large company of beautiful women, trained in music and dancing, and a troop of fine horses, were sent to Lu. The bait took; the women were welcomed, and the sage was neglected. The marquis forgot the lessons of the master, and yielded supinely to the fascinations of the harem. Confucius felt that he must leave the state. The neglect of the marquis to send round, according to rule, among the ministers portions of the flesh after a great sacrifice, furnished a plausible reason for leaving the court. He withdrew, though very unwillingly and slowly, hoping that a change would come over the marquis and his counsellors, and a message of recall be sent to him. But no such message came; and he went forth in his fifty-sixth year to a weary period of wandering among various states.

A disciple once asked Confucius what he would consider the first thing to be done, if intrusted with the government of a state. His reply was, “The rectification of names.” When told that such a thing was wide of the mark, he held to it, and indeed his whole social and political system was wrapped up in the saying. He had told the marquis of Ts’i that good government obtained when the ruler was ruler, and the minister minister; when the father was father, and the son son. Society, he considered, was an ordnance of heaven, and was made up of five relationships—ruler and subject, husband and wife, father and son, elder brothers and younger, and friends. There was rule on the one side of the first four, and submission on the other. The rule should be in righteousness and benevolence; the submission in righteousness and sincerity. Between friends the mutual promotion of virtue should be the guiding principle. It was true that the duties of the several relations were being continually violated by the passions of men, and the social state had become an anarchy. But Confucius had confidence in the preponderating goodness of human nature, and in the power of example in superiors. “Not more surely,” he said, “does the grass bend before the wind than the masses yield to the will of those above them.” Given the model ruler, and the model people would forthwith appear. And he himself could make the model ruler. He could tell the princes of the states what they ought to be; and he could point them to examples of perfect virtue in former times,—to the sage founders of their own dynasty; to the sage T’ang, who had founded the previous dynasty of Sung; to the sage Yu, who first established a hereditary kingdom in China; and to the greater sages still who lived in a more distant golden age. With his own lessons and those patterns, any ruler of his day, who would listen to him, might reform and renovate his own state, and his influence would break forth beyond its limits till the face of the whole kingdom should be filled with a multitudinous relation-keeping, well-fed, happy people. “If any ruler,” he once said, “would submit to me as his director for twelve months, I should accomplish something considerable; and in three years I should attain the realization of my hopes.” Such were the ideas, the dreams of Confucius. But he had not been able to get the ruler of his native state to listen to him. His sage counsels had melted away before the glance of beauty and the pomp of life.

His professed disciples amounted to 3000, and among them were between 70 and 80 by whom he described as “scholars of extraordinary ability.” The most attached of them were seldom long away from him. They stood or sat reverently by his side, watched the minutest particulars of his conduct, studied under his direction the ancient history, poetry and rites of their country, and treasured up every syllable which dropped from his lips. They have told us how he never shot at a bird perchng nor fished with a net, the creatures not having in such a case a fair chance for their lives; how he conducted himself in court and among villagers; how he ate his food, and lay in his bed, and sat in his carriage; how he rose up before the old man and the mourner; how he changed countenance when it thundered, and when he saw a grand display of viands at a feast. He was free and unreserved in his intercourse with them, and was hurt once when they seemed to think that he kept back some of his doctrines from them. Several of them were men of mark among the statesmen of the time, and it is the highest testimony to the character of Confucius that he inspired them with feelings of admiration and reverence. It was they who set the example of speaking of him as the greatest of men since the lawgiver; it was they who struck the first notes of that psalm which has gone on resonating to the song of the ancients.

Confucius was in his fifty-sixth year when he left Lu; and thirteen years elapsed ere he returned to it. In this period were comprised his travels among the different states, when he hoped, and ever hoped in vain, to meet with some prince who would accept him as his counsellor, and initiate a government that should become the centre of a universal reformation. Several of the princes were willing to entertain and support him; but for all that he could say, they would not change their ways.

His first refuge was in Wei, a part of the present Ho-nan, the marquis of which received him kindly; but he was a weak man, ruled by his wife, a woman notorious for her accomplishments and wickedness. In attempting to pass from Wei to another state, Confucius was set upon by a mob, which mistook...
him. His last own year, 478 B.C., dawned on him with the tragic end of his next beloved disciple, Tze-lu. Early one morning, we are told, in the fourth month, he got up, and with his hands behind his back, dragging his staff, he moved about his door, crooning over—

"The great mountain must crumble,
The strong beam must break,
The wise man must wither away like a plant."

Tze-kung heard the words, and hastened to him. The master told him a dream of the previous night, which, he thought, presaged his death. "No intelligent ruler," he said, "arises to take me as his master. My time has come to die." He took to his bed, and after seven days expired. Such is the account we have of the last days of the sage of China. His end was not unimpressive, but it was melancholy. Disappointed hopes made his soul bitter. No wife nor child was left to do the offices of affection, nor was the expectation of another life with him, when he passed away among men. He uttered no prayer, and he betrayed no apprehension. Years before, when he was very ill, and Tze-lu asked leave to pray for him, he expressed a doubt whether such a thing might be done, and added, "I have prayed for a long time." Deep-treasured now in his heart may have been the thought that he had served his generation by the will of Heaven.

When their master thus died, his disciples buried him with great pomp. A multitude of them built huts near his grave, and remained there, mourning as for a father, for nearly three years; and when all the rest were gone, Tze-kung, the last of his favourite three, continued alone by the grave for another period of the same duration. The news of his death went through the states as with an electric thrill. The man who had been neglected when alive seemed to become all at once an object of unbounded admiration. The tide began to flow which has hardly ever ebbed during three-and-twenty centuries.

The grave of Confucius is in a large rectangle separated from the rest of the K'ung cemetery, outside the city of K'iu-fow. A magnificent gate gives admission to a fine avenue, lined with cypress trees and leading to the tomb, a large and lofty mound, with a marble statue in front, bearing the inscription of the title given to Confucius under the Sung dynasty:—"The most sagely ancient Teacher; the all-accomplished, all-informed King."

A little in front of the tomb, on the left and right, are smaller monuments, each bearing the name of some of his sons and grandsons, from the latter of whom we have the remarkable treatise called The Doctrine of the Mean. All over the place are imperial tablets of different dynasties, with glowing tributes to the one man China delights to honour; and on the right of the grandson's mound is a small house said to mark the place of the hut where Tze-kung passed his nearly five years of loving vigil. On the mound grow cypresses, acacias, what is called "the crystal tree," said not to be elsewhere found, and the Achilles, the plant whose stalks were employed in ancient times for purposes of divination.

The adjoining city is still the home of the K'ung family; and there are said to be in it some 40,000 or 50,000 of the descendents of the sage. The chief of the family has large estates by imperial gift, with the title of "Duke by imperial appointment and hereditary right, continuator of the sage."

The dynasty of Chow finally perished two centuries and a quarter after the death of the sage at the hands of the first historic emperor of the nation,—the first of the dynasty of Ts'ìn, who swept away the foundations of the feudal system. State after state went down before his blows, but the name and followers of Confucius were the chief obstacles in his way. He made an effort to destroy the memory of the sage from off the earth, consigning to the flames all the ancient books from which he drew his rules and examples (save one), and burying alive hundreds of scholars who were ready to swear by his name. But Confucius could not be so extinguished. The tyranny of Ts'ìn was of short duration, and the next dynasty, that of Han, while entering into the new China, found its surest strength in doing honour to his name, and trying to gather up the wreck of the ancient books. It is
difficult to determine what there was about Confucius to secure for him the influence which he has wielded. Reference has been made to his literary tasks; but the study of them only renders the undertaking more difficult. He left no writings in which he detailed the principles of his moral and social system. The Doctrine of the Mean, by his grandson Tsze-sze, and The Great Learning, by Ts'ang Sin, the most profound, perhaps, of his disciples, give us the fullest information on that subject, and contain many of his sayings. The Lun-Yü, or Analects, "Discourses and Dialogues," is a compilation in which many of his disciples must have taken part, and has great value as a record of his ways and utterances; but its chapters are mostly disjecta membra, affording faint traces of any guiding method or mind. Mencius, Hsiin K'ing and writers of the Han dynasty, whose works, however, are more or less apocryphal, tell us much about him and his opinions, but all in a loose and unconnected way.

No Chinese writer has ever seriously undertaken to compare him with the philosophers and sages of other nations. The sage, probably, did not think it necessary to put down many of his own thoughts in writing, for he said of himself that he was "a transmitter, and not a maker." Nor did he lay claim to any divine revelations. He was not born, he declared, with knowledge, but was fond of antiquity, and earnest in seeking knowledge there. The rule of life for men in all their relations, he held, was to be found within themselves. The right development of that rule, in the ordering not of the individual only, but of society, was to be found in the words and institutions of the ancient sages.

The literature of China, both in its whole and in its parts, has been of immense value to the Chinese literati, and all other men are indebted to him for what they know of China before his time, though all the contents of the ancient works have not come down to us. He wrote, we are told, a preface to the Shu King, or Book of Historical Documents. The preface is, in fact, only a schedule, without any remark by Confucius himself, giving the names of 100 books, of which it consisted. Of these we now possess 59, the oldest going back to the 23rd century, and the latest dating in the 8th century B.C. The credibility of the earlier portions, and the genuineness of several of the documents, have been questioned, but the collection as a whole is exceedingly valuable.

The Shih king, or Ancient Poems, as existing in his time, or compiled by him (as generally stated, contrary to the evidence in the text) consisted of 314 pieces, of which we possess 305. The latest of them dates 953 years B.C., and the oldest of them ascends perhaps twelve centuries higher. It is the most interesting book of ancient poetry in the world, and many of the pieces are really fine ballads. Confucius was wont to say that he who was not acquainted with the Shih was not fit to be conversed with, and that the study of it would produce a mind without a single depraved thought. This is nearly all we have from him about the poems.

The Li ki, or Books of Rites and Ancient Ceremonies and of Institutions, chiefly of the Chow dynasty, have come down to us in a sadly mutilated condition. They are still more than sufficiently voluminous, but they were edited, when recovered under the Han dynasty, with so many additions, that it is hardly worth while to speak of them in connexion with Confucius, though much of what was added to them is occupied with his history and sayings.

Of all the ancient books not one was more prized by him than the Yi king, or "The Book of Changes," the rudiments of which are assigned to Fuh-hi about the 30th century B.C. Those rudiments, however, are merely the 8 trigrams and 64 hexagrams, composed of a whole and a broken line (— —), without any text or explanation of them earlier than the rise of the Chow dynasty. The leather thongs, by which the tablets of Confucius's copy were tied together, were thrice worn out by his constant handling. He said that if his life were lengthened he would give fifty years to the study of the Yi, and might then be without great faults. This has come down to us entirely. If not intended from the first for purposes of divination, it was so used both before and after Confucius, and on that account it was exempted, through the superstition of the emperor of the Ts'in dynasty, from the flames. It is supposed to give a theory of the phenomena of the physical universe, and of moral and political principles by the trigrams and the different lines and numbers of the hexagrams of Fuh-hi. Almost every sentence in it is enigmatic. As now published, there are always subjoined to it certain appendixes, which are ascribed to Confucius himself. Pythagoras and he were contemporaries, and in the fragments of the Samian philosopher about the "elements of numbers as the elements of realities" there is a remarkable analogy with much of the Yi. No Chinese critic or foreign student of Chinese literature has yet been able to give a satisfactory account of the book.

But a greater and more serious difficulty is presented by his last literary labour, the work claimed by him as his own, and which has already been referred to more than once as the Annals of Lu. Its title is the Ch'un Chi, or "Spring and Autumn," the events of every year being digested under the heads of the four seasons, two of which are used by synecdoche for the whole. Mencius held that the composition of the Ch'un Chi was as great a work as Yu's regulation of the waters of the deluge with which the Shu King commences, and did for the face of society what the earlier labour did for the face of nature. This work also has been preserved nearly entire, but it is excessively meagre. The events of 242 years barely furnish an hour or two's reading. Confucius's annals do not bear a greater proportion to the events which they indicate than the headings and verses of the Greek Bibles bear to the contents of the chapters to which they are prefixed. Happily Tso K'iu-ming took it in hand to supply those events, incorporating also others with them, and continuing his narratives over some additional years, so that through him the history of China in all its states, from year to year, for more than two centuries and a half, lies bare before us. Tso never challenges the text of the master as being incorrect, yet he does not warp or modify his own narratives to make them square with it; and the astounding fact is, that when we compare the events with the summary of them, we must pronounce the latter misleading in the extreme. Men are charged with murder who were not guilty of it, and base murders are related as if they had been natural deaths. Villains, over whose fate the reader rejoices, are put down as victims of vile treason, and those who dealt with them as he would have been glad to do are subjected to horrible executions without one word of sympathy. Ignoring, concealing and misrepresenting are the characteristics of the Spring and Autumn Annals.

And yet this work is the model for all historical summaries in China. The want of harmony between the facts and the statements about them is patent to all scholars, and it is the knowledge of this, unacknowledged to themselves, which has made the literal labour with an astonishing amount of fruitless ingenuity and learning to find in individual words, and the turn of every sentence, some mysterious indication of praise or blame. But the majority of them will admit no flaw in the sage or his annals. His example in the book has been very injurious to his country. One almost wishes that critical reasons could be found for denying its authenticity. Confucius said that "by the Spring and Autumn men would know him and men would condemn him." It certainly obliges us to make a large deduction from our estimate of his character and of the beneficial influence which he has exerted. The examination of his literary labours does not on the whole increase our appreciation of him. We get a higher idea of the man from the accounts which his disciples have given us.
of his intercourse and conversations with them, and the attempts which they made to present his teachings in some systematic form. If he could not arrest the progress of disorder in his country, nor throw out principles which should be helpful in guiding it to a better state under some new constitutional system, he gave important lessons for the formation of individual character, and the manner in which the duties in the relations of society should be discharged.

Foremost among these we must rank his distinct enunciation of "the golden rule," deduced by him from study of man's mental constitution. Several times he gave that rule in express words:—"What you do not like when done to yourself do not do to others." The peculiar nature of the Chinese language enabled him to express this rule by one character, which for want of a better term we may translate in English by "reciprocity." When the ideagram is looked at, it tells its meaning to the eye. It is composed of two other characters, one denoting "heart," and the other—itself composite—denoting "as." Tze-kung once asked if there were any one word which would serve as a rule of practice for all one's life, and the master replied, yes, naming this character (公, shu), the "as heart," i.e. my heart in sympathy with yours; and then he added his usual explanation of it, which has been given above. It has been said that he only gave the rule in a negative form, but he understood it also in its positive and more comprehensive sense. It can be shown at least, that he had not himself always attained to taking the initiative in doing to others as he would have them do to him.

Another valuable contribution to ethical and social science was the way in which he inculcated the power of example, and the necessity of benevolence and righteousness in all who were in authority. Many years before he was born, an ancient hero and king had proclaimed in China: "The great God has conferred on the people a moral sense, compliance with which would show their nature invariably right. To cause them tranquilly to pursue the course which it indicates is the task of the sovereign." Confucius knew the utterance well; and he carried out the principle of it, and insisted on its application in all the relations of society. He taught emphatically that a bad man was not fit to rule. As a father or a magistrate, he might wield the instruments of authority and punish the transgressors of his laws, but noforthwithstanding his personal integrity the influence of his example. On the other hand, it only needed virtue in the higher position to secure it in the lower. This latter side of his teaching is far from being complete and correct, but the former has, no doubt, been a check on the "powers that be," both in the family and the state, ever since Confucius became the acknowledged sage of his country. It has operated both as a restraint upon evil and a stimulus to good.

A few of his more characteristic sayings may here be given, the pith and point of which attest his discrimination of character, and show the tendencies of his views:

"What the superior man seeks is in himself; what the small man seeks is in others."
"The superior man is dignified, but does not wrangle; social but not a partisan. He does not promote a man simply because of his words, nor does he put good words aside because of the man."
"A poor man who does not flatter, and a rich man who is not proud, are passable characters; but they are not equal to the poor who yet are cheerful, and the rich who yet love the rules of propriety."
"Learning, undigested by thought, is labour lost; thought unassisted by learning is pernicious." "In style all that is required is that it convey the meaning." "Extravagance leads to insubordination, and parsimony to meanness. It is better to be mean than insubordinate." "One can change his principles; principles do not change the man." That is, man is greater than any system of thought.
"The cautious seldom err." Sententious sayings like these have gone far to form the ordinary Chinese character. Hundreds of thousands of the literati can repeat every sentence in the classical books; the masses of the people have scores of the Confucian maxims, and little else of an ethical nature, in their memories,—and with a beneficial result.

Confucius laid no claim, it has been seen, to divine revelations. Twice or thrice he did vaguely intimate that he had a mission from heaven, and that until it was accomplished he was safe against all attempts to injure him; but his teachings were singularly devoid of reference to anything but what was seen and temporal. Man as he is, and the duties belonging to him in society, were all that he concerned himself about. Man's nature was from God; the harmonious acting out of it was obedience to the will of God; and the violation of it was disobedience. But in affirming this, there was a striking difference between his language and that of his own ancient models. In the King the references to the Supreme Being are abundant; there is an exciting awful recognition of Him as the almighty personal Ruler, who orders the course of nature and providence. With Confucius the vague, impersonal term, Heaven, took the place of the divine name. There is no glow of piety in any of his sentiments. He thought that it was better that men should not occupy themselves with anything but themselves.

There were, we are told in the Analects, four things of which he seldom spoke—extraordinary things, feats of strength, rebellious disorder and spiritual beings. Whatever the institutions of Chow prescribed about the services to be paid to the gods, and to the departed spirits, he performed reverently, up to the letter; but at the same time, one of the ministers of Lu asked him what constituted wisdom, he replied: "To give one's self earnestly to the duties due to men, and while respecting spiritual beings, to keep aloof from them,—that may be called wisdom."

But what belief underlay the practice, as ancient as the first footprints of history in China, of sacrificing to the spirits of the departed, Confucius would not say. There was no need, in his opinion, to trouble the mind about it. "While you cannot serve men," he replied to the inquiry of Tze-lu, "how can you serve spirits?" And what becomes of a man's own self, when he has passed from the stage of life? The oracle of Confucius was equally dumb on this question. "While you do not know life," he said to the same inquirer, "what can you know about death?" Doubts as to the continued existence of the departed were manifested by many leading men in China before the era of the Confucian philosopher. Tzen Kiu-ming, when men are swearing in the heat of passion, they sometimes pause and reflect on the validity of their oaths on the proviso that the dead to whom they appeal really exist. The "expressive silence" of Confucius has gone to confirm this scepticism.

His teaching was thus hardly more than a pure secularism. He had faith in man, man made for society, but he did not care to follow him out of society, nor to present him motives of conduct derived from the consideration of a future state. Good and evil would be recompensed by the natural issues of conduct within the sphere of time,—if not in the person of the actor, yet in the persons of his descendants. If there were any joys of heaven to reward virtue, or terrors of future retribution to punish vice, the sage took no heed of the one or the other. Confucius never appeared to give the evils of polygamy a thought. He mourned deeply the death of his mother; but no generous word ever passed his lips about woman as woman. Nor had he the idea of any progress or regeneration of society. The stars all shone to him in the heavens behind; none beckoned brightly before. It was no doubt the moral element of his teaching, springing out of his view of human nature, which attracted many of his disciples, and still holds the best part of the Chinese men of learning bound to him; but the conservative tendency of his lessons—nowhere so apparent as in the Ch'un Ch'iu—is the chief reason why successive dynasties have delighted to do him honour.

J. Le.

CONGÉ D'ÉLIRE (in Norman French, congé d'estére, leave to elect), a licence from the crown in England issued under the great seal to the dean and chapter of the cathedral church of the diocese, authorizing them to elect a bishop or archbishop, as the case may be, upon the vacancy of any episcopal or archiepiscopal see in England or in Wales. According to the Chronicles.
of Ingulphus, abbot of Crowland, who wrote in the reign of William the Conqueror, the bishopsric in England had been, for many years prior to the Norman Conquest, royal donations conferred by delivery of the ring and of the pastoral staff. Disputes arose for the first time between the crown of England and the see of Rome in the reign of William Rufus, the pope claiming to dispose of the English bishoprics; and ultimately King John, by his charter Ut liberae sunt electiones totius Anglieae (1214), granted that the bishops should be elected freely by the deans and chapters of the cathedral churches, provided the royal permission was first asked, and the royal assent was required after the election. This arrangement was confirmed by subsequent statutes passed in the reigns of Edward I. and Edward III. respectively, and the practice was ultimately settled in its present form by the statute Payment of Annates, &c., 1354. According to the provisions of this statute, upon the avoidance of any episcopal see, the dean and chapter of the cathedral church are to certify the vacancy of the see to the crown, and to pray that they may be allowed to proceed to a new election. The crown thereupon grants to the dean and chapter its licence under the great seal to elect a new bishop, accompanied by a letter missive containing the name of the person whom the dean and chapter are to elect. The dean and chapter are thereupon bound to elect the person so named by the crown within twelve days, in default of which the crown is empowered by the statute to nominate by letters patent such person as it may think fit, to the vacant bishopric. Upon the return of the election of the new bishop, the metropolitan is required by the crown to examine and to confirm the election, and the metropolitan's confirmation gives to the election its canonical completeness. In case of a vacancy in a metropolitan see, an episcopal commission is appointed by the guardians of the spiritualities of the vacant see to confirm the election of the new metropolitan. At one time deans of the "old foundation"—in contradistinction to those of the "new foundation," founded by Henry VIII. out of the spoils of the dissolved monasteries—were elected by the chapter on a cougò d'âtre from the crown, but now all deans are installed by letters-patent from the crown. (See Confirmation of Bishops.)

CONGLETON, HENRY BROOKE PARNELL, 1st BARON (1776-1842), was the second son of Sir John Parnell, bart. (1744-1801), chancellor of the Irish exchequer, and was educated at Eton and Cambridge. In 1801 he succeeded to the family estates in Queen's county, and married a daughter of the earl of Portarlington; and in 1802, by his father-in-law's interest, he was returned for Portarlington to parliament, but he speedily resigned the seat. In 1806 he was returned for Queen's county, for which he sat till 1832, when he withdrew from the representation. In 1833, however, he was returned for Dundeal and after being twice re-elected for the same city (1835 and 1837), he was raised to the peerage in 1841 with the title of Baron Congleton of Congleton. In 1842, having suffered for some time from ill-health and melancholy, he committed suicide. He was a Liberal Whig, and took a prominent part in the struggle of his party. In 1806 he was a commissioner of the treasury for Ireland; it was on his motion on the civil list that the duke of Wellington was defeated in 1830; in that year and in 1831 he was secretary at war; and from the 1831 till 1841 he was paymaster of the forces and treasurer of the ordnance and navy. He was the author of several volumes and pamphlets on matters connected with financial and penal questions, the most important being that On Financial Reform, 1830.

He was succeeded as 2nd baron by his eldest son John Vesey (1805-1883), who in 1829 joined the Plymouth Brethren, and spent his life in enthusiastic religious work. He left no son, and his brother Henry William (d. 1806) became 3rd baron, being succeeded by his second son Henry (1839-1906), a soldier who rose to be major-general.

CONGLETON, a market town and municipal borough in the Macclesfield parliamentary division of Cheshire, England, on the North Staffordshire railway, 1573 m. N.W. by N. of London. Pop. (1901) 10,707. It is finely situated in a deep valley, on the banks of the Dane, a tributary of the Weaver. To the east Cloud Hill, and to the south Mow Cop, rise sharply to heights exceeding 1000 ft. Congleton has no buildings noteworthy for age or beauty, save a few old timbered houses. The grammar school was in existence as early as 1553. In the 16th and 17th centuries the leather laces known as "Congleton points" were in high repute; but the principal industry of the town is now the manufacture of silk, which was introduced in 1752 by a Mr Pattison of London. Coal and salt are raised, and the other industries include fustian, towel, cloth, chair and nail factories, iron and brass foundries, stone quarries and corn mills. At Biddulph, 3 m. S., in a narrow valley, across the border in Staffordshire, are several coal-mines and iron-foundries. The gardens of the Grange here are celebrated for their beauty. Congleton is served by the Macclesfield canal. The borough is under a mayor, 6 aldermen and 18 councillors. Area, 2572 acres.

Congleton (Congulton) is not mentioned in any historical record before the Domesday Survey, when it was held by Hugh, earl of Chester, and rendered geld for one hide. In the 13th century, as part of the barony of Halton, the manor passed to Henry, earl of Lincoln, who by a charter dated 1282 declared the town "an island," a gild merchant and numerous privileges, including power to elect its own mayor and other officers. This charter was confirmed by successive sovereigns, with some additional privileges. In 1524 the burgesses were exempted from paying at the shire and hundred courts, and in 1533 the body corporate was reconstructed under the title of mayor and commonalty, and power was granted to make by-laws and to punish offenders. The governing charter, which held force until the Municipal Corporation Act of 1855, was granted by James I. in 1624, and instituted a mayor, 8 aldermen, 16 capital burgesses, a high steward, common-clerk and other officers. Charters were also granted by Charles II. and George IV. In 1823 Henry, earl of Lincoln, obtained a Saturday market and an eight days' fair at the feast of St Peter ad Vincula, and the market is still held under this grant. In 1314 a Tuesday market is mentioned, and a fair at the feast of St Martin. Henry VI. in 1430 granted to the burgesses a fair at the feast of SS. Philip and James. James I. confirmed the three existing fairs and granted an additional fair on the Thursday before Quinquagesima Sunday. Congleton suffered severely from the plagues of 1603 and 1641, and by the latter was almost entirely depopulated. On the whole, however, the town has steadily grown in population and commercial prosperity from the granting of its first charter.

See Victoria County History, Cheshire; Robert Head, Congleton Past and Present (Congleton, 1887); Samuel Yates, An History of the Ancient Town and Borough of Congleton (Congleton, 1820).

CONGLOMERATE (from the Lat. conglomerare, to form into a ball, glomus, glomeris; so also the general term "conglomer—" for a miscellaneous collection of things, gathered together in a mass), in petrology, the term used for a coarsely fragmental rock consisting of rounded pebbles set in a finer grained matrix. The pebbles must be rounded, otherwise the rocks are breccias, and these have a distinctly different geological significance. They have attained their present shapes by weathering and by attrition during transport by streams and the waves and currents of the sea. The pebbles consist mainly of hard rocks, such as granite, gneiss, sandstone, greywacke, or sometimes limestone. Conglomerates are commonly of great thickness, and are among the hardest and most durable of all rocks, and hence are specially abundant in conglomerates. Fragments of vein-quartz form a large part of the "banket-rock" of the auriferous Transvaal reefs, one of the most important conglomerates economically. In this case the matrix consists mainly of quartz and chlorite, and gold occurs both in the matrix and in the pebbles. Igneous rocks on account of their toughness are also very abundant in many conglomerates; those at the base of the Old Red Sandstone of Scotland, which are thousands of feet in thickness, consist largely of andesite, porphyrite, granite, diorite and porphyry, along with vein-quartz, quartzite and various kinds of gneiss. Soft and friable rocks, on the other hand, such as shale, mica-schist and coal, are rarely found in any quantity.
as pebbles in conglomerate-beds. They are ground to pieces by friction against harder masses and help to form the matrix. The size of the pebbles varies greatly; occasionally they are 10 or 20 ft. in diameter, more frequently they are a foot or less. The cementing matrix in which the pebbles are embedded usually bears some resemblance in composition to the nature of the pebbles, but contains a larger proportion of the softer ingredients, such as clay, mica, weathered felspar, calcite and dolomite. Often it resembles a felspathic or calcareous sandstone; if limestone fragments are common it may be highly calcareous, or may be in large measure dolomitic. Often the matrix is stained red by compounds of iron. The "brockram" of the north of England is a well-known Permian limestone-conglomerate. The Dolomitc Conglomerate is a similar rock, but of Triassic age. Both of these are often extensively dolomitized and pass into breccias, where their fragments are angular and unworked. The pebble beds of the Bunter (Triassic period) are also familiar to geologists. They cover extensive areas in the midlands of England, and are well seen at Budleigh Salterton on the south coast. The pebbles are mostly quartzite with granite, chert, sandstone and igneous rocks.

Conglomerates are rarely well bedded, showing at most a rude stratification, but they may contain intercalations of finer materials such as sandstone and shale, which indicate the bedding clearly. In these fossils may be found, but they do not often occur in the conglomerates themselves, as the conditions are generally unsuitable for the preservation of organic remains. The pebbles, however, may be highly fossiliferous, and sometimes important evidence is provided by these remains to the age of the conglomerate. On account of the imperfect stratification it is often very hard to estimate the thickness of conglomerates, and this difficulty is increased by the fact that many of them must have been laid down as sloping banks of pebbles and not as flat layers of deposit. Conglomerates are generally consolidated gravels, and have originated mostly on seashores or in shallow waters near land. They are typical shore formations, and are especially frequent where one series of stratified rocks rest upon an older group unconformably. Other conglomerates occur along with fine-grained red sandstones, salt beds and such rocks as accompany desert deposits. We may compare them with the accumulations of pebbles which cover extensive areas of existing deserts. A quite distinct group of conglomerates characterizes regions where the rocks are much broken and sheared; these may very closely resemble true conglomerates, but have really been produced by the mashing together of rock masses along zones of fracture and movement. They are known as "crush-conglomerates" or "auto-clastic rocks." Conglomerates may undergo metamorphism, and are then converted into "conglomerate-geiss" or "conglomerate-chert." Their pebbles are flattened and dragged out of shape by interstitial movement, while the matrix becomes highly crystalline. One of the best-known examples of this is the Obermittleweida geiss (Saxony). (J. S. F.)

CONGO, formerly known as Zaire, the largest of the rivers of Africa, exceeded in size among the rivers in the world by the Amazon only. The Congo, though it has a shorter course than the Nile, has a length of fully 3,000 m. and a drainage area estimated at 1,425,000 sq. m., with a diameter of some 100 m. either way. This vast area includes the equatorial basin of Central Africa and much of the surrounding plateaux. West and north the Congo basin is bounded by comparatively narrow bands of higher ground, while east and south the drainage area of the river includes considerable portions of the high plateaux of east and south Central Africa. The main drainage of the Congo system is thus north and west, and these two directions dominate the great bow-like sweep of the main stream before it is deflected south on approaching the western highlands, through which it finally forces a way to the Atlantic Ocean. From the high lands of the south and east in which the head-streams of the Congo have their origin, the land falls in a succession of steps, generally marked by gorges or rapids in the upper courses of the streams. Besides the main stream most of the affluents of the river are navigable for considerable distances; in all there are over 6,000 m. of navigable water in the Congo basin and 20,000 m. of overhanging wooded banks. On the Congo alone are over 4,000 islands many of considerable length—some fifty of them are over ten miles long. The volume of water pouring into the Atlantic is at least 1,200,000 cubic ft. per second.

Head-Streams.—The most distant head-streams of the Congo are far to the north and east of those most to the south, and it is difficult to determine which stream is the "parent" river. The easterly head-streams are, however, regarded generally as marking the true course of the Congo. The most remote of these rivers is the Chambezi, which, with its tributaries, rises (in British territory) on the southern slope of the plateau between lakes Nyasa and Tanganyika at an elevation of about 6,000 ft. The watershed is formed by the crest of the plateau, and is perfectly distinguishable, save at a spot called Itomb, about half-way between the lakes, where is a swamp which drains to both the Atlantic and the Indian oceans. The Chambezi source is in 0° 6' S., 31° 20' E. Its chief tributary, the Karungu, rises in 0° 59' S., 33° 2' E. The Choa, an affluent of the Karungu, rises in 0° 59' S. and joins the Chambezi, about half a degree to the east of that stream. After the junction the Karungu and Chambezi the river flows in a south-western direction through a fairly fertile country, and receiving many tributaries becomes a large river with steep wooded banks and many islands. Its width varies greatly, from 30 yds. to 2 m. in a comparatively short distance; its depth is rarely less than 1 ft. In its lower course the Chambezi passes through papyrus marshes, and dividing into several channels, enters the vast swamp which forms the southern part of Lake Bangweulu (q.v.). The large river, known as the Luapula (Great River), which issues from Bangweulu in 11° 31' S. and runs south through this swamp, may be regarded as a continuation of the Chambezi, there being a channel from the one stream to the other. The Luapula on leaving the swamp bends west and then south—reaching 14° 25' S.—and approaches the watershed of the Zambesi, receiving several southern tributaries. The source of its most southern affluent, and therefore the most southern point in the Congo basin, is approximately in 15° 35' S. Turning north the Luapula precipitates itself down the Mambutii (or Mambirimia) Falls (12° 17' S., 29° 15' E.), the thunder of which can be heard on a still night for 8 or 9 m. The river, the width of which varies from 230 to 1,200 yds., is almost un navigable until below the Johnston Falls (Mambilima of the natives), a series of rapids extending from 11° 10' to 11° 30' S. Below the falls the river is navigable by steamer all the way to Lake Mweru—a distance of 100 m. Before entering Mweru (q.v.) the Luapula again passes through a swampy region of deltaic character, a great part of the water escaping eastwards by various channels, and after spreading over a wide area finally passing into Mweru by lagoon-like channels east of the main Luapula mouth. From Bangweulu to Mweru the fall of the river in a total distance of 330 m. is about 700 ft. The river (known now as the Luvua) makes its exit at the N.W. corner of the lake, and bending westwards in a winding course, passes, with many rapids, across the zone of the Kebara and Mugila mountains, falling during this interval nearly 1,000 ft. In about 6° 45' S., 26° 50' E. it crosses the Kamolondo (otherwise Luapula) the western main branch of the Congo, which, as it flows in a broad level valley at a lower level than the eastern branch, is held by some to be the true head-stream. The Kamolondo is formed by the junction of several streams having their source on the northern slope of the south-central plateau as it dips towards the equatorial basin. This escarpment contains many heights exceeding 6,000 ft. The streams flowing south from it belong to the Zambesi basin, but the watershed is not everywhere clearly defined. Thus the Lumpemba (an affluent of the Lokulesi, one of the main tributaries of the Luabu) rises in 11° 24' S., 24° 28' E., 3 m. S.
and 6 m. E. of the source of the Zambezi, both streams running a parallel course northward for some 15 m. There is, however, no connexion between the Zambezi and Congo systems. The Luabala, also known as Nzilo, which is the main stream of the Kamolondo, rises at an altitude of 4500 ft., in 26° 40' E., just north of 12° S.—the watershed of the western head-streams of the Congo being everywhere north of that parallel. East of the Luabala—between it and the Luapula—rises the river Lufira. With many windings the Luabala and Lufira pursue a generally northerly direction, passing through the Mitumba range in deep gorges, their course being broken by rapids for 40 or 50 m. Below Konde Rapids in 0° 20' S. the Lufira joins the Luabala and together they form the Eastern tributaries to the Kamolondo; in one of these marshy lakes—Kisale—through which there is a navigable channel. The river issuing from Lake Kisale is known as Kamolondo; it has a width varying from 300 to 1000 ft. and an average depth of 10 ft. From Konde Rapids to those of Dia in 5° 20'—a distance of 300 m.—there is no interruption to navigation saving the floating masses of vegetation on Kisale at high water. The region watered by these western head-streams of the Congo includes Katanga and other districts, which are among the most fertile and densely populated in Belgian Congo.

The Upper Congo or Luabala.—After the junction of the Luapula (Luvua) and the Luabala (Kamolondo) the united stream, known as the Luabala or Luabala-Congo, and here over half a mile wide, pursues a N.W. course towards the equator. The Dia Rapids, already mentioned, are the first obstruction to navigation encountered. A mile or two lower down the Luabala passes through a narrow gorge called the Porte d'Enfer. From this point as far north as 3° 10' S. the course of the river is interrupted by falls and rapids, the chief being the rapids (in 3° 35' S.) below the Arab settlement of Nyangwe and those at Sendwe in 3° 15' S. In this part of its course the Congo becomes a majestic river, often over a mile wide, with flat wooded banks, the only real impediments to navigation being the Dia Rapids and Stanley Falls being those named. Between the junction of the two main upper branches, about 1700 ft. above the sea, and the first of the Stanley Falls (1320 ft.), the fall of the river is less than 200 ft., in a distance of 500 m. During the whole of this section the Luabala receives the most of its tributaries from the east. Of these, the Lukuga connects Lake Tanganyika with the Congo system. The Lukuga (see TANGAN-YIKA) drains the mountainous country through which it passes, and also, intermittently, receives the overflow waters of Tanganyika. The outlet from the lake is sometimes clear, sometimes silted up. The Lukuga is much broken by rapids, falling 1000 ft. during its course of some 300 m. Farther north are a number of streams which drain the forest region between 4° S. and the equator, the Lubamba, the Ella or Lira, the Luuleni and the Loa being the most important. These streams lie on an upland region west of the Albertine rift-valley. The Luindi in its middle course has a general width of 60 to 100 yds., but the Loa is larger, receiving two important affluents, the Luvufo from the north and the Kasko which rises in the mountains at the N.W. end of Lake Kivu. The lower course of the Luindi is very tortuous.

Stanley Falls.—Stanley Falls, which mark the termination of the upper Congo, begin a few miles south of the equator. At this point the river forsakes the northerly course it has been pursuing and sweeps westward through the great equatorial basin. The falls consist of seven cataracts extending along a curve of the river for nearly 60 m. They are not of great height—the total fall is about 200 ft.—but they effectually prevent navigation between the waters above and those below except by canoes. The first five cataracts are near together; only 9 m. separate the first from the fifth. The sixth cataract is 22 m. lower down, and the seventh, the most formidable of all the cataracts, is 26 m. below the sixth. The fall, divided into two portions by an islet, is 800 yds. wide. The channel is narrowed at the foot of the fall to some 450 yds. by an island close to the left bank; on the right bank of the river is the island of Wane Rusari (2 m. long by ½ m. broad), separated from the mainland by a channel 30 yds. wide. The fall is only about 10 ft.; but the enormous mass of water, and the narrow limits to which it is suddenly contracted, make it much more imposing than many a far loftier cataract. Small rapids mark the course of the river for another 2 m.

The Middle Congo.—Below Stanley Falls the Congo is unbroken by rapids for 980 m., and is navigable throughout this distance all the year round. The river here makes a bold north-westely

![Map of Congo](https://example.com/congo_map.png)
CONGO

found the largest islands of the Congo—Esumba, 30 m. long, and Nsumba, 30 m. long, and over 5 across at its broadest part. At this point the river from bank to bank is 9 m. wide. Opposite Nsumba, the Mongala, a northern affluent, enters the main stream, whilst lower down (just north of the equator) the Lualunga, Ikelemba and Ruki rivers, southern tributaries, mingle their black waters with the dark current of the Congo. Thirty miles south of the equator the river is joined by the Ubangi (g.e.), its greatest northern affluent. Here the Congo is fully 8 m. wide. Opposite the Ubangi confinement is the mouth of a narrow channel, some 10 m. long, which connects the Congo with Lake Ntomba, a sheet of water about 23 m. long by 8 to 12 broad. In flood time the water flows from the Congo into the lake. Immediately below ferruginous conglomerate hills of slight eminence reduce the river to a width of less than 2 m., and in comparatively close succession are two or three other narrows. With these exceptions the Congo continues at a width of 5 to 6 m. until at 2° 36' S. it abruptly contracts, being confined between steep-faced hills rising to 800 ft. This stretch of the river, known as the "Chenal," is 125 m. long and is free from islands, though long reefs jut into the stream. Its width here varies from 2 m. to less than 1 m. About 40 m. after the Chenal is entered the Kasai (g.e.) coming from the south empties its brick-coloured waters at right angles into the Congo. Here through the only serious rapids in the river, the confinement is known as the Kwa mouth. The Chenal ends in the lake-like expansion of Stanley Pool, 20 m. long by 14 broad. The middle of the pool is occupied by an island (Bamu) and numerous sandbanks. Its rim is "formed by sieras of peaked and picturesque mountains, ranging on the southern side from 1000 ft. to 3000 ft. in height." The banks offer considerable variety in character. On the north bank are the Dover Cliffs, so named by H. M. Stanley from their white and glistening appearance, produced, however, not by chalk but by silurian sand, the subsidence of which into the water renders approach to the bank sometimes dangerous. The banks of the lower end of the pool are comparatively flat. On the south side, however, stands the great red cliff of Kallina Point (about 50 ft. high), named after an Austrian lieutenant drowned there in 1882. Round the point rushes a strong current 7 ½ knots an hour, difficult to stem even for a steamer. On the northern bank of the river at the western end of the pool is the French port of Brazzaville. South of the pool hills, low but steep, reappear, and 4 m. lower down begin the cataracts which cut off the middle Congo from the sea. Some of these cataracts are the Beni, the port of Leopoldville, connected with the navigable waters of the lower river by railway. At Stanley Pool the elevation of the river above the sea is about 800 ft., a fall of over 300 ft. in the 980 m. from Stanley Falls. The banks of the river throughout this long stretch of country are very sparsely populated. The number of inhabitants in 1902 did not exceed 125,000.

The velocity of the stream in the middle Congo varies considerably. At the Aruwimi confluence the rate is from 300 to 350 ft. a minute; in the broader stretches lower down the current is not more than 200 ft. a minute. Through the Chenal the pace is greatly accelerated, and as it flows out of Stanley Pool the current is not less than 600 ft. a minute.

The Lower Congo.—The cataracts below Stanley Pool are caused by the river forcing its way through the mountains which run parallel to the western coast of the continent. The highlands (known as the Serro do Cristal) consist of two principal mountain zones with an intermediate zone of lower elevation. The passage of this intermediate zone is marked by a fairly navigable stretch of river extending from Manyanga to Isangila, a distance of 76 m., during which the level drops about 200 ft.; and above and below rapids succeed each other at short intervals. Some eighteen main rapids or falls occur during the upper section (87 m.), in the course of which the level drops about 300 ft.; and about ten in the lower section (56 m.), during which the fall is about 300. The last rapid is a little above the port of Matadi, beyond which the river is navigable for large vessels to the sea, a distance of about 85 m. At Matadi the tall cliffs on either side sink away and the river widens out into an estuary with many mangrove-bordered creeks and forest-clad islands of a deltaic character. This estuary is traversed by a deep cañon, in which soundings of 900 ft. have been obtained. The mouth of the river is in 6° S. and 9° 20' E. The cañon or gully is continued into the open sea for over 100 m., with depths as much as 4000 ft. below the general level of the sea floor. Just below Matadi, where the width of the river is about half a mile, depths of 276 and 360 ft. have been found, the current here running at from 4 to 8 knots, according to the season; while the difference in level between high and low water is 20-25 ft. The difference in level is not due to tidal action but is caused by the rainy or dry seasons, of which there are two each during the year. In the middle Congo May and November are the times of greatest flood; in the lower river the floods are somewhat later. At Stanley Pool the maximum rise of water is about 15 ft. The tides are felt as far as Boma, 49 m. from the mouth of the river, but the rise is there less than a foot; while at the mouth it is 6 ft. The cañon above mentioned is occupied by salt water, which is nearly motionless. Above it the fresh water runs with increasing velocity, but decreasing depth, so that just within the mouth of the river it is only a few feet deep.

The river at its mouth between Banana Point on the north and Sharks Point on the south is over 7 m. across. Banana Point (which grows no bananas) is the end of a long sandy peninsula, its highest spot not more than 6 ft. above high water; Sharks Point is bolder and shaped somewhat like a reaping-hook with the point turned inward, thus enfolding Diegos Bay. The current of the river is perceptible fully 30 m. out to sea, the brown waters of the Congo being distinguishable from the blue of the ocean.

Northern Tributary Rivers.—The various head-streams and affluents of the upper Congo have been already described. Below Stanley Pool numerous streams with courses of 100 or more miles drain the Crystal Mountains and join the Congo. They are unnavigable and comparatively unimportant. There remain to consider the affluents of the middle river. Of these the most important, the Ubangi on the north and the Kasai on the south, with their tributary streams, are noticed separately. In dealing with the other affluents of the Congo those entering the river on the right bank will be considered first.

The Lindi enters the Congo about 15 m. below Stanley Falls in 25° 4' E. The falls rise in 1° 26' N., 26° 46' E. Below it the river is in a tortuous course. Below the Lindi Falls in 2° 20' N., 26° 6' E. it is navigable, a distance of over 100 m. A mile or two above its confluence with the Congo it joins by the Chopo, a more southerly and less important stream. The basins of these two rivers do not extend to the outer Congo watershed, but the next feeder, the great Aruwimi, rises, as the Ituri, in close proximity to Albert Nyanza, flowing generally from east to west. It is formed of many branches, including the Nepoko from the north, and its upper basin extends over 23° of latitude. The upper river, to about 27° E., is much broken by rapids, but apart from those of Yambuya in 24° 47' the lower river is nearly free from obstructions. To Yambuya, the limit of navigation from the mouth of the Aruwimi, is a distance of over 90 m. The Aruwimi flows almost entirely through the great equatorial forest, which here seems to reach its maximum density. Its confluence with the Congo is in 1° 12' N., 23° 38' E. On its north bank just above the mouth is the station of Basoko. The next tributary, known as the Loika, Itimbiri or Lubi river, rises in about 26° E., and, flowing generally west, joins the Congo by two mouths, 26° 35'-36° E. The Loika is navigable by steamers as far as the Lubi Falls, a distance of 150 m. The Mongala, the next great tributary to join the Congo, drains the country between the Loika to the east and the Ubangi to the west. It rises in about 3° N., 23° 20' E., and flows in a somewhat similar curve (on a smaller scale) to that of the Ubangi. The Mongala is navigable for over 300 m., and gives access to a fertile rubber-producing region. The Mongala confluence lies in 1° 53' N., 19° 49' E. Below the Ubangi confluence the Sanga, in 1° 12' S., 16° 53' E., joins the Congo. The Sanga rises in the north-west verge of the Congo.
basin and flows in a general north to south direction. Its lower course is tortuous, as it flows across level, often swampy, plains. The main northern branch rises in southern Adama in about 7° N., 15° E. An almost equally large western branch, the Dscha (or Ngoko), rises in about 3° N., 133° E., and after flowing W. for 100 m. makes a sudden bend S.E., joining the main stream in 5° 40' N., 16° E. In its course it traverses a vast tract of uninhabited forest. The Sanga is navigable by steamers as far as the south-east corner of the German colony of Cameroon, a distance of 350 m. The Likuala and Alima, which join the Congo within 30 m. of the mouth of the Sanga, are much smaller streams. The Léfini (mouth in 2° 57' S., 16° 14'E.) is the last stream of any size to join the Congo above Stanley Pool.

Southern Tributaries.—The first of the southern tributaries of the middle Congo, the Lomami, enters the main stream in 0° 46' N., 24° 16' E. It has a length of over 700 m., rising in nearly 9° S. It flows S. to N., the greater part of its course being parallel to and from 40 to 150 m. west of the upper Congo. It is comparatively narrow and tortuous, but deep, with a strong current, and is hardly broken by rapids north of 43° S. About 3° S. it traverses the region of swamps which may have given rise to the reports once current of a great lake in this locality. For the last 200 m. it is navigable by steamers. Below the mouth of the Lomami there is a long stretch with no southern tributary, as the great plain within the Congo bend is drained by streams flowing in the same direction as the middle Congo—east to west. The Lulanga (or Lulongo), about 400 m. long, enters in 0° 40' N., 18° 16' E. Its northern branch approaches within 20 m. of the Congo in its upper course. The main branch of the Ruki or Juapa, which enters a little north of the equator in 18° 21'E., has its rise between 24° and 25° E. and about 3° S., in the swampy region traversed by the Lomami. On account of the colour of its water it was named by H. M. Stanley the Black river. It is about 600 m. long and has two large southern tributaries. A few miles above the Ruki confluence the Ikelamba (some 150 m. in length) joins the Congo. The three rivers, Lulanga, Ikelamba and Ruki, and their sub-streams, have between them over 1000 m. of navigable waters. No rapids intercept their course.

Exploration.—Unlike the Nile there are no classic associations with the Congo. A single mention made of the Zaïre by Camoens in the Lusiads exhausts its connexion with literature (up to the beginning of the 19th century), other than in little known and semi-fabulous accounts of the ancient kingdom of Congo. The mouth of the river was discovered by the Portuguese naval officer Diogo Cão or Cam either in 1482 or 1483. To mark the discovery and to claim the land for the Portuguese crown he erected a marble pillar on what is now called Sharks Point. Hence the river was first called Rio de Padrão (Pillar river). It soon, however, became known as Zaïre (q.v.), a corruption of a native word meaning "river," and subsequently as the Congo. In the three centuries succeeding Diogo Cão's discovery strangely little was done to explore the river. At length the British Admiralty took action, and in 1816 despatched Captain J. K. Tuckey, R.N., at the head of a well-equipped mission. The expedition was accompanied by the successful entry of the Congo was identical with the Niger. So slight was the knowledge of the river at that time that the only chart with any pretension to accuracy did not mark it farther than 130 m. from the mouth, a state of affairs, in the opinion of the admiral, "little creditable to those Europeans who for nearly three centuries have occupied various parts of the coast" near the river's mouth. Captain Tuckey's expedition reached the mouth of the Congo on the 6th of July 1816, and managed to push up stream as far as Isangila, beyond the lowest series of rapids; but sickness broke out, the commander and sixteen other Europeans died, and the expedition had to return. Captain Tuckey and several of his companions are buried on Prince's Island, just above Boma, the point where the Congo widens into a estuary. A detailed survey of the first 25 m. of the river was effected in 1826 by the "Levin" and the "Barracouta" belonging to Captain (subsequently Vice-Admiral) W. F. W. Owen's expedition; in 1857 Commander J. Hunt, of the "Alecto," made an attempt to ascend the river, but only reached the cataracts. Captain, afterwards Sir Richard, Burton attained the same limit in 1863, and also proceeded inland as far as Zanza Noki (São Salvador). In November 1872 an expedition under Lieutenant W. Grandy, R.N., was despatched from England for the purpose of advancing from the west coast to the relief of David Livingstone. So little was the Congo known, however, that Ambiz was chosen as the starting-point, and the expedition marched overland. After many vicissitudes Lieutenant Grandy had to retrace his steps. He reached, late in 1873, on the Congo below the cataracts and intended thence to push his way up stream. The death of Livingstone was soon afterwards reported; and in April 1874, just as Grandy was preparing to ascend the river, letters of recall brought the expedition to a close.

It was by working down from its source that the riddle of the Congo was finally solved. In 1868 David Livingstone traced the course of the Chambézi to Lake Bangweulu. In March 1871 he reached the town of Nyangwe on the Luulaba, and died (1873) whilst endeavouring to trace the head-streams of that river, which he believed to be the Nile. "I have no fancy," he once said, "to be made into 'black man's pot' for the sake of the Congo." Livingstone's views were not shared by the scientific world, and as early as 1872 geographers were able to affirm from Livingstone's own reports that the great river system he had explored in the region north of the Zambezi must belong to the Congo and not to the Nile. Actual proof was lacking, and of the course of the main river there was absolute ignorance. But in October 1876, H. M. Stanley arrived at Nyangwe from Zanzibar and from that point navigated the river over 1600 m. to Isangila—"Tuckey's Furthest"—reached in July 1877, thus demonstrating the identity of the Lulaba with the Zaïre of the Portuguese. Stanley's great journey marked an epoch in the history of Africa, politically and commercially as well as geographically. Of the many travellers who followed Stanley in the Congo basin none did more to add to the exact knowledge of the main river and its greatest tributaries—the Ubangi, the Kasai and the Lomami—than the Rev. George Grenfell (1849-1906) of the Baptist Missionary Society. The Auruwimi was partly explored by Stanley in 1887 in his last expedition in Africa, and was further examined by Grenfell in 1894 and 1902. The western head-streams were largely known by the Belgians, Capt. C. Lemaire and A. Delacommune, the last-named also mapping the upper Lomami and the Lukuga. (See also Ubangi; Kasai; Livingston and Stanley.)
The International Association for the Exploration and Civilization of Africa. To carry out its objects an international commission was founded, with committees in the principal countries of Europe. The Belgian committee at Brussels, where also were the headquarters of the International commission, displayed from the first greater activity than did any of the other committees. It turned its attention in the first place to East Africa, and several expeditions were sent out, which resulted in the founding of a Belgian station at Karembe on Lake Tanganyika. But the return of Mr (afterwards Sir) H. M. Stanley from his great journey of exploration down the Congo forcibly directed the attention of King Leopold to the possibilities for exploration and civilization offered by the Congo region. On the invitation of the king, Mr Stanley visited Brussels, and on the 25th of November 1878 a separate committee of the International Association was organized at Brussels, under the name "Comité d'études du Haut Congo." Shortly afterwards this committee became the "International Association of the Congo," which in its turn was the forerunner of the Congo Free State. The Association was provided with a nominal capital of £40,000, but from the first its funds were largely supplemented from the private purse of King Leopold. A careful plan was worked out for the evolution of the Congo, which was originally, in name at least, international in character, became a purely Belgian enterprise. Mr Stanley, as agent of the Association, spent four years in the country, founding stations and making treaties with various chiefs. The first station was founded in February 1880 at Vivi, and before returning to Europe in August 1884 Mr Stanley had established twenty-two stations on the Congo and its tributaries. Numerous expeditions were organized by King Leopold in the Congo basin, and the activity of the International Association and its agents began seriously to engage the attention of the European powers interested in Africa. On behalf of Portugal, claims were advanced to the Congo, based on the discovery of its mouth by Portuguese navigators centuries before. In the interests of France, M. de Brazza was actively exploring the northern banks of the Congo, and had established various posts, including one where the important station of Brazzaville is now situated. The fact that the International Association of the Congo had no admitted status as a sovereign power rendered it more of its acquisition somewhat belated and involved King Leopold in determined efforts to secure for his enterprise a recognized position. Early in 1884 a series of diplomatic events brought the question to a head. The 2nd Earl Granville, then British foreign secretary, in February of that year concluded a convention with Portugal, recognizing both banks of the mouth of the Congo as Portuguese territory. This convention was never ratified, but it led directly to the summoning of the Berlin Congress in 1884–1885, and to the recognition of the International Association as a sovereign state.

The United States of America was the first great power, in a convention signed on the 22nd of April 1884, to recognize the Association as a properly constituted state. Simultaneously, King Leopold had been negotiating with the French government, the Association's most serious rival, not only to obtain recognition but on various boundary questions, and on the 3rd of April 1884 Colonel M. van Eetvelde, administrator-general of the foreign affairs of the Congo State, informed the French minister at Brussels that the International Association had not intended in 1884 that the right of preference accorded to France could be opposed to that of Belgium; and on the 29th of April the French minister took note, in the name of the French government, of this interpretation of the right of preference, in so far as such interpretation was not contrary to pre-existing international engagements. Germany was the next great power after the United States to recognize the flag of the International Association as that of a friendly state, doing so on the 8th of November 1884, and the same recognition was subsequently accorded by Great Britain on the 16th of December; Italy, 19th of December; Austria-Hungary, 24th of December; Holland, 27th of December; Spain, 7th of January 1885; France and Russia, 5th of February; Sweden and Norway, 10th of February; Portugal, 14th of February; and Denmark and Belgium, 23rd of February. While negotiations with Germany for the recognition of the status of the Congo Free State were in progress, Prince Bismarck issued invitations to the powers to an international conference at Berlin. The conference assembled on the 15th of November 1884, and its deliberations ended on the 26th of February of the following year by the signature of a General Act, which dealt with the relations of the European powers to other regions of Africa as well as the Congo basin. The provisions affecting the Congo were specified in a special convention. A geographical basin of the Congo was declared to be proclaimed, which comprised all the region above the mouth of the Congo and its affluents, including Lake Tanganyika, with its eastern tributaries, and in this conventional basin it was declared that "the trade of all nations shall enjoy complete freedom." Freedom of navigation of the Congo and all its affluents was also secured, and differential dues on vessels and merchandise were forbidden. Trade monopolies were prohibited, and provision made for civilizing the natives, the suppression of the slave trade, and the protection of missionaries, scientists and explorers. Provision was made for the powers owning territory in the conventional basin to proclaim their neutrality. As regards navigation, only such taxes or duties were to be levied as had "the character of an equivalent for services rendered to navigation itself"; and it was further provided that (Article 16) "The roads, railways or lateral canals which may be constructed with the special object of obviating the inanniability or correcting the imperfection of the river route on certain sections of the course of the Congo, its affluents, and other waterways, placed under a Crown or State, shall be subject to the scrutiny of the Powers concerned, in their quality of means of communication, as dependencies of this river and as equally open to the traffic of all nations. And as on the river itself, so shall there be collected on these roads, railways, and canals only tolls calculated on the cost of construction, maintenance, and management, and on the profits due to the promoters"; while as regards the tariff of these tolls, strangers and natives of the respective territories were to be treated "on a footing of perfect equality." The International Association not having possessed, at the date of the assembling of the Conference, any recognized status, was not formally represented at Berlin, but the flag of the Association having, before the close of the conference, been recognized as that of a sovereign state by all the powers, with the exception of Turkey, the Association formally adhered to the General Act. Thus early in 1885 King Leopold had secured the recognition of the Association as an independent state, but its limits were as yet not clearly defined. On the 5th of February, as the result of prolonged negotiations, France conceded the right of the Association to the course of the lower Congo below Manyanga, and accepted the Chiloango river and the water-parting of the waters of the Niadi Kwili and the Congo, as far as beyond the meridian of Manyanga, as the boundary between her possessions and those of the Association on the lower river. From Manyanga the frontier was to follow the Congo up to Stanley Pool, the median line of Stanley Pool, and the Congo again "up to a point to be settled above the river Licona-Nkundja," from which point a line was to be drawn to the 17th degree of longitude east of Greenwich, following as closely as possible the water-parting of the Licona-Nkundja basin. The identity of the Licona-Nkundja
subsequently gave rise to considerable discussions with France, and eventually a protocol, signed at Brussels on the 29th of April 1887, continued the boundary along the Congo to its confluence with the Ubangi (Mobangi), whence it followed the thalweg of that river to its intersection with the 4th parallel of north latitude, below which parallel it was agreed that the northern boundary of the Congo Free State should in no case descend. In accepting this frontier King Leopold had sacrifice all claims to the valley of the Niadi Kwili, in which he had founded fourteen stations, and to the right bank of the Ubangi. With Portugal the Association concluded an agreement on the 14th of February 1885, by which the northern bank of the Congo was recognized as belonging to the Association, while Portugal retained the southern bank of the river as far as Noki. North of the Congo Portugal retained the small enclaves of Kabinda, while south of the river the frontier left the Congo at Noki and followed the parallel of that place to the Kwango river.

In April 1885 the Belgian chamber authorized King Leopold “to be the chief of the state founded in Africa by the International Association of the Congo,” and declared that “the union between Belgium and the new State of the Congo shall be exclusively personal.” This act of the Belgian legislature revealed the position of King Leopold, who at once began the work of organizing an administration for the new state. In a circular letter addressed to the powers on the 1st of August 1885 His Majesty declared the neutrality of the “Independent State of the Congo,” and set out the boundaries which were then claimed for the new state. At the date of the issue of the circular the agreements with France and Portugal had partially defined the boundaries of the Free State on the lower river, and the 30th degree of longitude east of Greenwich was recognized as the limit of its extension eastwards.

The following is a list of the agreements subsequently made with reference to the boundaries of the state (see also Africa, §3):

1. 22nd of November 1885, with France.—Protocol for delimitation of the Manyanga region.
2. 29th of April 1887, with France.—Protocol for delimitation of the Ubangi region.
3. 25th of May 1891, with Portugal.—Treaty for delimitation of the Lunda region, and convention of even date for the settlement of officers on lower Congo.
4. 24th of March 1894, with Portugal.—Declaration approving delimitation of Lunda region.
5. 12th of May 1894, with Great Britain.—Agreement as to Nile valley and the territories in Central Africa.
6. 14th of August 1894, with France.—Agreement as to Mbomu river, and Congo and Nile basins.
7. 5th of February 1895, with France.—Agreement as to Stanley Pool.
8. 9th of May 1906, with Great Britain.—Agreement as to territories leased in 1894 in the Nile valley.

The net result of the above agreements was to leave the Congo Free State with France, Portugal and Great Britain as her neighbours on the north, with Great Britain and Germany as her neighbours on the east, and with Great Britain and Portugal on her southern frontier. The main object of King Leopold’s ambition was to obtain an outlet on the Nile, and for the history of the incidents connected with the two important agreements made in 1894 with Great Britain and France, and their sequel in the agreement made with Great Britain in 1906, reference must be made to the article Africa, §5. The expenditure necessitated by the efforts of the king to attain his object involved a heavy strain on the finances of the state, reacting on its internal policy. The avowed object of the Free State was to develop the resources of the territory with the aid of the natives, but it early became apparent that the Arabs slave-traders, who had established themselves in the country between Lake Tanganyika and Stanley Falls and on the upper river, opposed a serious obstacle to the realization of this programme. The scanty resources at the disposal of the state imposed a policy of restraint on the officers who were brought into relations with the Arabs on the upper river, of whom Tippoo-Tib was the chief. In 1886 the Arabs had destroyed the state station at Stanley Falls, and it was apparent that a struggle for supremacy was inevitable. But the Free State was at that time ill prepared for a trial of strength, and at Mr Stanley’s suggestion the bold course was taken of appointing Tippoo-Tib governor of Stanley Falls, as the representative of King Leopold. This was in 1887, and for five years the modus vivendi thus established continued in operation. During those years fortified camps were established by the Belgians on the Sankuru, the Lomami, and the Arumivi, and the Arabs were quick to see that each year’s delay increased the strength of the forces against which they would have to contend. In 1891 the imposition of an export duty on ivory excited much ill-will, and when it became known that, in his march towards the Nile, van Kerckhoven had defeated an Arab force, the Arabs on the upper Congo determined to precipitate the conflict. In May 1892 the murder of M. Hodister, the representative of a Belgian trading company, and of ten other Belgians on the upper Lomami, marked the beginning of the Arab war. When the news reached the lower river a Belgian expedition under the command of Commandant (afterwards Baron) Dhanis was making its way towards Katanga. This expedition was diverted to the east, and the fighting began in the lower Kasai in November 1892. Three months later, during which several battles were fought and the Arab strongholds of Nyangwe and Kasongo were captured, the Arab power was broken and many of the leading Arabs were killed. The political and commercial results of the victory of the Free State troops were thus described by Captain S. L. Hinde, who was Baron Dhanis’s second in command:

“... The political geography of the upper Congo basin has been completely changed, as a result of the Belgian campaign against the Arabs. It used to be a commercial region in which the agents of different nations aligned themselves. The local inhabitants, the Arabs, were the masters of the region, and it was the scene of constant conflict. As a result of the campaign of 1894-1895, this is now a peaceful region, free from disturbances. The region has been divided into administrative districts, each under a Belgian officer, and the people are now living in peace and harmony. The trade routes have been completely changed, and the trade which used to follow the well-beaten track from Nyangwe and the Lualaba across Tanganyika to Ujiji, or round the lake to Zanzibar, now goes down the Congo to Stanley Pool and the Atlantic.”

These results had been attained largely by the aid of native levies and allies, and a number of the men who had taken part in the Arab campaign were enlisted as permanent soldiers by the Belgians. Among these were some Batelates, who in 1895 revolted in the Lulua and Lomami districts. The mutineers were eventually defeated; but in 1897, while Baron Dhanis was making his way with a large expedition towards the Nile, the Batelates again revolted, murdered several of their white officers, and took possession of a large area of the eastern portions of the state. Although defeated on several occasions by the Free State forces, the mutineers were not finally dispersed until near the end of 1899, when the last remnant was driven down into German territory and surrendered their arms. In other parts of the country the state had difficulties with native chiefs, several of whom preserved their autonomy. In the central Kasai region the state had been unable to make its authority good up to the time it ceased to exist.

The international position of the Free State was from the first a somewhat anomalous one. It has already been noted that the right of preference accorded to France in 1884, as interpreted in 1887, was not intended to be opposed to that of Belgium. By his will dated the 2nd of August 1889 King Leopold bequeathed to Belgium “all our sovereign rights over the Independent State of the Congo, as they are recognized by the declarations, conventions and treaties concluded since 1884 between the foreign powers on the one side, the International Association of the Congo and

*After 1900 Nyangwe and Kasongo again became towns of some importance, and traffic along the route to Tanganyika revived with the advent of railways, though the main traffic continued down the Congo river.*
the Independent State of the Congo on the other, as well as all the benefits, rights and advantages attached to that sovereignty."

In July 1860 Belgium acquired, by the terms of a loan to the Congo State which was granted free of interest, the option of annexing the state on the expiry of a period of ten years and six months. Notwithstanding this loan the state became involved in further financial difficulties, and on the 9th of January 1865 the Belgian government entered into a treaty with King Leopold II to take over the Free State with all its possessions, claims and obligations, as from the 1st of January of that year. In anticipation of the consent of the Belgian parliament to this treaty, a Franco-Belgian convention was signed on the 5th of February 1865, by which the Belgian government recognized "the right of preference possessed by France over its Congolese possessions in case of their compulsory alienation, wholly or in part." But after long delays and a violent press campaign the ministry fell, the bill providing for annexation was withdrawn, and the chambers voted a further loan to the Free State to enable it to tide over its immediate difficulties. In 1901, on the expiry of the term of years fixed in the loan convention of 1860, the question of the annexation of the Congo State by Belgium again formed the subject of discussion. The bill was brought forward in favour of annexation, but this time it was opposed by the Belgian government, which proposed simply to let the loan run on without interest. King Leopold likewise declared himself to be opposed to immediate annexation, and the bill was withdrawn. Under the terms of the government measure, which finally passed through the Belgian parliament in August 1901, Belgium retained her right of option, though not the right to exercise it at a fixed date. Moreover, in anticipation of the time when the Congo State would become a Belgian colony, there was issued under date of 7th of August 1901 the terms of a proposed loi organique, regulating the government of any colonial possessions which Belgium might acquire.

The discussions which from time to time took place in the Belgian parliament on the affairs of the Congo State were greatly embletted by the charges brought against the state administration. The administration of the state had indeed undergone a complete change since the early years of its existence. A decree of the 1st of July 1885 had, it is true, declared all "vacant lands" the property of the state (Domaine privé de l'État), but it was not for some time that this decree was so interpreted as to confine the lands of the natives to those they lived upon or "effectively" cultivated. Their rights in the forest were not at first disputed, and the trade of the natives and of Europeans was not interfered with. But in 1881—when the wealth in rubber and ivory of vast regions had been demonstrated—a secret decree was issued (Sept. 21) reserving to the state the monopoly of ivory and rubber in the "vacant lands" constituted by the decree of 1885, and circulars were issued making the monopoly effective in the Awumi-Welle, Equator and Ubangi districts. The agents of the state were enjoined to supervise their collection, and in future natives were to be obliged to sell their produce to the state. By other decrees and circulars (October 30 and December 5, 1892, and August 9, 1893) the rights of the natives and of white traders were further restricted. New monopoly laws, issued in 1890 and 1891, constituted the "vacant lands" which became the property of the state, but the effect of the later decrees was to assign to the government an absolute proprietary right over nearly the whole country; a native could not even leave his village without a special permit. The oppressive nature of these measures drew forth a weighty remonstrance from the leading officials, and Monsieur C. Janssen, the governor, resigned. Vigorous protests by the private trading companies were also made against this violation of the freedom of trade secured by the Berlin Act, and eventually an arrangement was made by which certain areas were reserved to the state and certain areas to private traders, but the restrictions imposed on the natives were maintained. Large parts of the state domain were leased to companies invested with very extensive powers, including the exclusive right to exploit the produce of the soil. In other cases, e.g., in the district of Katanga, the state entered into partnership with private companies for the exploitation of the resources of the regions concerned. The "concession" companies were first formed in 1891 under Belgian law; in 1898 some of them were reconstituted under Congo law. In all of them the state had a financial interest either as shareholder or as entitled to part profits.

This system of exploitation of the country was fruitful of evil, and was mainly responsible for the bad treatment of the natives. Only in the lower Congo and a narrow strip of land on either side of the river above Stanley Pool was there any freedom of trade. The situation was aggravated by the creation in 1886, by a secret decree, of the Domaine de la couronne, a vast territory between the Kasai and Ruki rivers, covering about 1,200,000 sq. km. To administer this domain the government of the state lands and treated as the private property of Leopold II, a Fondation was organized and given a civil personality. It was not until 1902 that the existence of the Domaine de la couronne was officially acknowledged. The Fondation controlled the most valuable rubber region in the Congo, and in that region the natives appeared to be treated with the utmost severity. In the closing years of the 19th century and the early years of the 20th the charges brought against the state assumed a more and more definite character. As indicated, they fell under two main heads. In the first place the native policy of the Congo government was denounced as being at variance with the humanitarian spirit which had been regarded by the powers as one of the chief motives inspiring the foundation of the Congo State. In the second place it was contended that the method of exploitation of the state lands and the concessions system nullified the free trade provisions of the Berlin Act. Reports which gave colour to these charges steadily accumulated, and gave rise to the strong agitation against the Congo State government of system. This agitation was particularly vigorous in Great Britain, and the movement entered on a new era when on the 20th of May 1903 the House of Commons agreed without a division to the following motion:

"That the government of the Congo Free State having, at its inception, guaranteed to the powers that its native subjects should be governed with humanity, and that no trading monopoly or privilege should be permitted within its dominions, this House requests the Majesties of Great Britain and of the Netherlands, signatories of the Berlin General Act, by virtue of which the Congo Free State exists, in order that measures may be adopted to abate the evils prevalent in that State."

In accordance with this request the 5th marquess of Lansdowne, then secretary of state for foreign affairs, issued a despatch on the 8th of August 1903 to the British representatives at the courts of the powers which signed the Berlin Act, drawing attention to the alleged cases of ill-treatment of natives and to the existence of trade monopolies in the Congo Free State, and in conclusion stating that His Majesty's government would

---

1 For an account of the loans and liabilities of the state see II. The Belgian Congo, § Finance.
2 The British parliamentary paper Africa No. 1, 1909, contains a memorandum on the land laws in the Congo State, showing the extent to which trade was monopolized throughout its territories by the government.
3 This concession was asserted by traders who had previously dealt direct with the natives, and by traders who hoped so to do, to contravene the provisions of the Act of Berlin prohibiting any commercio monopolium. In the Congo State, however, the concession was maintained, however, that the proprietor who exploits and sells the produce of the land is not engaging in commerce.
4 The best known of these companies are the Abir (Anglo-Belgian Import and Export Co.) and the Société aménageuse du commerce au Congo. In Katanga the companies holding concessions and the state are jointly represented by the Comité spécial du Katanga. In 1906 four new companies were formed in which British, American and French shareholders took part. Among the companies the Union minére du Haut Katanga had for object the development of the mineral wealth of the district named, while the Chemin de fer du Bas Congo undertook to build a railway from Leopoldville to Katanga. The American Congo Company was granted a rubber concession in the Kasai basin. The fourth company, the Société internationale forestière et minière du Congo, combined agricultural and woody enterprises with the exploitation of forest produce.
“be glad to receive any suggestions which the governments of the signatory powers might be disposed to make in reference to this important question, which might perhaps constitute, wholly or in part, the subject of a reference to the tribunal at the Hague.” This despatch failed to evoke any response from the powers, with the single exception of Turkey, but the public agitation against the Congo State régime continued to grow in force, being greatly strengthened by the publication in February 1904 of a report by Mr Roger Casement, then British consul at Boma, on a journey which he had made through the middle Congo region in 1903 (described as the “Upper” Congo in the report). The action on the part of the British government resulted in considerable correspondence with the Congo government, which denied the charges of systematic ill-treatment of the natives and controverted the contention that its policy constituted an infringement of the Berlin Act. In July 1904, however, King Leopold issued a decree appointing a commission of inquiry to visit the Congo State, investigate the condition of the natives, and if necessary recommend reforms. The commission was composed of M. Edmond Janssens, advocate-general of the Belgian Cour de Cassation, who was appointed president; Baron Giacomo Nisco, president ad interim of the court of appeal at Boma; and Dr E. de Schumacher, a Swiss councillor of state and chief of the department of justice in the canton of Lucerne. Its stay in the Congo State lasted from the 5th of October 1904 to the 21st of February 1905, and during that time the commissioners ascended the Congo as far as Stanleyville. The report of the commission of inquiry was published, minus the minutes of the evidence submitted to the commissioners, in November 1905. While expressing admiration for the signs which had come under its notice of the advance of civilization in the Congo State, the commission confirmed the reports of the existence of grave abuses in the upper Congo, and recommended a series of measures which would in its opinion put an end to the same. It approved the concessions system in principle and regarded forced labour as the only possible means of turning to account the natural riches of the country, but recognized that though freedom of trade was formally guaranteed there was virtually no trade, properly so called, among the natives in the greater portion of the Congo State, and particularly emphasized the need for a liberal interpretation of the law, effective application of the law limiting the amount of labour exacted from the natives to forty hours per month, the suppression of the “sentry” system, the withdrawal from the concession companies of the right to employ compulsory measures, the regulation of military expeditions, and the freedom of the courts from administrative tutelage. Simultaneously with the report of the commission of inquiry there was published a decree appointing a commission to study the recommendations contained in the report, and to formulate detailed proposals. Naturally the development of the charges against the Congo State system of administration was followed with close interest in Belgium. Little or nothing was done, however, to advance the bill brought forward in August 1901, providing for the government of the Congo State in the event of its becoming a Belgian colony. The existence of this measure was recalled in a five days' debate which took place in the Belgian parliament in the spring of 1906, when the report of the commission of inquiry and the question of the position of which Belgium stood in relation to the Congo State formed the subject of an animated and important discussion. In the resolution which was adopted on the 2nd of March the chamber, “imbued with the ideas which presided over the foundation of the Congo State and inspired the Act of Berlin,” expressed its confidence in the proposals which the commission of reforms was elaborating, and decided “to proceed without delay to the examination of the projected law of the 7th of August 1901, on the government of Belgium’s colonial possessions.” The report of the reforms commission was not made public, but as the fruit of its deliberations King Leopold signed on the 3rd of June 1906 a number of decrees embodying various changes in the administration of the Congo State. By the advocates of radical reforms these measures were regarded as utterly inadequate, and even in Belgium, among those friendly to the Congo State system of administration, some uneasiness was excited by a letter which was published along with the decrees, wherein King Leopold intimated that certain conditions would attach to the inheritance he had designed for Belgium. Among the obligations which he enumerated as necessarily and justly resting on his legatee was the duty of respecting the arrangements by which he had provided for the establishment of the Domaine de la couronne and the Domaine privé de l’État. It was further declared that the territories bequeathed would be inalienable.

The fears excited by this letter that King Leopold desired to restrict Belgium's liberty of action in the Congo State when the latter should become a Belgian colony were not diminished by the announcement in November 1906 of four new concessions, conferring very extensive rights on railway, mining and rubber companies in which foreign capital was largely interested. This was immediately before the opening in the Belgian chamber of a fresh debate in which the history of the Congo question entered on a new stage of critical importance not only from the national but the international point of view. It had become evident, indeed, that things could not continue as they were. In reply to an influential deputation which waited upon him on the 20th of November, Sir Edward Grey, speaking as the representative of the British government in his capacity as secretary of state for foreign affairs, expressed the desire “that Belgium should feel that her freedom of action is unfettered and unimpaired and her choice unembarrassed by anything which we have done or are likely to do”; but he added that if Belgium should fail to take action “it will be impossible for us to continue to recognize indefinitely the present state of things without a very close examination of our treaty rights and the treaty obligations of the Belgian state.”

The debate in the Belgian chamber opened on the 28th of November and was not concluded till the 14th of December. It was largely occupied with the consideration of the relations between Belgium and the Congo State from the constitutional point of view. A resolution was finally adopted by 128 votes to 1, thirty Socialist members abstaining from voting. In this resolution the chamber took note of “the replies of the government, according to which the declarations contained in the letter of the 3rd of June do not constitute conditions but solemn recommendations,” while “the convention of cession will have no other object than to effect the transference and define the measures for its accomplishment, and the Belgian legislature will regulate the régime of its colonial possessions in unrestricted liberty.” In conclusion the chamber, “desiring without prejudice (sans préjuger sur le fond) that the question of the annexation of the Congo should be brought before the chamber in the shortest possible time, in accordance with the intention expressed by the government,” recorded its desire that the central committee charged to examine the draft law of the 7th of August 1901 should “hasten its labours and lay its report at an early date.”

(J. S. K.)
While the commission was sitting, further evidence was forthcoming that the system complained of on the Congo remained unaltered, and that the “reforms” of June 1906 were illusory. Various revolts of the natives also occurred, and in some parts of the state complete anarchy prevailed. Not only in Great Britain and America did the agitation against the administration of the Congo State gain ground, but in Belgium and France reform associations enlightened public opinion. The government of Great Britain let it be known that its patience was not in-exhaustible, while the senate of the United States declared that it would support President Roosevelt in his efforts for the amelioration of the condition of the inhabitants of the Congo. The attitude of the powers was at the same time perfectly friendly towards Belgium. In this manner the movement in favour of ending the baneful régime of Leopold II. was strengthened.

On the 10th of July 1907 the Belgian premier announced that negotiations with the Congo State would be renewed, and on the 28th of November following a treaty was signed for the cession of the Congo State to Belgium. This treaty stipulated for the maintenance of the Fondation de la couronne. This “government within a government” was secured in all its privileges, its profits as heretofore being appropriated to allowances to members of the royal family and the maintenance and development of “works of public utility” in Belgium and the Congo, those works including schemes for the embellishment of the royal palaces and estates in Belgium and others for making Ostend “a bathing city unique in the world.” The state was to have the right of redemption on terms which, had the rubber and ivory produce alone been redeemed, would have cost Belgium about £8,500,000.

Even those politicians least disposed to criticize the actions of the king protested vigorously against the provisions concerning the Fondation. It was recognized that the chamber would not vote the treaty of cession unless those provisions were modified. Negotiations between Leopold II. and the Belgian premier followed. While they were in progress the British government again expressed its views, and in very monitory language. They were conveyed in a passage in the king’s speech at the opening of parliament on the 29th of January, and in a statement by Sir Edward Grey in the House of Commons on the 26th of February. Sir Edward Grey affirmed that the Congo State had “morally forfeited every right to international recognition,” and quoted with approbation Lord Cromer’s statement that the Congo system was the worst he had ever seen. The foreign secretary declared, in reference to the negotiations for the transfer of the Congo to Belgium, that any semi-transfer which left the controlling power in the hands of “the present authorities” would not be considered by Great Britain as a guarantee of treaty rights. On the same day that Sir Edward Grey spoke a parliamentary paper was issued (Africa No. 1, 1908) containing consular reports on the state of affairs in the Congo. The most significant of these reports was from Mr W. G. Thesiger, consul at Boma, who in a memorandum on the application of the labour tax, after detailing various abuses, added: “The Congo system without change gives rise to these abuses still continues unchanged, and so long as it is unaltered the condition of the natives must remain one of veiled slavery.” Eight days later (on the 5th of March) an additional act was signed in Brussels annulling the clauses in the treaty of cession concerning the Fondation, which was to cease to exist on the day Belgium assumed the sovereignty of the Congo and its property to be absorbed in the state domains. Leopold II., however, was able to obtain generous compensation for the surrender of the Fondation. Certain fragments of the domain, including an estate of 153 sq. m. in Africa, a villa at Ostend, and some land at Laeken, were kept by the king, who further retained a life interest in property on the Riviera and elsewhere. Belgium undertook at her own charges and at an estimated cost of £2,000,000 to complete “the works of embellishment” begun in Belgium with funds derived from the Fondation and to create a debt of £2,000,000 chargeable on the funds of the colony, which sum was to be paid to the king in fifteen annual instalments—the money, however, to be expended on objects “connected with and beneficial to the Congo.” The annuities to members of the royal family were to be continued, and other subsidies were promised. But the most important provision was the agreement of Belgium to respect the concessions granted in the lands of the Fondation in November 1906 to the American Congo Company and the Compagnie forestière et minière, companies in which the Congo State had large holdings.

Both the treaty of cession and the additional act were submitted to the Commission of XVII. That body expressed its approval of both measures. Its report on the treaty and the proposed colonial law were presented to the chamber on the 3rd of April. Neither the treaty, the additional act, nor the colonial law expressly modified the land, commercial and concessionary régime established in the Congo, but article XVII. of the colonial law provided that laws should be passed as soon as possible to settle the natives’ rights to real property and the liberty of the individual, while the Belgian government announced its determination to fulfill scrupulously all the obligations imposed on the Congo by international conventions. Public opinion in Belgium was disturbed and anxious at the prospect of assuming responsibility for a vast, distant, and badly administered country for years to be a severe financial drain upon the resources of the state. But, though those who opposed annexation formed a numerous body, all political parties were agreed that in case of annexation the excises which had stained the record of the Free State should cease.

On the 15th of April 1908 the chamber began a general debate on the Congo question. The debate made it clear that while the Belgian people did not desire colonial possessions, annexation was the only means of escape from a situation the country found intolerable. The debate closed on the 20th of August, when the treaty of annexation, the additional act and the colonial law were all voted by substantial majorities. Amendments had been made in the colonial law giving parliament fuller control over Congo affairs and securing greater independence for the judicature. On the 9th of September following the three measures were also voted by the senate. Thus at length ended the hesitation of the legislature, fourteen years after the first annexation bill had been submitted to it. On the 14th of November the state ceased to exist, the rights of sovereignty being assumed by Belgium the next day without ceremony of any kind.1 Administrative control in Brussels was transferred to the newly created ministry of the colonies.

II. THE BELGIAN CONGO

The colony of which Belgium became possessed in the manner narrated in the historical sketch has an area estimated at 900,000 sq. m. It is bounded by the Atlantic, N. by French Congo, N.E. by the Anglo-Egyptian Sudan, E. by the Uganda Protectorate, British and German East Africa, S.E. by northern Rhodesia (British), S.W. by Angola (Portuguese). The coastline is only 25 m. long. It extends north from the estuary of the Congo, the northern bank of the estuary belonging to Belgium, and the southern bank to Portugal. The greater part of Belgian Congo lies between the parallels of 4° N. and 10° S. and 18° and 30° E.

Physical Features.—Except for its short coast-line, and for a comparatively small area on its eastern frontier, the colony lies wholly within the geographical basin of the Congo. It may roughly be divided into four zones:—(1) the small coast zone west of the Crystal Mountains, through which the Congo breaks in a succession of rapids to the Atlantic; (2) the great central zone, described below; (3) the smaller zone east of the Mitumba range (including the upper courses of some of the Congo tributaries which have forced their way through the mountains), and west of Lake Mweru and the upper course of the Luapula; and (4) an area which belongs geographically to the Nile valley. The Crystal Mountains form the western edge of the great Central African plateau and run, roughly, parallel to the coast. The

1 The first power to recognize the transfer of the state to Belgium was Germany, which did so in January 1909
Mitumba range extends from the south-eastern frontier of the colony, in a north-easterly direction towards Lake Tanganyika, and northwards along the western shore of that lake, past lakes Kivu and Albert Edward to Albert Nyanza, forming the western edge of the western or Albertine rift-valley. This long mountain chain has numerous local names. It varies in altitude from 5000 to 10,000 ft. The eastern escarpment is precipitous, but on its western face it slopes more gently into the Congo basin. North of the Lukuga river the main chain throws out into the central zone, in a north-westerly direction, a secondary range known as the Bambara Mountains, which forms one of the boundaries of the Manyema country. The interior of lake zone is a high plateau with an average elevation of 3000 ft. above sea-level.

The central zone dips with a westerly inclination from the Mitumba Mountains towards the western edge of the plateau. It is described as "a country of alluvial plains, without any marked mountain features, very well watered, covered with forests and wooded savannahs" (A. J. Wauters). The forests occupy the river valleys and are densest in the east and north-east of the state. In these primeval forests the vegetation is excessively rank; passage has to be forced through thick underwood and creeping plants, between giant trees, whose foliage shuts out the sun's rays; and the land teems with animal and insect life of every form and colour. Describing the forests of the Manyema country, west of Lake Tanganyika, David Livingstone wrote: "Into these [primeval forests] the sun, though vertical, cannot penetrate, excepting by sending down at mid-day thin pencils of rays into the gloom. The rain water stands for months in stagnant pools made by the feet of elephants. The climbing plants, from the size of a whipcord to that of a man-of-war's hawser, are so numerous, that the ancient path is the only passage. When one of the giant trees falls across the road, it forms a wall breast high to be climbed over, and the mass of tangled ropes brought down makes cutting a path round it a work of time which travellers never undertake." This description is equally applicable to the forest region extending eastward from the mouth of the Aruwimi almost to Albert Nyanza. This forest covers an area of some 25,000 sq. m., and into a great part of it the sunshine never enters. It is known variously as the
Pygny Forest (from the races inhabiting it), the Aruwimi or Ituri Forest (from the rivers traversing it), the Stanley Forest (from its discoverer), or the Great Congo Forest. It is the largest fragment within the colony of the immense forest which at one time seems to have covered the whole equatorial region. By the banks of the rivers occur the "gallery" formations; i.e., in what appears an impenetrable forest are found avenues of trees "like the colonnades of an Egyptian temple," veiled in leafy shade, and opening into aisles and corridors musical with many a murmuring fount" (Schweinfurth).

The Congo and its tributary streams are separately noticed. They form, both from the point of view of the physical geography and the commercial development of the colony, its most important feature; but next in importance are the forests. The wooded savannas are mostly situated on the higher lands of the central zone, where the land dips down from the Mitumba Mountains to the Congo.

The part of the colony within the Nile basin is geographically of great interest. It includes some of the volcanic peaks which, north of Lake Kivu, stretch across the rift-valley and attain heights exceeding 14,500 ft. The colony includes the whole of the Semliki valley, the so-called "Mountains of the Moon," with snow-clad heights exceeding 16,500 ft. The colony also includes the western shores of lakes Tanganyika and Kivu (g.v.).

Geology.—The portion of the great basin of the Congo included in the colony is mainly occupied, so far as it has been explored, by sandstones. These are separable into a lower group (Kundelungu) of red felspathic grits and into an upper group (Lubilasch) of friable sandstones. Both are considered to represent the Karroo formation of South Africa. The basin in which they were laid down is limited on the east by ancient gneisses and schists overlain by the highly inclined red felspathic grits. The ancient rocks of Katanga form the southern boundary. The northern part of the basin, in the south of the colony proper, consists of a zone of Archean and metamorphic rocks and a region composed of several rock groups considered to range between the Silurian and Carboniferous periods; but it is only in the limESTONES of one of these basaltic hills, in a Devonian age, have been found. Rocks of Cretaceous and Tertiary ages are confined to the maritime zone.

Flora.—The most valuable of the forest flora are the lianas, notably Lanaroloba flava, which yield the India-rubber of commerce. There are also timber trees such as mahogany, ebony, teak, lignum vitae, African cedars and pines, while oil, borassus and bamboo palms are abundant. Other trees are the redwood and mahogany. Green pinnate leaves and tropical climate make the flora in the colony very numerous. Euphorbias attain great size and orchids are characteristic of the forest woods. There are innumerable kinds of moss and lichens and ferns with leaves 12 ft. in length. Of the creepers, a critical variety is the wild tobacco known locally as the "pipe tree" and aloes are common. In the savannas are gigantic baobab trees. In the densest forests the trees, struggling through the tangle of underwood to the light, are often 150 ft. and sometimes 200 ft. in height. Bananas are found in abundance, and a few forests are noted for their coffee 

Climate.—Sunshine in the equatorial zone, Belgian Congo shows, over the greater part of its area, only a slight variation of temperature all the year round. The mean annual temperature is about 90° F. From July to August the heat increases slightly, with a more rapid rise to November. During December the thermometer remains stationary, and in January begins to rise again, reaching its maximum in February. March is also a month of great heat; in April and May the temperature falls, with a more rapid decline in June, the thermometer being usually at its lowest point in September. The mean temperature is lowered on the seaboard by the coast stream from the ocean, and the thermometer falls sometimes to little over 50° F. Again in the plateau regions in the south the night temperature is sometimes as low as 36° F. The distinguishing feature of the wet and dry seasons, where rains fall regularly from October to May, the dry season being from June to September. But nearer the centre of the colony the season is less distinct. The rainfall is reduced by the amount of precipitation, rain falling more or less regularly at all seasons of the year. The seasons of greatest heat and of the heavy rains are thus coincident on the lower river, where fever is much more prevalent than on the higher plateau lands nearer the centre of the continent. The amount of the rainfall shows great variations in different years, according to the available data, the following rule:—That the rainfall increases in the Congo basin (1) in proportion as one nears the equator from the south, (2) as one passes from the coast to the interior. On the lower river are the Katangs, the interior the lands are from the west to north-west, but this prevalence becomes less and less marked towards the interior, until on the upper river they come from the south-east. The wind, however, rarely attains any exceptional velocity. Storms of the greatest violence and frequent attaining great violence. Storms of light rain are much more common, and in rare instances by hailstones, are of not uncommon occurrence. The coast and along the course of the lower river fogs are very rare, but in the interior early morning fogs are far uncommon. Euro-stomata do not occur in the Congo colony, and the country is not suited for European civilization. This is due more to the humidity than to the heat of the climate.

Inhabitants.—The population is variously estimated at from 14,000,000 to 30,000,000. The vast bulk of the inhabitants of the Congo basin belong to the Bantu-Negro stock, but there are found, in the great forests, sparsely distributed bands of the Pygny people, who probably represent the aboriginal inhabitants of Central Africa (see Akua; Bamute; Batwa; Wochua).

In the north-east of the colony, in the upper basin of the Welle and the Mbomu, the Niam-Niam (g.v.) or Azande, a Negroid people, studying the culture of the Euro-stomata, is the Euro-stomata. Inhabitants from the coast, however, have been much reduced by the wars and the violence of the Wars and the violence of the wars. The population is now estimated at about 5,000,000 people, and the greater part of the population are found in the Azande and the Mangbetu tribes. These, who are found chiefly in the country between the Welle and the Aruwimi. The Mangbetu, who formerly established a hegemony over the indigenous population, Mundu, Abisanga, Mambare, &c., have practically disappeared as a tribe, though their language and customs still survive. The characteristics of the inhabitants of this region are well summed up by Casati, who states that the Mege are considered the most skillful in elephant-hunting, the Azande in iron-work, the Mangbetu in wood-carving, the Abarambo in ivory-carving, and the Momfu in agriculture. Arab culture and traces of Arab blood are found in the districts where the slave traders from the east coast had established stations. This Arab influence extends, in varying degrees of intensity, over the whole of the province, which is the region bounded east by east by Tanganyika, west by the Lutala, south by Stanley Falls and the Mangbetu country. It is mainly evident in the adoption of Arab clothing and the building of houses in Arab fashion. In the valley of the Sankuru the population has been slightly modified by Chinese influences. About 1804 a party of coolies from Macao who had been working on the railway in the cataracts region endeavoured to return home overland. They got as far as the Sankuru district, where the survivors settled and married native women.

Of the Bantu tribes several main groups may be distinguished. The lower Congo and coastal regions are occupied by the Ba-Kongo (otherwise Ba-Fiot), a division including the Mushi-Kongo, found chiefly in the Congo division of Angola, and the Basundi,
who live on both banks of the river in the cataract districts, the Kabinda and the Mayumbe—the two last named dwelling in the coastal districts and foot-hills immediately north of the mouth of the Congo. A custom prevails among the coast tribes of placing their marriageable maidens on view in little bowers specially built for the purpose—the skin of the girls being stained red. The Ba-Kongo, as a whole, appear to be a degenerate race, the primitive type having been degraded by several centuries of contact with the worst forms of European civilization (see further ANGOLA: Inhabitantis). Extending from the Kwanza affluent of the Kasai to Lake Tanganyika are the Luba-Lunda groups. Of these the most widespread tribe is the Ba-Luba (q.v.). The next in importance, the Ba-Lunda, are mostly confined to the western half of this vast region. They have given their name to the Lunda district of Angola. From the 16th century (and possibly earlier) down to the close of the 19th century the Lunda peoples formed a more or less homogeneous state, the successive sovereigns being known as the Muata Yanvo. The Katanga, one of the Luba tribes, also founded a kingdom of some extent and power. They occupy and have given their name to the south-east part of the colony. In southern Katanga a tribe called Bassanga are cave-dwellers, as are also the Balomoto, who live in the Kundelungu hills west of Lake Mweru. Proximity connects the Ba-Lunda group are the cannibal Muyaya (q.v.), whose home is the district between Tanganyika and the Lualaba at Nyangwe.

Living north of the Luba-Lunda tribes, and occupying the country enclosed by the great bend of the Congo and bounded west by the Kasai, are a large number of tribes, the chief groups being the Bakuba, Basongo Mino, Balolo, Bakete, Bambala, Bayaka, Bahuana, &c. Of these these Basongo Mino are spread over the country between the Kasai and Lomami. Between the last-named river and the Lualaba dwell the savage and cannibal Batetela and Bakussu. Further north and largely occupying the valley of the Ruki are the Monga, a large forest tribe. Along the middle Congo from Stanley Pool to Stanley Falls the more important tribes are the Bateke, in the Stanley Pool district, but chiefly on the north side of the river in French territory; the Bayanzi (Babangi), between the mouths of the Kasai and the Ubangi; the Bangala, one of the most gifted of the Congo tribes, whence are recruited many of the soldiery; the Bapoto and the Basoko. These Bangala are not to be confused with the Bangala of the Kwanza, also cannibals, who in marauding bands under leaders styled Jaga were devastating the countryside in 1886. The Bangala today, however, are no longer troublesome in the Congo regions. The Banzo and Mogwandi are large tribes living in the region between the Congo and the Ubangi.

These Bantu races may be further divided into plain, forest and riverine tribes. With the exception of a few riverine tribes, such as the Wagenia who are fishers only, all are agriculturists and the majority keen traders, going long distances to buy and sell goods, but there are marked differences among them corresponding to their environment. The riverine tribes build excellent canoes and large "fighting" boats, and are almost uniformly expert boatmen and fishermen and live much on the water; so much so that Hermann von Wissmann and other travellers were struck by the insignificant leg development of several of these tribes. In general the physical development of these people is scarcely so great as that of the average northern European, but the majority are well formed. The most savage and truculent of the tribes are those who live in the forest regions; the most advanced in culture, the dwellers in the plains. Nearly all the tribes have tattoo markings on the face and body; to this rule the Ba-Kongo tribes are an exception. So far as the tribes have come under Arab or European influence, the clothing is extremely scanty, but absolute nudity is not known. The villages of the tribes of the lower Congo are usually surrounded by a palisade; the houses or huts are rectangular and about 7 ft. high, fetish-places are usually found over the entry. The Bateke build their houses in circular groups opening on a sort of courtyard; the houses in Bangala villages are built in parallel rows about 200 ft. apart; plantations of manioc usually surround the villages. Two varieties of culture exist among the tribes inhabiting the state, that extending over the western and central area, and that of the Welle district and eastern fringe. In the former the bow with vegetable string is the chief weapon, and clothing is woven from palm fibre; in the east spear-throwers are found, and in the Welle district swords and throwing-knives also; clothing made from skins also makes its appearance, and more attention is paid to the shields of departed ancestors.

Some tribes, notably the Ba-Luba, possess considerable skill in working in wood, ivory and metals (chiefly iron and copper). The knives, spears and shields of native workmanship frequently show both ingenuity and skill, alike in design and execution. Musical instruments of crude design are common. Over a great part of the country the natives manufacture cloth from vegetable fibre. They employ four different colours, yellow, the natural colour, black, red and brown, which are obtained by dyeing, and these colours they combine into effective designs. In some tribes a rude form of printing designs on cloth is practised, and on the Sankuru and Lukenyu a special kind of cloth, with a heavy pile resembling velvet, is made by Bakuba and other tribes.

In several districts the action of the state officials and the concession companies in enforcing the collection of large quantities of rubber caused the tribes to abandon their former habits, and in consequence the use of betel, and the ancestor worship and cannibalism, formerly so much practised by the Bantu, has largely disappeared. In the higher culture (e.g. the Bangala), has been largely stamped out by the rigorous measures adopted by the state. The holding of slaves, and slave-raiding by one tribe upon another, is also prohibited.

In general, each tribe is autonomous, but, as already stated, considerable kingdoms have been created by the Luba-Lunda groups, as also by the Ba-Kongo, the founders of the "Kingdom of Congo" (see ANGOLA). The Baluba "empire" of Muata Yanvo fell to pieces on the death of the chief Muteba, killed in a war with the Kioko, a Bantu tribe of the upper Kasai, in 1892. At one time this "empire" extended from the Kwanza to the Lualaba. The Katanga kingdom, then ruled by an Unyamwezi adventurer named Miasi, was overthrown by the Congo State in 1891. The kingdom of the Cazembe (q.v.), which was to the south and east of Katanga, has also vanished. Among the Bangala, each village has its chief.

Each tribe speaks a different language or dialect of Bantu, the chief groups being described in the article BANTU LANGUAGES. Swahili, a Bantu tongue with admixture of Arabic, &c., is understood by the people of the larger towns and the coast. The language used in the Congo regions is the most general means of communication. The religion of the Congo tribes is difficult to define. Belief in a Supreme Being is vague but universal, but as this Being is good, or at least neutral, he is disregarded, and the native applies himself to the propitiation and coercion, by magical means, of the countless malignant spirits with which he imagines himself to be surrounded, and which are constantly on the watch to catch him tripping. Elaborate funeral rites, often accompanied by human sacrifice, play a most important part in native life. The idea is that the dead man shall enter the spirit world in a manner befitting his earthly rank, or he would be despoiled by the other spirits, and also that if proper respect were not shown to his remains, he might bring supernatural punishment on his relations. The point to be recognized is the extremely close connexion in the mind of the native between life in this world and the next, and between the mundane and the supernatural.

The European population, before 1880, consisted of a few traders, Dutch, English, French and Portuguese, having factories in the Congo estuary. By the end of 1886 the Europeans numbered 254, of whom 46 were Belgians. In January 1906 the white population had risen to 2943, 1773 being Belgians.

1 Later on a chief named Kalambo carved out a new "empire" in the central part of the Kasai basin, his authority extending westward from the upper Sankuru into the Lunda district of Angola. He was in 1909 and for several years previously independent of the Belgians and Portuguese, and had closed the country to Europeans.
Swedes (200) and Italians (197) came next in numbers. The British numbered 145.

There were formerly many large towns in the European sense, but a number of government stations have been established. At none of these towns is the total population over 5000. Boma (g.x.) is the headquarters of the local administration and the residence of a British Resident. On the left bank of the river, at a distance of about 60 m. from its mouth, is one of the principal ports of call for steamers, and of the centre of a considerable trade. Banana, close to the mouth of the Congo and Banana Point, possesses one of the best natural harbours on the coast, in size, depth, and is capable of sheltering vessels of the largest tonnage. There are a number of European factories, some of them dating from the 16th century, and the place is the centre of a considerable commerce. Matadi is situated on the left bank of the river, at the highest point of land that can be reached by sea-going vessels. It is the point of departure of the Congo railway. The railway company has constructed jetties at which steamers can discharge their cargo. Lukungu, situated on the banks of the river that runs parallel to the tributary of the Congo, is 10° 5' S. of the Lespression. Leopoldville, with its mouth on the right of the river, was formerly the capital of the Falls district, and the chief recruiting station for porters on the lower Congo. Tumba, the present capital of the district, is a station on the Congo railway, the headquarters between Matadi and Stanley Pool. It is situated about 17 m. from Matadi and 143 from Dolo, the terminus of the line on Stanley Pool. Dolo is situated a short distance from the pool, and has two channels by which vessels can enter and leave the port. On the bank of the river, at the crossing of two streams, is the village of Bongi. Stanley Pool is the capital of the Stanley Pool district. It is situated about 7 m. from Dolo on the flanks of Mount Leopold. Other places of importance are Luluaburg, on the Lulu river; Lusambo, the capital of the Lualaba-Kasai district; Bangala and Bangala, on the river of the same name; and Basoko, at the junction of the Aruwimi and the Congo. Jebi is the capital of the Welle district, and in the Lado Enclave, at the mouth of the river, is the headquarters for the Roi. Nyangwe, on the Lualaba, a little south of 4° S., was a large native town, which, about the middle of the 17th century, came under the dominion of the Zanzibar Arabs. It was visited by David Livingstone in 1854. From it the line of the Stanley Pool runs to the upper Lualaba. In 1829 the town was taken from the Africans by the Congo State troops and destroyed. It has since regained considerable importance as a trading centre.

Communications.—There is a regular mail service between Antwerp and the ports of the lower Congo, which are also served by steamers from Liverpool, Hamburg, Rotterdam, and Lisbon. The Congo has also affords over 600 m. of navigable waters (see Congo). The port of Stanley Pool is connected by the railway, opened in 1898, with the capital of Stanley Pool, 10° 5' S. of the equator. From its mouth to Matadi (85 m.) the Congo is navigable by ocean-going vessels. From Matadi a railway, completed in 1898 at a cost of £2,70,000, and 260 m. long, goes past the cataract region and ends at Stanley Pool. From Stanley Pool to the mouth of the Lualaba, a distance of 980 m., the railway runs towards the Nile. An agreement with Great Britain, concluded in May 1906, provided for the continuation of this line from the Congo State border through the Stanley Pool station of lower Congo to the mouth of the Lualaba, the capital of Stanley Pool, a steamboat and railway service across Africa from the Congo mouth to the Red Sea being thus arranged. Another railway (79 m. long), completed in 1906, connects the left bank of the Congo from Stanley Pool, past the rapids to Ponto, whence, there is a navigable waterway of 300 m. to Nyangwe. From Nyangwe a railway goes towards Lake Tanganyika. Above Nyangwe, on the main stream, another railway is built around the next series of cataracts, thus opening to through traffic the whole of the lower Congo. From Stanley Pool the line runs through Stanley Falls, a distance of 2150 m. by water and 506 by rail. The Katanga region is also served by lines forming a continuation of the Northern Rhodesia railway system. The line runs through Stanley Falls, which has its river terminus at the mouth of Stanley Pool, and has a terminus at Mavumbe, the capital. The principal stations are connected by telegraph lines, and, by way of Libreville in French Congo, cable communication with Europe was established in 1905.

Union.

Agriculture.—Until the advent of Europeans the natives, except in the immediate neighbourhood of some of the Arab settlements, did not till the soil. But they native habitations in small villages. They grew bananas, manioc, the sweet potato, the sugar-cane, maize, sorghum, rice, millet, melon and other fruits and vegetables, as well as tobacco, but the constant state of fear in which they were kept prevented either of their neighbours or of the Arabs, or their own small and indiscipline to industry. Nor can it be said that under their white masters the natives have become great agriculturists, though plantations have been established both by the state and private companies, and coffee, cocoa, tobacco, rice and maize are grown for export. Of domestic animals, sheep and goats are common. Oxen have been introduced from Europe. Horses, asses and mules are comparatively rare.

Minerals.—Gold mines are worked at Kilo in the upper basin of the Lualaba, and at Kasai, about 40 m. to the S. of the Kasa. Albert Nyanza, where gold has also been found (in British territory). The Ruwe gold mine is in the Katanga district in the south of the colony. It lies west of the Lualaba on the Mitumba range, in about 11° S., and 20° 20'. On the mouth of the river, the principal gold mine has been reported in the south-eastern region. The wealth of Katanga in copper is great, the richest deposits being in the southern districts, adjacent to the Northern Rhodesia border. In this region, watered by the Kasa, the Eluwim, and the Ruwe, enormous copper ore deposits are found in hills and spurs of rising ground extending over 150 m. east to west. Tin is found on the western edge of the Katanga copper belt and extends north along the banks of the river, as does the mining of gold. Copper is also reported in other areas, such as Mwana and Uvira on Lake Tanganyika. Lead ore, tin (Ubangi basin), sulphur and mercury have been discovered.

Industries and Trade.—The principal industry is the collection of caoutchouc (see RUBBER) from the rubber vines, only exist in western and southern districts. The value of the rubber exported, which in 1886 was only £6,000, had risen to £1,158,000 in 1902. In 1897 the value was £1,728,000. When the state was founded elephant and hippopotamus ivory formed for some years the most important article of commerce, but in the course of time the ivory of the basin the natives were found to have large stores of "dead ivory" in their possession. Palm oil, palm nuts, white copal, coffee, cocoa, rice, earth-nuts and timber are next in importance among the exports. The value of the trade in 1898 was of the Congo was £1,158,000, in the following year (with the railway open) the native produce exported was valued at £1,442,000. In 1905 the total was £2,130,000. More than 75% of the native produce, known as "special exports," go to Belgium. The neighbouring Portuguese possessions and the Belgian Congo have the same agreement with Belgium and Great Britain take most of the remainder of the trade. The principal imports are textiles and clothing, food and drinks, machinery and metals, steamer and arms and ammunition. Two-thirds of the imports are from Belgium, while France, Germany, Great Britain (chiefly cottons), France and Holland. It should be noted that the importation of alcohol, for the use of the natives, is prohibited. Exports greatly exceed the imports in value. Out of a total trade to the value of £8,000,000 in 1905, only £800,000 comprised imports. This is due in large measure to the system of forced labour instituted by the state.

Shipping.—As with the trade the largest share of the shipping is Belgo-Belgian. It is estimated that 85% of the trade goes to Belgium. The majority of the goods exported were by the Belgian government, which is responsible for the customs duties and the collection of the duties. The total value of the goods exported was £1,442,000. In 1905 the total was £2,130,000. The imports are valued at £1,442,000. In 1905 the total was £2,130,000. The imports are valued at £1,442,000.
the Lomami river and the great lakes, and south of the Aruwimi and Welle districts forms the Province Orientale. It is divided into zones, of which the chief are Stanley Falls, Ponthierville, and that administered by the Katanga committee. The districts are also subdivided into zones. In 1898 the territory in the valley of the upper Nile leased from Great Britain was placed for administrative purposes under the same régime as the districts.

Judicial Machinery.—Courts of first instance have been instituted in the various districts, and there is a court of appeal at Boma which revises the decisions of the inferior tribunals. There is a further appeal in all cases where the sum in dispute exceeds a thousand pounds, to a superior council at Brussels, composed of a number of jurists who sit as a cour de cassation.

Religion and Instruction.—The religion of the native population is that commonly called fetishism (see supra, Indishabants). The state makes no provision for their religious teaching, but by the Berlin Act missions of all denominations are secured perfect freedom of action. The state has established agricultural and technical colonies for lads up to the age of fourteen. These colonies make provision for the training of boys recruited from those rescued from slavery, from orphans, and from children abandoned or neglected by their parents. Practical instruction is given in various subjects, but the main object is to provide recruits for the armed force of the state, and only such lads as are unfitted to be soldiers are drafted into other occupations. Missionaries have displayed great activity on the Congo. In 1907 there were about 500 missionaries in the colony, divided in about equal proportion between Protestants and Roman Catholics. They maintain over 100 stations. The missionaries do not confine themselves to religious instruction, but have schools for ordinary and technical training. There are two Roman Catholic bishops.

Finance.—Of the £2,800,000 which was provided by Leopold II, out of his privy purse, and for some time after the recognition of the state this system was continued. In the first ten years of his work on the Congo King Leopold is reported to have spent £1,200,000 from his private fortune. The first five years of the existence of the state were greatly hampered by the provision of the Berlin Act prohibiting the imposition of any duties on goods imported into the Congo region, but at the Brussels conference, 1890, a declaration was signed by the powers signatory to the Berlin Act, authorizing the imposition of import duties not exceeding 10% ad valorem, except in the case of spirits, which were to be subject to a higher duty. By agreement with France and Portugal, a common tariff (6% on most goods imported, 10% on the export of ivory and India-rubber, 5% on other exports) was adopted by these powers and the Congo Free State.

Funds for the administration were also obtained by loans. In July 1887 bonds bearing interest (from January 1900) at 3½% were issued to the amount of £443,000 to represent sums advanced to the founders of the state. The bulk of these bonds (£4,260,000) were issued to King Leopold, but in January 1895 His Majesty cancelled the bonds in his possession. In 1888 and 1889 bearer bonds to the amount of £2,800,000 were issued out of an authorized issue of £6,000,000. The balance of the loan was issued in 1902. The bonds are redeemable in 99 years by annual drawings, and are entitled to an addition of 5% per annum when drawn. The redemption fund is administered by a committee representing the bondholders. The Belgian government in 1890 advanced a sum of £1,000,000, and in 1895 two further sums of £211,000 and 100,000, the former to enable the state to repay a loan and prevent the forfeiture of an immense territory which had been pledged as security to an Antwerp banker, and the latter to balance the 1895 budget. In October 1896 a loan of £600,000 was raised at 4%, and in June 1898 a further sum of £500,000 was raised at the same rate of interest. In October 1900 a 4% loan of £2,000,000 was issued for the purpose of public works, including railways, and in February 1904 a decree was issued authorizing the creation of bonds to bearer for £1,200,000, at 3%. From 1890 to 1900 King Leopold is stated to have made a grant of £400,000 per annum from his private purse to the public funds. In 1901 Belgium renounced the repayment of its loans and the payment of interest, reserving the right to annex the state, whose financial obligations to Belgium would revive only if that kingdom should renounce its rights to annex the Congo. In 1886 the total revenue of the country was under £3,000, derived from the state domains. The revenue from this source, obtained almost entirely from rubber and ivory, had risen in 1891 to £2,800,000, in 1896 to £25,000,000, in 1900 to £448,000, and in 1905 to £660,000. These figures do not, however, disclose the total profits which accrued to the Free State from its trading operations in the Congo. Official returns placed the public expenditure at a higher figure than the revenue. The loans given for 1904 in £1,107,466; expenditure, £1,029,616. The monetary system is based on the gold standard, and the coinage is the same as that of the Latin Union. On the lower Congo transactions are in cash, but on the middle and upper Congo the use of coins in place of barter or the native brass wire currency makes but slow progress. Moreover, save in the lower Congo state payments (down to 1908) were made in trade goods.

Defence.—The army consists of African troops officered by Europeans. Some of the men are recruited from the neighbouring territories, but the greater part consists of locally raised levies, recruited partly by voluntary enlistment and partly by the enforced enlistment of a certain number of men in each district, who are selected by the commissary in conjunction with the local chiefs. The effective strength is about 15,000. There are over 200 European officers, and over 300 European sergeants. The term of service for volunteers does not exceed seven years, while the militiamen raised by enforced enlistment serve for five years on active service, and for two years in the reserve. The artillery includes Krupps, Maxim and Nordenfelds. A fort has been erected at Chinkakassa near Boma, and a recruiting depot is being established at the new port at Kinshassa on Stanley Pool to protect Leopoldville and the railway terminus. The governor-general is commander-in-chief of the armed forces of the state, and the commissioners are in command of the military districts. In the budget, the expenditure on the army was given at £90,000, and by 1900 it had risen to £312,000. In 1905 the charge fell to £221,241.

best general account of the Free State in convenient size. The history section includes a valuable summary of the work of exploration in the Congo basin from the days of David Livingstone up to 1893. "L'Etat indépendant du Congo", by A. J. Wauters (Brussels, 1893), is a good book similar character to that of Chapaux. Both Chapaux and Wauters deal with ethnology and zoology. Sir H. H. Johnston, George Grenfell and the Congo . . . (2 vols., London, 1908), largely geographical, historical, anthropological and philological studies based on the work of Grenfell. See also the "Observations sur la géologie du Congo occidental," Bull. soc. gél. belg. vols. x. and xi. (1896-1897); ibid. "Les Formations post-
primitives du bassin du Congo," Ann. soc. gél. belg. vol. xxix. (1893-
Journ. Geol. Soc. vol. lxii. (1905). The economic aspect of the colony is dealt with in Congo, climat, constitution du sol et hygiène, by Boulger (Brussels, 1896). The Fall of the Congo Arabs, by S. L. Hinde (London, 1897), is an account of the campaigns of 1892-1893 by an English surgeon who served as a captain in the native forces. The Congo State, by D. C. Boulger (London, 1898), and Droit et administration de l'état indépendant du Congo, by F. Cattier (of Brussels University) (Brussels, 1898), and L'afrique
nouvelle, by E. Descamps (professor of droit des gens at Louvain University) (Paris, 1907), are treatises covering all branches of the state's activity, from the standpoint of admirers of the work of Leopold II., in Africa. Professor Cattier in a later work, Étude sur la situation de l'état indépendant du Congo (Brussels, 1906), severely criticizes the Congo administration. The administrative methods are contained in Le Question congolaise, by A. Vermeerch (Brussels, 1906); Il Congo (Rome, 1908), by Captain Baccari; Civilization in Congoland, by H. R. Fox Bourne (London, 1907); and The Congo Mission, by the Rev. W. W. Ruber (London, 1906); and A Memorial on Native Rights in the Land . . . (London, 1909), by E. D. Morel. Ten Years in Equatoria, by Major G. Casati (London, 1891), contains much information connecting with the peoples, zoology, &c., of the north-eastern part of the state. (F. R. C.)

CONGREGATION (Lat. congregatio, a gathering together, from cum, with, greg, gregis, a flock, herd), an assembly of
persons, especially a body of such persons gathered together for religious worship, or the body of persons habitually attending a particular church, hence the basis of that system of religious organization known as Congregationalism (q.v.). Apart from these, the more general meanings of the word, "congregation" is used in the English versions of the Old and New Testaments to translate the Hebrew words אֲדֹתָהּ and קַהּ, the whole community of the Israelites and the assembly of the people. The words "assembly" and "congregation" have been to a certain extent distinguished in the Revised Version, "congregation" being kept for אֲדֹתָהּ and "assembly" for קַהּ. The Septuagint generally translates the first by συνεφασμό, the second by κόινος (see below). In the Greek New Testament it is "Church," "Congregatio," cf. "Assembly," ibid. In the Roman Church "congregation" is applied to the committees of cardinals into whose hands the administration of the various departments of the church is given (see CURIA ROMANA). The committees of bishops who regulate the business at a general council of the church are also known as "congregations." In the Roman Church there are several kinds of associations for religious purposes known by the generic name of "congregation"; such are: (1) those branches of a particular order, which, for the stricter practice of the rules of their order, group themselves together under a special form of government and discipline,—thus the Trappists are a congregation of the Cistercians, the monks of Cluny and St Maur are congregations of the Benedictines; (2) religious societies to which large numbers of people belonging to such communities have either taken no vows, or have not taken "solem" vows; of the many congregations of this class may be mentioned the Oratorians, the Oblates and the Lazarists; (3) in France religious associations of the laity, male or female, joined together for some religious, charitable or educational purpose (see FRANCE: Law and Institutions). Lastly "congregation" in secular usage is applied to two governing bodies at the university of Oxford, viz. the "Ancient House of Congregation," in whom lies the granting and conferring of degrees, consisting of the vice-chancellor, proctors and "regent masters," and secondly the "Congregation of the University of Oxford," created by the University of Oxford Act 1854, and consisting of all members of convocation who are "resident," i.e. have passed 141 nights within a m. of Carfax during that preceding year. All statutes must be passed by this congregation before introduction in convocation, and it alone has the power of amending statutes (see OXFORD). At Cambridge University congregation is the term used of the meeting of the senate. It is
Scottish history, from the fact that the word occurs, in the sense of "church," frequently in the national covenant of 1537, the name of "congregation" was used of the Reformers. Generally and similarly the title of "lords of the congregation" was given to the signatories of the covenant.

CONGREGATIONALISM, the name given to that type of church organization in which the autonomy of the local church, or body of persons went to assemble in Christian fellowship, is fundamental. Varied as are the forms which this idea has assumed under varying conditions of time and place, it remains distinctive enough to constitute one of the three main types of ecclesiastical polity, the others being Episcopacy and Presbyterianism. Episcopacy in the proper sense, i.e. diocesan Episcopacy, represents the principle of official rule in a monarchical form: Presbyterianism stands for the rule of an official aristocracy, exercising collective control through an ascending series of ecclesiastical courts. In contrast to both of these, which in different ways express the principle of clerical or official authority, Congregationalism represents the principle of democracy in religion. It regards church authority as inhering, according to the very genius of the Gospel, in each local body of believers, as a miniature realization of the whole Church, which can itself have only an ideal corporate being on earth. But while in practice it is religious democracy, in theory it claims to be the most immediate form of the teaching of God. Hence regarding as ruling His people directly through Christ as Head of the Church, whether Catholic or local. So viewed, Congregationalism is essentially a "high church" theory, as distinct from a high clerical one. It springs from the religious principle that every body of believers in actual church-fellowship must be free of all external human control, in order the more fully to obey the will of God as conveyed to conscience by His Spirit. Here responsibility and privilege are correlative. This, the negative aspect of the congregational idea, has emerged at certain stages of its history as Independency. Its positive side, with its sense of the wider fellowship of "the Brotherhood" (1 Pet. v. 9, cf. ii. 17), has expressed itself in varying degrees at different times, according as conditions were favourable or the reverse. But catholicity of feeling is inherent in the congregational idea of the church, inasmuch as it is recognized that the local church is an expression of the local unit of habitual Christian fellowship and the church universal. On such a theory confusion between full Catholicity and loyalty to some partial expression of it is minimized, and the feeling for Christians as such, everywhere and under whatever name, is kept pure.

The Congregationalism of the Apostolic Church was, to begin with, part of its heritage from Judaism. In the record of Christ's own teaching the term "church" occurs only twice, once in the universal sense, as the true or Messianic "Israel of God" (Matt. xvi. 18, cf. Gal. vi. 16), and once in the local sense corresponding to the Jewish synagogue (Matt. xviii. 17). As Christianity passed to Gentile soil, the "foreign assembly (eclesia) of privileged citizens in each Greek city furnished an analogy to the latter usage. These, the two senses recognized by Congregationalism, remained the only ones known to primitive Christianity. Writing of the unity of the church as set forth by Paul in Ephesians, Dr Hort (The Christian Ecclesia, p. 168) says: "Not a word in the epistle exhibits the One Ecclesia as made up of many Eccesiae. To each local Ecclesia St Paul has ascribed a corresponding unity of its own; each is a body of Christ and a sanctuary of God: but there is no grouping of them into partial wholes or into one great whole. The members which make up the One Ecclesia are not communities but individual men. The One Ecclesia includes all members of all partial Eccesiae; but its relations to them all are direct, not mediate. It is true that . . . St Paul anxiously promoted friendly intercourse and sympathy
between the scattered Ecclesiae; but the unity of the universal Ecclesia as he contemplated it does not belong to this region: it is a bulk of theology and religion, not a fact of what we call ecclesiastical politics.”

Organization corresponded to the life distinctive of the new Ecclesia. This was one of essential equality among “the saints” or “the brethren,” turning on common possession of and by the one Spirit of Christ. “The whole congregation of the faithful was responsible for the whole life of the church—for its faith, its worship, and its discipline” (Dale). All alike were “priests unto God” in Christ (Apoc. i. 6; 1 Pet. ii. 9) and entrusted with prerogatives of moral jurisdiction (1 Cor. vi. 1 ff.).

“The Ecclesia itself, i.e. apparently the sum of all its male adult members, is the primary body, and it would seem, even the primary authority.” So says Dr Hort (p. 229), adding that “the very origin and fundamental nature of the Ecclesia as a community of disciples renders it impossible that the principle that ought rightly become obsolete.” In the Apostolic age local office was determined, on the one hand, by the divine gifts (charisms) manifesting themselves in certain persons (1 Cor. xii.; Rom. xii. 3 ff.); and on the other by the recognition of such gifts by the inspired common consciousness of each Ecclesia (1 Cor. xvi. 15–18; 1 Thess. v. 12 ff.). In most cases this took formal effect in a setting-apart by prayer, sometimes with laying-on of hands. Such consecration, however, whatever its form, was a function of the local Ecclesia as a whole, acting through those of its members most fitted by gift or standing to be its representatives on the occasion. As to the specific offices thus called into being, whether for supervision or relief (1 Cor. xii. 28), the New Testament knows none in the local church superior to elders, the ruling order in Judaism also. “Bishop” (overseer) was “mainly, if not always, not a title, but a description of the elder’s function” (Hort, p. 232). Each church at first had at its head not a single chief pastor, but a plurality of elders (= bishops) acting as a college.

In course of time there emerged from this presbyterial body a primus inter pares, i.e. a permanent leader, to whom henceforth the description “bishop” tended to be restricted. This is the “monarchical episcopate” which first meets us in the letters of Ignatius, early in the 2nd century (see Church History). But whatever its exact attributes, as he conceived it, it was still strictly a congregational office. Each normal church had its own bishop or pastor, as well as its presbytery and body of deacons. “One city, one church (‘parish in the ancient sense’) with its bishop,” was the rule.1 Hence “if we are to give a name specific to these functions, ‘with which bishops, congregational’ will describe them better than ‘diocesan’.” (Sanday, Expositor, III. viii. p. 333). Nor did this state of things change so soon as is often supposed. It persisted in the main during the 2nd and 3rd centuries, and only faded before the growing influence of metropolitan or diocesan bishops in the 4th century. These, the bishops in the first instance of provincial capitals, gradually acquired a control over their episcopal brethren in lesser cities, analogous to that of the civil governor over other provincial officials. Indeed the development of the whole hierarchy above the congregational bishop was largely influenced by the imperial system, especially after Church and State came into alliance under Constantine.

This sacrifice of local autonomy was in a measure prepared for by an earlier centralizing movement proper to the churches themselves, whereby those in certain areas met in conference or “synod” to formulate a common policy on local problems. Such inter-church meetings cannot be traced back beyond the latter half of the 2nd century, and were purely ad hoc and informal, called to consider specific questions like Montanism and Easter observance. Nor were they at first confined to church officers, much less bishops, but included “the faithful of all sorts (Euseb. Hist. Eccl. v. 16, p. 10), and were in fact “councils composed of whole churches” (ex universis ecclesiis), where there was a true “representation of the whole Christian name” (Tert. De Jejun. 13). In a word, they were “councils of churches” (id. De Pud. 6) and not merely of church officers.

Naturally, however, as areas represented increased, the more indirect and partial became the representation possible. Thus far, however, synods were still compatible with local autonomy and so with Congregationalism. But as the idea that bishops were successors of the apostles came to prevail, presbyters, though sharing in the deliberations, gradually ceased to share in the voting; while synods insensibly acquired more and more coercive control over the churches of the area represented. Yet the momentous change which finally crushed Congregationalism, by substitution of legal coercion for moral suasion as the final means of securing unity, came relatively late in the history of the ancient Catholic Church.

The seat of authority in Discipline, the means by which the church strives to preserve the Christian standard of living from serious dishonour in its own members, is the touch-stone of church politics. The local Ecclesia in the Apostolic age was itself responsible for the conduct of its members (1 Cor. vi. 1 ff., and the Epistles passim). “If a man will not hear the church,” when the local church-meeting utters the mind of Christ on a moral issue, he has rejected the final court of appeal and is ipso facto self-excommunicate (Matt. xviii. 17). This remains the working rule of ante-Nicene Christianity.2 Indeed Cyprian plainly lays it down that the church members must withdraw from sinful officers, since “the people itself in the main has power either of choosing worthy priests (bishops) or of refusing unworthy ones” (Ep. 67, 3).

On the whole, then, Congregationalism, the self-government of each local church, prevailed for the most part during the first two and a half centuries of Christianity, and with it a church life which, with all its developments of ministry and ritual, remained fundamentally popular in basis (cf. T. M. Lindsay, The Church and the Ministry in the Early Centuries, p. 259 and passim). The central idea was the sanctity of the church-members as such, rather than of the ministry as a clerical order. This is implied in the oldest ordination rules and forms of prayer, such as those underlying the “Canons of Hippolytus” and related collections. It is also implied in the congregational form and spirit of the earliest liturgies; but most of all in the discipline of the church before Constantine. But from the time of Cyprian (A.D. 250) the idea of the ministry as clergy or priesthood gained ground, parallel with the more mixed quality of those admitted by baptism to the status of “the faithful,” and with the increasingly sacramental conception of the means of grace.

In both respects the self-action of the Novatianist and Donatist controversies upon Catholicism was disastrous to the earlier idea of church-fellowship. Formal and technical tests of membership, such as the reception of sacraments from a duly authorized clergy, came to replace Christ’s own test of character. The church ceased even to be thought of as a society of “saints,” or to be organized on that basis. The gulf between the “laity” and “clergy” went on widening during the 5th and 6th centuries; and the people, stripped of their old prerogatives (save in form here and there), passed into a spiritual pupilage which was one distinctive note of the medieval Church. In such a Catholic atmosphere Congregationalism could have no being, save among little groups of men who protested against the existing order. These, in proportion as they revived a primitive type of piety, tended to recover also some of its forms of organization. “They bore witness to the loss of the true idea of the Christian church,” though they did not avail to restore it. Still, a good deal of semi-congregationalism probably did exist in obscure circles which precluded the wider Reformation and were merged in it. So was it among the Waldenses, who reasserted the priesthood of all believers: still more among the Lollards,3 who produced

1 An ancient city generally included a district around it, dwellers in which would go ecclesiastically, as well as politically, with those living within the city proper.

2 So not only the Didaché (xv. 3, cf. xiv. 1, 2), but also Tertullian (Apol. ch. 39), and even Cyprian and the 4th-century Apostolic Constitutions (ii. 47), as well as the Didascalia, its 3rd-century basis.

a "conventicle" type of Christian fellowship, supplementary to attendance at the parish church. This, while far short of theocratic Congregationalism, was a prophecy of it.

Congregationalism proper, as a theory of the organized Christian life as contemplated in the New Testament, re-emerges only at the Reformation, with its wide recovery of such aspects of evangelical experience as acceptance with God and constant access to Him through the sole mediation of Christ. The practical corollary of this, "the Priesthood of Believers," though grasped by Luther (cf. Lindsay, *Hist. of the Reformation*, i. 435 ff.) and continental reformers generally, was not fully carried out by them in church organization. This was due partly to a sense that only here and there was a body of believers ripe for the congregational form of church-fellowship, which Luther himself regarded as the New Testament ideal (Dale, pp. 40-43), partly to fear of Anabaptism, the radical wing of the Reformation movement, which first strove to recover primitive Christianity apart altogether from traditional forms. In certain Anabaptist circles the primitive idea of a "covenant" between believers and God as conditioning all their life, especially one with another, was revived (Champlin Burrage, *The Church-Covenant Idea*, Philadelphia, 1904). Their local church life, as moulded by this idea (found even in the church constitution adopted by Hesse in 1526), was congregational in type. But Anabaptism was never able to remain an abiding force on the human mind, and though colonies of its eschatological type that they did not produce the Congregationalism which sprang up there under Elizabeth. This was continuous rather with the Lollard type of secret congregation existing in various places, especially in London and the adjacent counties, at the opening of the 16th century and later (e.g. the "Known Men" at Amersham and elsewhere, Dale, pp. 58 f. 61). Already in 1550 Strype refers to certain "sectaries" in Essex and Kent, as "the first that made separation from the Reformed Church of England, having gathered congregations of their own." Then, during Mary's reign, secret congregations met under the leadership of Protestant clergymen, and, while these were lacking, even of laymen. But these private assemblies of the professors in these hard times," as Strype calls them, were congregational simply by accident. On Elizabeth's accession they ceased to assemble, until it was plain that she did not intend a radical reformation. Then only did some of their members resume secret assembly, with a more definite view to conformity in all things to the New Testament type and that alone.

Still, the development of congregational churches proper was gradual, the result of constant study of the "Word of God" in the light of experience. The process may be traced most clearly in London, where the measures taken in 1565-1566 to enforce clerical subscription to the authorized order of worship, especially touching vestments, certain persons of humbler station began to assemble in houses "for preaching and ministering the sacraments" (Grindal's *Remains*, lxi.). This led in June 1567 to the arrest of some fifteen out of a hundred men and women met in Plumbers' Hall (ostensibly for a wedding), none of whom, to judge from the eight examined, was a minister. Probably they were not long kept in prison, for six of them were among a similar body of 77 persons "found together" in a private house on March 4, 1568, the leaders of whom were imprisoned, and liberated only after "one whole year," early in May 1569 (ibid. pp. 316 ff.). Perhaps it was between 1567 and 1568 that they began to organize themselves more fully in conjunction with four or five of the suspended clergy, with elders and deacons of their own appointing (Grindal, *Zuhrich Letters*, lxxx.; *Remains*, lxi.). This act of ordaining ministers, probably after the Genevan order—which they certainly used from May 1568—and their economic disposal of certain deacons from their church (so Grindal), clearly mark the fact that this body of some 200 persons had now deliberately taken up a position outside the national church, as being themselves a "church" in a truer sense than any parish church, inasmuch as they conformed to the primitive pattern. Their ideal is embodied in a manifesto set forth about 1570 under the title *The True Marks of Christ's Church*, &c., and signed by "Richard Fytz, Minister," as being the "order of the Prievy Church in London, which by the malice of Satan is falsely slandered."

"The minds of them that by the strength and working of the Almighty, our Lord Jesus Christ, have set their hands and hearts to the pure, undiluted and sincere worshipping of God, according to his blessed and glorious Word in all things, only abolishing and abhorring all traditions and inventions of man whatsoever, in the same Religion and Service of our Lord God, knowing this always, that the true and reformed Church of our Lord and Saviour Jesus Christ either hath, or else ever more continually under the cross striveth to have,"

First and foremost, the glorious word and Evangel preached, not only endamege and subject[i.e. by episcopall licence], but freely and purely.

Secondly, to have the Sacraments ministered purely, only and altogether according to the institution and good worde of the Lord Jesus, without any tradition or invention of man.

And last of all, to have not the filthy Canon law, but discipline only and altogether agreeable to the same heavenly and Almighty wordes of our good Lord, Jesus Christ."

Here we have essential Congregationalism, formulated for the first time in England as the original and genuine Christian polity, and as such binding on those loyal to the Head of the Church. All turns, as we see from the petition addressed in 1571 to the queen by twenty-seven persons (the majority women, possibly wives in some cases of men in prison), upon the duty of maintaining within the worldly purity of the church fellowship (2 Cor. vi. 17 f.), and upon moral discipline "by their strength and sure warrant of the Lord's good word, as in Matt. xviii. 15-18 (1 Cor. v.)" were it only in a church of "two or three" gathered in the Name. Whatever may be thought of their application of these principles, there is no mistaking the deeply religious aim of these separatists for conscience' sake, viz. the realizing of the Christian ideal in personal conduct, in a fellowship of souls alike devoted to the Highest; nor can it be doubted that the "mingled" communion of the parish churches made church "fellowship" in the apostolic sense a practical impossibility. This was confessed alike by the bishops (e.g. Whigfield) and by the Puritans, who maintained the paramount duty of remaining within the queen's church and there working for the further reformation which they recognized as sadly needed by English religion. But the radical "Puritans" (the above documents in the State Paper Office are endorsed "Bishop of London: Puritans") felt that this meant treason to the Headship of Christ in His Church; and that until the prince should set aside the superstition and commandments of men, and send forth princes and ministers [like another Josiah], and give them the rule of the Lord, and the example of God to the purity and truth of the apostolic Church," they could do no other than themselves live after that divine ideal. They were not separated of their own choice, but by the word of God acting on their consciences.

"Reformation without tarrying for Anie" was the burden laid on the heart of the Congregational pioneers in 1567-1571; and it continued to press heavily on many, both "Separatists" and conforming "Puritans" (to use the nicknames used by foes), before it became written theory in Robert Browne's work under that title, published at Middelburg in Holland in 1582 (see Browne, Robert). The story of the many attempts made in the interval by forward or advanced Puritans to secure vital religious fellowship within the queen's Church, and of the few cases in which these shaded off into practical Separatism, is still wrapped in some obscurity. But tentative efforts within

parochial limits, by acussing the more godly sort to feel an
inner bond peculiar to themselves, prepared many for the
congregational idea of the church, and on the other hand made
them feel more than ever dissatisfied with the "mixed" services
of the parish church. It seemed to them impossible that vital
religion could be inculcated, unless there were other guarantee
for ministerial fitness than episcopal licensing, unless in fact the
godly in each parish had a voice in deciding whether a man was
called of God to minister the Word of God (see C. Burnage, The
True Story of Robert Browne, pp. 7, 11 f.). But this implied the
gathering of the earnest "professors" in each locality into a
definite body, committed to the Gospel as their law of life.
Such a "gathering church" emerges as the great desideratum with
Robert Browne, between 1572, when he graduated at
Cambridge, and 1580-1581, when he first defined his Separatist
theory. It involved for him a definite "covenant" entered into
by all members of the church, with God and with God's
people, to abide by Christ's laws as ruling all their conduct,
individually and collectively.

It has been debated how far Browne derived this idea from Dutch
Anabaptists, and which and else such Dutch ideas were most caracteristic of
Anabaptists. But they connected it closely with adult baptism, whereas Browne enjoined baptism
for the children of those already in covenant, and in no case taught
re-baptism. Thus he evidently did not will to recognize the
conscious faith the essence of the matter, and regarded the sign or seal as secondary.
Considering then, his other differences from
Anabaptist theories, and the absence of any hint to the contrary
in his own autobiographical references, it is safe to affirm that
he had no consciousness indebtedness to the Anabaptists (Williamson
If he adopted ideas then in the air, whether of Anabaptist or other
origin (see p. 706, footnote 1), he did so as seen in their Scripture.

From Browne's idea of a holy people, covenanted to walk
after Christ's mind and will, all else flowed, as is set forth in his
Book which sheweth the life and manner of all true Christians.
As it may be called the primary classic of congregational theory,
its leading principles must here be summarized. Hearing the
word of God unto obedience being due to "the gift of His Spirit to
His children," every church member is a spiritual person, with a measure of the spirit and office of King, Priest and Prophet,
to be exercised directly under the supreme Headship of Christ.
Thus must we speak of the church as the "body" of Christ, the
members of Christ's body; while their collective inspiration, enabling them to "try the gifts of godliness" of specially endowed
fellow-members, is the "divine warrant in election to church office.
Thus the "authority and office" of "church governors" is not derived from the people, but from God, "by due consent
and agreement of the church." Conference between sister
churches for counsel is provided for; so that, while autonomous,
they do not live as isolated units. Such were the leading features
of Browne's Congregationalism, as a polity distinct from both
Episcopacy and Presbyterianism. Any varieties in the
congregational genus which emerge later on, keep within his general
outlines. To this fact the very nickname "Brownists," usually
given to early "Separatists" by accident, but Congregationalists
in essence, is itself witness.

"The kingdom of God was not to be begun by whole parishes,
but rather of the worthiest, were they never so few." This
sentence from Browne's spiritual autobiography contains the
root of the whole matter, and explains the title of his other
work, also of 1582, A Treatise of Reformation without
tarrying and the wickedness of those Presbyterians which will
not reform till the Magistrate command or compel them. Here
he, first of known English writers, sets forth a doctrine which,
while falling short of the Anabaptist theory that the civil ruler
has no standing in the affairs of the Church, in that religion is
a matter of the individual conscience before God, yet marks a
certain advance upon current views. Magistrates have not
that authority over the church as to be ... spiritual Kings
... but only to rule the commonwealth in all outward
justice. ... And therefore also because the Church is in a
commonwealth, it is of their charge; that is, concerning the
outward provision and outward justice, they are to look to it.

But to compel religion, to plant churches by power, and to force
a submission to ecclesiastical government by laws and penalties,
belonging enforcing them, not to the church but to the
King (Treatise, &c., p. 12). Here Browne distinguishes acceptance of
the covenant relation with God (religion) and the forming or
"planting" of churches on the basis of God's covenant (with
its laws of government), from the enforcing of the covenant voluntarily accepted, whether by church-excommunication or
by civil penalties—the latter only in cases of flagrant impiety,
such as idolatry, blasphemy or Sabbath-breaking. In virtue of
this distinction which implied that the nation was not actually
in covenant with God, he taught a relative toleration. In this
he was in advance even of most Separatists, who held with
Barrow "that the Prince ought to compel all their subjects
to the hearing of God's Word in the public exercises of the
church." As, however, the prince might approve a false type
of Church, in spite of what they both assumed to be the clear
teaching of Scripture, and should so far be resisted, Browne
and Barrow found themselves practically in the same attitude
as leading the prince's religious coercion. It was part of their
higher allegiance to the King of kings.

Between 1580 and 1581, when Browne formed in Norwich the
first church, and then the circle of churches was known on definite scriptural theory, and October 1585, when, being convinced that the times were
not yet ripe for the realization of the perfect polity, and taking
a more charitable view of the established Church, he yielded to
the pressure brought to bear on him by his kinsman Lord
Burlingham, so far as partially to conform to parochial public
worship as defined by law (see Browne, Robert), the history of
Congregationalism is mainly that of Browne and of his writings.
Their effect was considerable, to judge from a royal proclamation
against them and those of his friend Robert Harrison, issued in
June 1583. But the repression of "sectaries" was now, and
onwards until the end of the reign, so severe as to prevent much
action on these lines. Still Sir Walter Raleigh's rhetorical
estimate of "near 20,000" Brownists existing in England in
April 1593, at least means something. We hear of "Brownists" in
London about 1585, while the London petitioners of 1592 refer
to their fellows in "other gaols throughout the land" and
the True Confession of 1596 specifies Norwich, Gloucester, Bury
St Edmunds, as well as "many other places of the land." But
of organized churches we can trace none in England, until we
reach that of Barrow. Robert Browne's "covenant" church
is a cause in which they felt the imperative call of God seems
to have rallied into church-fellowship the Separatists in London,
whether those of Fytz's day or those later convinced by the
failure of the Puritan efforts at reform and by the writings of
Browne. At what exact date this London church—which had a
more or less continuous history down to and beyond 1624—was
actually formed, is open to doubt. It was only in September
1592 that it elected officers, viz. a pastor (Francis Johnson),
a teacher (Greenwood), two deacons and two elders. Yet as
Barrow held that a church could exist prior to its ministry, this
settles nothing.

In 1589 Greenwood and Barrow composed a "True Description
out of the Word of God of the Visible Church," which represents
the ideal entertained in their circle. It was practically identical
with that set forth by Browne in 1582, though they were at
pains to deny personal connexion with him whom they now
referred to as an apostate. The Brownist and the Barrowist
go hand in hand together." So was it said in 1602; and there
is no good ground (see Powicke, pp. 105 ff., 126 f.) for
distinction between the theories of the two leaders as to the authority of

1 See F. J. Powicke, Henry Barrow (1900), pp. 128 f., for his views on
the topic.

2 I.e. to all honest leaders in State, as well as in Church, as it was
in Israel when a king like Hezekiah restored the Covenant and then
was not enforcing obedience to it. The principle of interpretation
of the Divine Will, especially in the case of the "papist" or
traditionalist, lay beyond their vision at the time. Hence their
discipline was not really one of freedom of conscience or toleration.

S. S. Bredwell, The Raising of the Foundations of Brownism (1588),
p. 135. See also F. J. Powicke, "Lists of the Early Separatists",
elders. Both equally teach the supremacy of “the whole church,” in all discipline, including that upon elders and officers generally. Possibly Barrow laid more stress also on the orderly “rules of the Word” to be followed in all church actions, and so conveyed a rather different impression.

After the execution of Greenwood, Barrow and the ex-Puritan Penny (a recent recruit to Separatism), in the spring of 1593, it seemed to some that Separatism was “in effect extinguished.” This was largely true for the time as regards England, thanks to the rigour of Archbishop Whitgift, aided by the new act which left deniers of the king’s power in ecclesiastical matters no option but to leave the realm. Even this hard fate the bulk of the London church was ready to endure. Gradually they resumed church-fellowship in Amsterdam, where they chose the learned Henry Ainsworth, q.s., as teacher, in place of Greenwood, but elected no new pastor, as they expected Francis Johnson (1602-1618) soon to be released and to rejoin them. This he did at the end of 1597, after a vain attempt to find asylum under his country’sflag in Newfoundland. It was here and now that divergent ideals as to the powers of the eldership really emerged. Johnson, a man autocratic by nature, and leaning to his old Presbyterian ideals on the point, held that the latter should possess to the exclusion of the former in their exercise of discipline, much less to depose them; while Ainsworth, true to Barrow and the “old way” as he claimed, sided with those who made the church itself supreme throughout. The church divided on the issue; but neither section has further historical importance. Far otherwise was it with the church which was formed originally at Gainsborough (1602), by “professors” trained under zealous Puritan clergy in the district where Nottinghamshire, Yorkshire and Lincolnshire meet, but which about 1606 reorganized itself for reasons of convenience into two distinct churches, meeting at Gainsborough and in Scrooby Manor House. Ere long these were forced to seek refuge, in 1607 and 1608 respectively, at Amsterdam, whence the Scrooby church moved to Leiden in 1609 (Bradford’s History of Plymouth Plantation, chs. 1-3). The permanent issues of the Gainsborough-Amsterdam church are connected with the origins of the Baptist wing of Congregationalism, through John Smyth and Thomas Helwys. As for the Scrooby-Leiden church under the leadership of Hall, q.s., it was in a sense the direct parent of historical “Congregationalism” alike in England and America (see below, section American).

Separatism was now passing into Congregationalism, both in sentiment and in language. The emphasis changes from protest to calm exposition. In the freer atmosphere of Holland the exiles lose the antithetical attitude, with its narrowing and exaggerative tendency, and gain breadth and balance in the assertion of their distinctive testimony. This comes out in the writings both of Robinson and of Henry Jacob, both of whom passed gradually from Puritanism to Separatism at a time when the silencing of some 300 Puritan clergy by the Canons of 1604, and the exercise of the royal supremacy under Archbishop Bancroft, brought these “brethren of the Second Separation” into closer relations with the earlier Separatists. In a work of 1610, the sequel to his Divine Beginning and Institution of Christ’s true Visible and Ministerial Church, Jacob describes “an entire and independent body-politic,” “endued with power immediately under and from Christ, as every proper church is and ought to be.” But his claim for “independent” churches no longer denies that true Christianity exists “without particular assemblies. Similarly Robinson wrote about 1620 a Treatise of the Lawfulness of hearing of the Ministers of the Church of England which shows a larger catholicity of feeling than his earlier Justification of Separation (1605). These semi-separatists still set great store by the church-covenant, in which they bound themselves “to walk together in all God’s ways and ordinances, according as He had already revealed, or should further make them known to them.” But they realized that “the Lord had more truth and light yet to break forth of his Holy Word,” and this gave them an open-minded and tolerant spirit, which continued to mark the church in Plymouth Colony, as distinct from the Puritans of Massachusetts Bay. Such, then, was the type of church formed in 1616 by Henry Jacob in London. It was founded under the tolerant archbishop George Abbot (1562-1633), and would have been content with toleration such as the French and Dutch churches in England enjoyed. But Charles I. and Archbishop Laud would make no terms with deniers of royal supremacy in religion, and in 1632 this church was persecuted.

Besides such regular churches in London and the provinces under the early Stuarts, there were also numerous “convincetives” composed of very humble folk, such as the eleven about London which Bishop Joseph Hall (1574-1656) reports in 1631, and which he states in 1640 had grown to some eighty. In these latter the latter the semi-separatist spirit probably survived. Further there was a “cfr. The term “independent” to use the term now coming into use. Conjunct repression of civil and religious liberty had made thoughtful men ponder matters of church polity. The majority, indeed, of determined opponents of personal rule in state and church favoured Presbyterianism, particularly before 1641, when Henry Burton’s Protestant Protested brought before educated men generally the principles of Congregationalism, as distinct from Puritanism, by applying them to a matter of practical politics. But besides this telling pamphlet and the controversy which ensued, the experience of New England as to the practicability of Congregationalism, at least in that modified form known as the “New England Way,” produced a growing impression, especially on parliament. Hence even before the Westminster Assembly met in July 1643, Independence could reckon among its friends men of distinction in the state, like Cromwell, Sir Harry Vane, Lord Saye and Sele; while Milton powerfully pleaded the power of Truth to take care of itself. In 1646, 1647, 1648, its champions were fit, if few. They included Thomas Goodwin and Philip Nye, who had practised this polity during exile abroad and now strove to avert the substitution of Presbyterian uniformity for the Episcopacy which, as the ally of absolutism, had alienated its own children (see PRESBYTERIANISM). Yet the “Five Dissenting Brethren” would have failed to secure toleration even for themselves as Congregationalists—such was the dread felt by the assembly for Anabaptists, Antinomians, and other “sectaries”—had it not been for the vager, but widespread Independence existing in parliament and in the army. Here, then, we meet with a distinction (cf. Dale, p. 374 ff.) of moment for the Commonwealth era, between “Independency” as a principle and “Congregationalism” as an ideal of church polity. Independence, like Nonconformity, is primarily a negative term. “It simply affirms the right of any society of private persons to meet together for worship... without being interfered with by any external authority.” Such a right may be asserted on religious grounds, on theories than the congregational or even the Christian. Congregationalism, however, “denotes a positive theory of the organization and powers of Christian churches,” having as corollary independence of external control, whether civil or ecclesiastical. “Historically the two terms have been used interchangeably” during the last two hundred years. But under the Commonwealth many professed the one without fully accepting the other.

During the Civil War Congregationalism broadened out into reciprocal relations with the national life and history. Thenceforth
it involves not only the story of Nonconformity and the growth of religious liberty, but also the whole development of modern England. To sketch even in outline the Evolution of Congregationalism in correspondence with so complex an environmental history is here impossible. Only salient points can be indicated.

During the Protectorate, with its practical establishment of Presbyterians, Independents and Baptists, the position of Congregationalism was really anomalous, in so far as any of its pastors became parish ministers, and so received "public maintenance" and were expected to administer the sacraments to all and sundry. But the Restoration soon changed matters, and by forcing Presbyterians and Congregationalists alike into Nonconformity, placed the former, instead of the latter, in the anomalous position. In practice they became Independents, after trying in some cases to create voluntary presbyteries, like Baxter's Associations, adopted partially in 1653-1660, in spite of repressive legislation. But though Presbyterians did not in many instances become Congregationalists also, until a later date, the two types of Puritanism were drawn closer together in the half-century after 1662. The approach was mutual. Both had given complete effect to John Milton's "Areopagitica." The Congregationalism of the Savoy Declaration (Oct. 12, 1658), agreed on by representatives—the majority non-ministerial—from 120 churches, is one tempered by experience gained in Holland and New England, as well as in the Westminster Assembly. Hence when, after the Toleration Act of 1689, a serious attempt was made to draw the two types together on the basis of Heads of Agreement assented to by the United Ministers in and about London, formerly called Presbyterian and Congregational, the basis partook of both (much after the fashion of the New England Way), though on the whole it favoured Congregationalism (see Dale, pp. 474 ff.). In many trust-deeds of this date (which did not contain doctrinal clauses), and for long after, the phrase "Presbyterian or Independent" occurs. Yet the two gradually drifted apart again owing to doctrinal differences, emerging first on the Calvinistic doctrine of grace, as broke up the joint "Merchants' Lecture" started in 1672 in Pinners' Hall, and next on Christology. In both cases the Congregationalists took the "high," the Presbyterians the "moderate" view. These specific differences revealed different religious tendencies, the one type being more warmly Evangelical, the other more "rational" and congenial in temper with 18th-century Deism. The theological division was accentuated by the Salters' Hall Controversy (1717-1719), which, nominally touching religious liberty versus subscription, really involved differences as to Trinitarian doctrine. Ere long Arianism and Socinianism were general among English Presbyterians (see Unitarianism). Congregationalists, on the other hand, whether Independents or Baptists, remained on the whole Trinitarians, largely perhaps in virtue of their very polity, with its intimate relation between the piety of the people and that of the ministry. Yet the relation of Congregational piety to its religious ideal had already become less intimate and conscious than even half a century before: the system was held simply as one traditionally associated with a serious and unworliday piety. "Church privileges" meant to many only the sacred duty of electing their own ministry and a formal right of veto on the proposals of pastor and deacons. The fusion into one office of the functions of "elders" and "deacons" (still distinguished in the Savoy Declaration of 1658) was partly at least a symptom of the decay of the church-idea in its original fulness, a decay itself connected with the general decline in spiritual intensity which marked 18th-century religion, after the overstrain of the preceding age. Yet long before the Evangelical Revival proper, partial revivals of a warmer piety occurred in certain circles; and among the Independents in particular the new cult of hymnody initiated by Isaac Watts (1707) helped not a little.

The Methodist movement touched all existing types of English religion, but none more than Congregationalism. While the "rational" Presbyterians were repelled by it as "enthusiasm," the Independents had sufficient in common with its spirit to assimilate—after some distrust of its special ways and doctrines—its passion of Christlike pity for "those out of the way," and so to take their share in the wider evangelization of the people and the Christian philanthropy which flowed from the new inspiration. For underneath obvious differences, like the Arminian theology of the Wesleys and the Presbyterian type of their organization, there was latent affinity between a "methodist society" and the original congregational idea of a church; and in practice Methodism, outside the actual control of the Wesleys, in various ways worked out into Congregationalism (see Mackennal, op. cit. pp. 156 ff., Dale, pp. 583 ff.). So was it in the long run with the Countess of Huntington's Conexon, springing from Whitefield's Calvinistic wing of the Revival, not to mention the congregational strain in some minor Methodist churches.

But whilst Congregationalism grew thereby in numbers and in a sense of mission to all sorts and conditions of men—lack of which was one of the disabilities of the New England position before the law (see Mackennal, pp. 142 ff.)—it modified not only its Calvinism but also its old church ideal in the process. During most of the next century it inclined to an individualism untempered by a sense of mystic union with God and in Him with all men (see Dale, pp. 387 ff., for an estimate of these and other changes). It lost, however, its exclusive spirit. Its pulpit, which had always been the centre of power in the churches, has for a century or more taken a wider range of influence in a succession of notable preachers. Congregationalists generally have been to the fore in attempts to apply Christian principles to matters of social, municipal, national and international importance. They have been steady friends of foreign missions in the most catholic form (supporting the London Missionary Society, founded in 1795 on an inter-denominational basis), of temperance, popular education and international peace. Their weakness as a denomination has lain latterly in their very catholicity of sympathy. Thus it was left to the Oxford Revival, with its emphasis on certain aspects of the Church idea, to help to re-awaken in many Congregationalists a due feeling for specific church-fellowship, which was the main passion with their forefathers. Another influence making in the same direction, but in a different spirit, was the Broad Church ideal represented in various forms by Thomas Erskine of Linlathen, F. W. Robertson of Brighton and F. D. Maurice. In the last of these the conception of Christ's Headship of the human race assumed a specially inspiring form. This conception, in a more definitely Biblical and Christian shape, attained forcible expression in the writings of R. W. Dale of Birmingham, the most influential Congregationalist in the closing decades of the 19th century, in whom lived afresh the high Congregationalism of the early Separatists.

Modern Congregationalism, as highly sensitive to the Zeitgeist and to the influence on dogma, shared for a time the critical and negative attitude produced by the first impact of a culture determined by the conception of development as applying to the whole realm of experience. But it has largely outgrown this, and is addressing itself to the progressive re-interpretation of Christianity, in an essentially constructive spirit. Similarly its ecclesiastical statesmen have been developing the full possibilities of its polity, to suit the demands of the time for coordinated effort. While its principle of congregational autonomy has been gaining ground in the more centralized systems,

1 For the distinction between "Gathered" and "Re-formed" churches in this connexion, see Dale, p. 376.

2 Another disability, acutely felt by all Nonconformists, created by the act of 1662, viz. exclusion from the national centres of education, they strove earnestly to remedy by their academies, the story of which is sketched by Dale, pp. 499 ff., 559-561.

3 The modern use of the term "chapel" seems to date only from Methodism (Mackennal, p. 165).
CONGREGATIONALISM

whether Episcopal or Presbyterian, its own latent capacity for co-operation has been evoked by actual needs to a degree never before realized in England. Universities (Dales, 501) became, in some degree in the early days, from Browne to the Savoy Declaration of 1658, but thereafter forced into abeyance, began early in the 19th century to find expression in County Unions on a voluntary basis, especially for promoting home missionary work. These in turn led on to the Congregational Union of England and Wales, formed in 1832, and consisting at first of "County and District Associations, together with any ministers and churches of the Congregational Order recognized by an Association." Later it was found that an assembly so constituted combined the incompatible functions of a council for the transaction of business and a congress for hearing or expressing common opinion; and its constitution was modified so as to secure the latter object only. But after half a century's further experience, public opinion, stimulated by growing need for communal action in relation to certain practical problems of home and foreign work, proved ripe for the realization of the earlier idea in its double form. In 1904 the Union was again modified so as to embrace (1) a council of 300, representative of the county associations, for business for which the Union as such is responsible; and (2) a more representatively constituted council of 400, made up of local churches, together with 299 evangelists and lay pastors; laity and 5603. In other parts of the British empire there are some 1045 churches and mission stations (many native), South Africa, 385; Australia, 317, and Tasmania, 49; British North America, 157; British Guiana, 50, and Jamaica, 48; New Zealand, 35; India, 15; Hongkong, 1. There are also congregational churches in Austria, Bulgaria, Holland, Norway, Portugal, Spain, Sweden, and in Japan (93). Apart from these, however, and some 150,000 communicants in its foreign missions, British and American "Congregationalism" reckons more than a million and a quarter church members; while, including those known as Baptists (q.v.), the total amounts to several millions more.

The Union of 1832 led indirectly to two further developments. In the first place it fostered the growth of Congregationalism in British colonies. Beginnings had already been made—particularly by the London Missionary Society (in British North America, from New England), and later in British Guiana, British Guiana, and British Guiana. The Congregational Missionary Society was founded in connexion with the Union. Secondly, a medium now existed for drawing closer the bonds between English and American Congregationalists. This gradually led to the idea of "An Ecumenical Council of Congregational Churches," broached in 1874, and first realized in 1891, in the London International Council under the presidency of Dr R. W. Dale (q.v.). The second council met in Boston in 1899, and the third in Edinburgh in 1908. Their proceedings were issued in full, and the institution promised to take a permanent place in Congregationalism.

BIBLIOGRAPHY.—The literature bearing on the subject is given with some fulness in the appendix to R. W. Dale's History of English Nonconformity (1890), and its present state is still well illustrated by the able and massive work of H. M. Dexter's Congregationalism of the Last Three Hundred Years, as seen in its Literature (New York, 1889), supplemented by bibliographies in the first vol. of the Congregational Historical Society's Transactions (1901-2). Among the more recent works may be mentioned as additional references, B. A. Davison, Theological Colleges in England (1883); T. W. Davison, Annals of Evangelical Nonconformity in England (1883); R. Halley, Lancashire's Puritanism and Nonconformity (1860); G. H. Pike, Ancient Meeting-Houses in London (1870); J. Brown, History of Congregations in Nottingham and Southwell (1877); W. U. Urwick, Nonconformity in Herefordshire (1884); W. Dunham and

1 In Ireland the oldest existing Congregational church (at Cork) dates from 1760; but most belong to the 19th century. There are now 41 churches, attended by about 10,000 persons. The Channel Islands have 12 churches, the oldest founded in 1803.
CONGREGATIONALISM

In America.—The history of American Congregationalism during its early years is practically that of the origin of New England. It may be said to begin with the arrival in 1620 of a small company including William Brewster, elder of the refugee church in Leiden, which founded Plymouth in the modern Massachusetts in the winter of that year. Strictly speaking the members of this colony were Separatists, i.e. they belonged to the small body of British Independents who “separated” from the state church under the leadership of Richard Clifton or Clyfton (d. 1616), rector of Babworth, and Brewster, a layman of Scrooby in Nottinghamshire. By the end of ten years the Plymouth colony numbered about 300. About 1638 the religious troubles in England led to the emigration of a large number of Puritans: the colony of Massachusetts Bay was founded in 1628-1630 by settlers led by John Endecott and John Winthrop, and a church on congregational lines was founded at Salem in 1629, and another soon afterwards at Boston, which became the centre of the colony. The similarity between the two colonies led to a close relationship, and considerable reinforcements continued to arrive until 1640. Certain differences in opinion on franchise questions led to the founding of the colony of Connecticut in 1634-1636 by settlers led by Thomas Hooker (d. 1647), John Haynes (d. 1654), and others, and the colony of New Haven was founded in 1638 by a small company under John Davenport (1597-1670) and Theophilus Eaton (d. 1658).

In 1643 these four colonial congregations formed a conference with a view to common affairs. It has been calculated that in the period 1620-1640 upwards of 22,000 Puritan emigrants (the figures have been placed as high as 50,000) sailed from British and Dutch ports. The reasons that compelled their departure determined their quality; they were all men of rigorous consciences, who loved their fatherland much, but religion more, driven from home not by mercantile necessities or ambitions, but solely by their determination to be free to worship God. They were, as Milton said, “faithful and freeborn Englishmen and good Christians constrained to forsake their dearest home, their friends, and kindred, whom nothing but the wide ocean and the savage deserts of America could hide and shelter from the fury of the bishops.” Men so moved so to act could hardly be commonplace; and so among them we find characters strong and marked, with equal ability to rule and govern, as William Bradford (1500-1577) and Brewster, Edward Winslow (1585-1655) and Miles Standish (1584-1656), John Winthrop (1588-1649) and Dr Samuel Fuller, and men so inflexible in their love of liberty and faith in man as Roger Williams and young Harry Vane. As were the people so were their ministers. Of these it is enough to name John Cotton, able both as a divine and as a statesman, potent in England by his expositions and apologies of the “New England way,” potent in America for his organizing and administrative power; Thomas Hooker, famed as an exponent and apologist of the “New England way”; John Eliot, famous as the “apostle of the Indians,” first of Protestant missionaries to the heathen; Richard Mather, whose influence and work were carried on by his distinguished son, and his still more distinguished grandson, Cotton Mather. The motives and circumstances of the emigrants determined the nature of the churches they formed as church states. They were all Puritans, but not all Independents—indeed, at first only the men from Leiden were, and they were throughout more enlightened and tolerant than the men of the other settlements. Winthrop’s company were nonconformists but not separatists, esteemed it “an honour to call the Church of England, from whence we rise, our dear mother,” emigrated that they might be divided from her corruptions, not from herself. But the new conditions, backed by the special influence of the Plymouth settlement, were too much for them; they became Independent,—first, perhaps, of necessity, then of conviction and choice. Only so could they guard their ecclesiastical and their civil liberties. These, indeed, were at first formally as well as really identical. In 1631 the general court of the Massachusetts colony resolved, “that no man shall be admitted to the freedom of this body politic, but such as are members of some of the churches within the limits of the same.”

This lasted till 1644. In New Haven the same system prevailed from 1639 till 1665. Church and State, citizenship in the one and membership in the other, thus became identical, and the foundation was laid for those troubles and consequent severities that vexed and shamed the early history of Independency in New England, natural enough when all their circumstances are fairly considered, indefensible when we regard their idea of the relation of the civil power to the conscience and religion, but explicable when their church idea alone is regarded. And this latter was their own standpoint; their acts were more acts of church discipline than those of civil penalty.

The years following the settlement of the four colonies were occupied in the solution of problems in church and civil government and in the preparation for the proper training of ministers. The relation between membership of the church and membership of the civic community has been mentioned. The principal problem which divided the settlers was that known as the “Half Way Covenant,” which concerned the status of the children of original church members. The difficulty was that, according to the principles held by the founders of the churches, the admission to membership of a parent involved a similar status in the case of his children; on the other hand, no adult could be admitted unless the church as a whole was convinced that he was a man of proved Christian character. A compromise was arrived at by two assemblies, the first a convention of ministers held at Boston in 1657, the second a general synod of the churches of Massachusetts in 1662. As a result of these assemblies it was decided that those who had become members in childhood simply by virtue of their parents’ status could not subsequently join in the celebration of the Lord’s Supper nor record votes on ecclesiastical issues, unless they should approve themselves fit; they might, however, in their turn bring their children to baptism and hand on to them the degree of membership which they themselves had received from their own parents. This classification of the members into those who were in full communion and those who belonged only to the “Half Way Covenant” was vigorously attacked by Jonathan Edwards, but it was not abolished until the early years of the 19th century.

Of far greater importance not only to Congregationalism but also to the future of the American colonies with the case taken by the settlers to provide adequate training for their ministers. As early as 1636 they founded Harvard College, and in 1701 Yale College was established. The emphasis laid by the Congregationalists on this branch of their work has been characteristic of their successors both in America and in Great Britain.

Ten years after the foundation of Harvard, missionary work among the Indians was undertaken by John Eliot and Thomas Mayhew. Eliot produced his Indian translation of the Scriptures in 1661-1663, and by about 1675 there were six Indian churches with some 4000 converts.

The enthusiasm which thus marked the early years of American Congregationalists rapidly cooled from one generation to another. It was not until 1734 that a new outburst of zeal was aroused by the “revivalist” work of Jonathan Edwards, followed in 1740-1744 by George Whitefield. But enthusiasm spread slowly to Northampton, Mass., till it swept New England. Unfortunately, however, the solid work achieved was accompanied by much superficial excitement among emotional persons for whom the so-called “Great Awakening” was merely a passing sensation. Moreover there was considerable controversy between the “Old Lights,” who regarded the “revival” as positively pernicious, and the “New Lights,” who approved it. Partly owing to its own faults and partly owing to the stress of political excitement which followed it, the Edwardian revival
was followed by nearly half a century of lethargy, during which the chief interest centred in the gradual growth of doctrinal controversy. Two new theological schools began to emerge from the old Calvinistic theology of the early settlers. The first owed its origin to Jonathan Edwards (the elder) and was carried on by Samuel Hopkins (1721-1802), Joseph Bellamy (1719–1790), Nathaniel Emmons (1745-1840), Jonathan Edwards (the younger) and Timothy Dwight (1752–1817). This system of thought, known as the "New England Theology," rapidly became predominant, and by the beginning of the 19th century was generally adopted. An equally important school, though numerically smaller, came into existence in eastern Massachusetts under the leadership of Charles Chauncy (1792-1872) and Jonathan Mayhew (1720-1766). During the events which led up to the Declaration of Independence this school, known as the "Liberal" school, was not prominent though the number of its adherents steadily grew. Subsequently, however, largely owing to the activity of men like William Ellery Channing, it acquired great importance. As early as 1805 it was recognized as predominant in Harvard College, and in 1815 it had become a distinct denomination under the new title "Unitarian" (see Unitarianism).

When the excitement caused by the Revolution had subsided, Congregationalism entered upon a new period of energy. From 1791 onwards revival work again became prominent with results which far surpassed those of the Edwardian period. The number of church members steadily increased, and activities of wider and more lastingly important were undertaken. The loss of Harvard College compelled the provision of new seminaries, and missionary work both home and foreign was vigorously carried on. The following are the seminaries founded since 1800: Andover (1808), Bangor (1816), Hartford (1834), the theological school of Oberlin College (1835), Chicago (1858), Pacific (1860; now at Berkeley, Cal.); and Atlanta (Georgia), 1901. In 1822 a special theological department was organized at Yale. Up to 1810 missionary work had been carried on at home by several local societies, but in that year the American Board of Commissioners for Foreign Missions was organized. Other societies undertook various departments of work at home, the Congregational Education Society, for assisting candidates for the ministry (1815); the American Missionary Association (1846), founded by the anti-slavery party; for the conversion of the negroes, which subsequently devoted its energies to work among the Indians of the west, the negroes of the south, the Chinese of the west coast and the Eskimo in Alaska; to aid in the building of churches and mission rooms the American Congregational Union was formed in 1853 (now called the Congregational Church Building Society). To these last societies is largely due the growth of the Congregational body in the west. In the early days of this expansion Congregationalism and Presbyterianism worked hand in hand, but the so-called "Plan of Union" (1801) was successively abandoned by the Conservative Presbyterians in 1837 and by the Congregationalists through the "Albany Convention" in 1852. It was this decision which for the first time gave to Congregationalists a true feeling of denominational character (see below).

The 19th century was a period of considerable progress for the Congregational body, and on the whole the same may be said for the first seven years of the 20th century. On the other hand, the numerical increase had not kept pace with the increase of population. The English Congregational Year Book for 1908 said, in reference to the United States: "In spite of phenomenal increase of population Congregationalism in the states, as here in London, is only marking time. If other sister churches were reporting progress, or were simply keeping abreast of the population, these facts would not be so ominous as they undoubtedly are. But we hear no good news of that kind, and gather small comfort from the mere fact that Congregational churches are holding their own as well as any of their neighbours." It must, therefore, be admitted that the great expansion which marked the first half of the 19th century has not been proportionately maintained. None the less, Congregationalism has through its leading representatives taken an increasingly important part in theological controversy and scholarship generally. Among the followers of Jonathan Edwards the more prominent have been N. W. Taylor (Yale) and Edwards A. Park (Andover). A new statement of the doctrine of the Atonement, proposed by Horace Bushnell (1802-1876) about 1850, provoked great controversy, but during the later years of the 19th century was widely accepted under the title of the "New Theology." It has not, however, caused a serious division within the denomination.

Congregationalism in America has thus spread from New England, its primitive home, over the West to the Pacific, but has never had more than a slight foothold in the Southern States. The remarkable junction of the Independents or "Separatists" who emigrated from Leiden to Plymouth, Massachusetts, with the Puritan Nonconformists of Massachusetts Bay, modified Independency by the introduction of positive fraternal relations among the churches. This gave rise to Congregationalism in the more proper sense of the term. Beyond the limits of New England the process of the denomination as such was, as we have seen, a good deal hindered for a long period by the willingness of New Englanders going West either to remain Congregational or to become Presbyterians. They were substantially agreed in doctrine, or to combine with them in a common scheme of policy in which the Presbyterian element was uppermost. It was not until about 1850 that American Congregationalists began to draw more closely together, and to propagate in the Western States and territories their own distinct policy. Meanwhile, without giving up the main principle of the autonomy of the local church, they have developed in various ways an active disposition to co-operate as a united religious body. This tendency to denominational union is manifest partly in the work of the various educational and missionary societies which have been enumerated, but more strikingly in the institution of the National Council, which is convened at intervals of three years, and is composed of ministers and lay delegates representing the churches. The council, like the minor advisory councils which have been from early times called together for the guidance of particular churches on occasions of special difficulty, is each time dissolved at its adjournment. It is possessed of no authority. Its function is to deliberate on subjects of common concern to the entire denomination, and to publish such opinions and counsels as a majority may see fit to send forth to the churches. The first of the National Councils (held at Boston in 1865) issued a brief statement of doctrine (the "Burial Hill Declaration"), descriptive of the religious tenets generally accepted by the denomination. Later (1873) a large committee, previously appointed, framed a more full confession of faith (the "Commission Creed"), with the same end in view. Of course neither of these creeds was in the least binding upon ministers or upon churches, except so far as in each instance they might be voluntarily adopted. The movement in the direction of union has been still further promoted by the International Councils referred to above (section on British Congregationalism ad fin.), in which the American Congregationalists have met the representatives of their brethren in Great Britain and its colonies having the same faith and polity. In the different states, conferences, and other bodies of like character, the representatives of the several churches and their pastors, have sprung up. They have been occupied for the consideration of practical subjects of moment, and for the promotion of a religious spirit. There is a tendency, moreover, to accord to the conferences the function of determining the tests of ministerial standing in the Congregational denomination. In some of the states the licensing of preachers, which was formerly left to the voluntary associations of ministers in the different localities, has been made a function of the state conferences. At the very first, in New England, the theory was held that a minister, on ceasing to be the pastor of a particular church, falls into the rank of laymen. But the view was very soon adopted, and since has universally prevailed, that a minister in such cases still retains his clerical character. In later times the measure of authority conceded to a pastor as the shepherd of a flock has been much diminished in consequence of the gradual
development of democratic feeling in both minister and congregation. This loss of clerical prestige has been due in no small degree to the increasing habit of dispensing with a form of installation, and of substituting for a permanent pastorate, instituted with the advice and consent of a council, an engagement to serve as a minister for a fixed term of one or more years.

Under this custom of "stated supplies" ordination may be granted to those whose ministry in a particular church is made and dissolved by no other process than a mutual agreement. The Congregational churches, as distinct from the churches retaining the same polity, but separated by the adoption of Unitarian opinions, have in times past professed to be Calvinists of stricter or more moderate types. But as early as 1865, Arminians were welcomed to Congregational fellowship. In the last few decades, with the spread in the community of innovations in doctrinal and critical opinions, a wider diversity of belief has come to prevail, so that "Evangelical," in the popular sense of the term, rather than "Calvinistic," is the epithet more suitable to American Congregational preachers and churches.

The Year-Book for 1907 reported the total number of communicants to be 3,929,794 (in 1857, 1,953,572); scholars, 679,044 (in 1857, 195,572); churches, 599 (in 1857, 2350); communicants, 4075 (in 1857, 2315): the amount of benevolent contributions by the churches as $2,591,693, in addition to a total home expenditure of $6,986,727. In the theological seminaries there were 1,197 students in 1879-1880, compared with a maximum of 596 in 1891-1892, and a minimum of 181 in 1894-1895. The American Board of Commissioners for Foreign Missions reported for the year ending August 31, 1907: 579 missionaries and 4135 native workers; 260 churches with 65,000 communicants and 65,000 scholars.

CONGRESS (Lat. congressus, coming together, from congressi, cum, with, and gradus, step), in diplomacy, a solemn assembly of sovereigns or their plenipotentiaries met together for the purpose of definitely settling international questions of common interest. In this political connotation the word first came into use in the 17th century; an isolated instance occurs in 1636, when it was applied to the meeting of delegates summoned by the pope to Cologne, to attempt to put an end to the Thirty Years' War. In 1647 the meetings of delegates for the conclusion of peace, assembled at Osnabrück and Münster, were termed a congress; and in spite of objections to it on the ground that it was "coarse and inappropriate," based on the physiological sense of the word, it continued thenceforward in use.

The adoption of the name Congress for the national legislative body in the United States (and so for other American countries) was simply a development from this usage, for the "Continental Congresses" of 1774 and 1775-1781, and the "Congress of the Confederation" (1781-1788), were, as inter-state representative deliberative bodies, analogous to international congresses, and the Congress of 1780 onwards usually consisted of representatives of the sovereign states composing the Union; this usage, however, dealt with under United States: Political Institutions.

The more general analogous use of the term (Church Congress, &c.) is of modern origin.

In its international sense the term "congress" is only applied to gatherings of first-class importance, attended either by the sovereigns themselves or by their secretaries of state for foreign affairs; less important meetings, e.g. either in preparation for a congress or for the settlement of a particular question, are usually termed "conferences." The dividing line between the congress and the conference is, however, historically ill-defined; and though a congress of the first importance, e.g. that of Vienna (1814-1815), is never otherwise described, the two terms have often been used indifferently in official diplomatic correspondence even of such dignified assemblages as the meetings of sovereigns and statesmen at Aix-la-Chapelle (1818), Troppau (1820) and Laibach (1821). The individual sessions of a congress are also sometimes called conferences.

The results of the work done at various international congresses in developing a sense of the common interests of nations are dealt with under International Law and its allied articles.

The more important congresses, e.g. Münster and Osnabrück (Westphalia) in 1648; Breda, 1667; Aix-la-Chapelle, 1668, 1748, 1815; Niemeggen, 1678; Regensburg, 1685; Ryswick, 1697; Utrecht, 1713; Töscben, 1779; Paris, 1782, 1814, 1815, 1856; Rastadt, 1794; Amiens, 1802; Châtillon, 1814; Vienna, 1814-1815; Troppau, 1820; Laibach, 1821; Verona, 1822; Berlin, 1878, are treated under their topographical headings. The present article is concerned only with the questions of constitution and procedure.

Convocation and constituent Elements of a Congress.—Any sovereign Power has the right to issue invitations to a congress or conference. In principle, moreover, every state directly concerned in the matters to be discussed has the right to be represented. But this principle, though affirmed by the Powers at Aix-la-Chapelle in 1818, has rarely been translated into practice. At the congress of Vienna (1814-1815), the decisions of which affected every state in Europe, a committee of the five great Powers claimed and exercised the right to set everything of importance; and this set the precedent which has been followed ever since. At the congresses of Paris and Berlin, as at that of Vienna, the great Powers regulated the affairs of lesser states without consulting the representatives of the latter. Similarly, at the conference of 1869 on the affairs of Crete no representative of Greece was present; and at the conference of London (1883), on the international regulation of the Danube, the sovereign state of Rumania, though a Danubian Power, was not represented. It was only with great difficulty that Cavour obtained admission to the congress of Paris in 1856, and the proposal of a congress in 1859 broke down on the refusal of Austria to admit the right of Sardinia to be represented. M. Pradier-Fodéré deplores the consistent breach of the "fundamental rule" in this respect; but since every sovereign state, great and small, once admitted, has an equal voice, it is difficult to see how a principle, equitable in theory, could be established in practice. The failure of the Hague conferences to arrive at any substantial results was in fact due, more than anything else, to the admission on equal terms of a crowd of very unequal Powers. It may then be laid down that all congresses and conferences that have effected settlements of importance have been summoned and dominated by Powers strong enough to enforce respect for their views.

Preliminaries.—Before a congress meets it is customary, not only to agree on the place of meeting (a question often of first-class importance) and on the Powers to whom invitations are to be sent, but to define very carefully the nature and scope of the business to be transacted. This is done sometimes by an elaborate exchange of diplomatic correspondence issuing in preliminary conventions, sometimes by the summoning of conferences, e.g. those at Vienna in 1855 preliminary to the congress of Paris in 1856.

Procedure.—When the congress assembles the first business is the verification of powers, which is done by a commission specially appointed to examine the credentials of the plenipotentiaries. It is usual for the Powers, for obvious practical reasons, to be represented by two or three plenipotentiaries. If the foreign minister himself attend, he needs no credentials; those of his colleagues are countersigned by him. The verification being completed, questions of procedure, of precedence and the like, are settled. In earlier times this was a matter of extreme difficulty and delicacy, since there was no norm by which the respective dignity of the representatives of first-class Powers could be established; an incredible amount of time was wasted in futile questions of precedence, and not seldom negotiations for a peace that every one desired broke down on a point of etiquette. All this has been obviated by the rule observed at the congress of Berlin (1878), according to which the plenipotentiaries took their seats at a horse-shoe table in the alphabetical order of the states they represented, according to the French alphabet.

The presidency of the congress is by courtesy reserved for the minister for foreign affairs of the state in which the meeting is held; if, however, he decline to serve, a president is elected;
or, if there be a mediating Power, the minister representing this presides. At the first session the president takes his seat and delivers a speech welcoming the delegates and sketching the objects of the meeting; the bureau of the congress (secretary-assistant secretaries, and archivist) is then elected on the nomination of the president, and its members are introduced to the assembly. Finally the president impresses on all present the obligation of keeping the proceedings secret, and adjourns the session for a day or two, in order that the ministers may have an opportunity of making each others' acquaintance and talking matters over in private. Serious business begins with the second session.

The discussions are governed by carefully defined rules. Thus every proposition must be presented in writing, and all decisions to be binding on all must be unanimous. The secretary keeps the minutes (prockes-verbal) of each session, which are signed by all present and read at the next meeting. This protocol—as it has been called since the congress of Vienna—takes the form of a bald, but very exact resumé of important points discussed, ending with a record of the conclusions and resolutions arrived at. If there be no such results, opinions are recorded. If any plenipotentiary dissent from the general opinion, such dissent must be recorded in the protocol. Sometimes short signed memoranda are also known to have been found in the protocol, stating the reasons that have governed the Powers in question in agreeing to a given conclusion. Individual Powers may express their dissent in two ways: either by placing such dissent on record, as Lord Stewart did at Laibach, or by withdrawing altogether from the sessions of the congress, as Spain did at Vienna and Great Britain at Verona. Though the Final Act of Vienna was issued as the act of all the Powers, the subsequent formal adhesion of Spain was considered necessary to complete the "European" character of that treaty; the action of Great Britain at Verona prevented the intervention in Spain from having the sanction of the concert. At Vienna in 1874, owing to the vast range of the questions to be settled, the work of the congress was distributed among committees; but at Paris (1836) and Berlin (1878) all matters were discussed and settled in full session. The conclusions arrived at after the discussion of the various subjects before the congress are usually embodied in separate conventions, duly signed by the Powers who are a party to them. Finally, these separate conventions are reduced together in an inclusive treaty, signed by all the plenipotentiaries present, known as the Final Act.

CONGREVE, R.—CONGREVE, W.

3rd ed., 1891; Elizabeth of England (1882); Essays, political, social, and religious (1874; 2nd series, 1892); Historical Lectures (collected in one volume, 1902).

CONGREVE, William (1670–1729). English dramatist, the greatest English master of pure comedy, was born at Bardey near Leeds, where he was baptized on the roth of February 1670, although the inscription on his monument gives his date of birth as 1672. He was the son of William Congreve, a soldier, who was soon after his son's birth placed in command of the garrison at Youghal. To Ireland, therefore, is due the credit of his education—as a schoolboy at Kilkenny, as an undergraduate at Dublin, where he was a contemporary and friend of Swift. From college he came to London, and was entered as a student of law at the Middle Temple. The first-fruit of his studies appeared under the boyish pseudonym of "Cleophil," in the form of a novel whose existence is now remembered only through the unabashed avowal of so austere a moralist as Dr. Johnson, that he "would rather praise it than read it." In 1693 Congreve's real career began, and early enough by the latest computation, with the brilliant appearance and instant success of his first play, Old Hang. Then the generous auspices of Dryden, then as ever a living and immortal witness to the falsehood of the vulgar charge which taxes the greater among poets with jealousy or envy, the natural badge and brand of the smallest that would claim a place among their kind. The dis- crown laureate had never, he said, seen such a first play; and indeed the graceless grace of the dialogue was as yet only to be matched by the last and best work of Etherge, standing as till then it had done alone among the barefaced brutalities of Wycherley and Shadwell. The types of Congreve's first work were the common conventional properties of stage tradition; but the fine and clear-cut style in which these types were reproduced was his own. The gift of one place and the reversion of another were the solid fruits of his splendid success. Next year a better play from the same hand met with worse fortune on the stage, and with yet higher honour from the first living poet of his nation. The noble verses, as faultless in the expression as reckless in the extravagance of their applause, prefixed by Dryden to The Double Dealer, must naturally have supported the younger poet; if indeed such support can have been required, against the momentary aspersion of satirical passions, the passing clamour left uninjured and secure the fame of his second comedy; for the following year witnessed the crowning triumph of his art and life, in the appearance of Love for Love (1695). Two years later his ambition rather than his genius adventured on the foreign ground of tragedy, and The Mourning Bride (1697) began such a long career of good fortune as in earlier or later times would have been closed against a far better work. Next year he attempted, without his usual success, a reply to the attack of Jeremy Collier, the nonjuror, "on the immorality and profaneness of the English stage"—an attack for once not discreditable to the assailant, whose honesty and courage were evident enough to approve him incapable alike of the ignominious precaution which might have suppressed his own name, and of the dastardly mendacity which would have stolen the mask of a stranger's. Against this merit must be set the mistake of confounding in one indiscriminate indictment the levities of a writer like Congreve with the brutalities of a writer like Wycherley—an error which ever since has more or less perverted the judgment of succeeding critics. The general case of comedy was then, however, as vulnerable by the argument as unredeemable by the sarcasm of its most brilliant and comparatively blameless champion. Art itself, more than anything else, had been outraged and degraded by the recent school of the Restoration; and the comic work of Congreve, though different rather in kind than in degree from the bestial and blatant licence of his immediate predecessors, was inevitably for a time involved in the sentence passed upon the comic work of men in all ways alike his inferiors. The true and triumphant answer to all possible attacks of honest men or liars, brave men or cowards, was then as ever to be given by the production of work unanswerable alike by fair means or foul, by frank imprecation or furtive
imputation. In 1700 Congreve thus replied to Collier with The Way of the World—the unequalled and unapproached masterpiece of English comedy, which may fairly claim a place beside or but just beneath the mightiest work of Molière. On the stage which had recently acclaimed with uncritical applause the author's more questionable appearance in the field of tragedy, this final and flawless evidence of his incomparable powers met with a rejection then and ever since inexplicable on any ground of conjecture. During the twenty-eight years which remained to him, Congreve produced little beyond a volume of fugitive verses, published ten years after the miscarriage of his masterpiece. His even course of good fortune under Whig and Tory governments alike was counterweighed by the physical infirmities of gout and falling sight. He died, January 19, 1729, in consequence of an injury received on a journey to Bath by the upsetting of his carriage; was buried in Westminster Abbey, after lying in state in the Jerusalem Chamber; and bequeathed the bulk of his fortune to the chief friend of his last years, Henrietta, Duchess of Mandeville, and sufficed, in the end, to provide a rather than to his family, which, according to John, was then in difficulties, or to Mrs Bracegirdle, the actress, with whom he had lived longer on intimate terms than with any other mistress or friend, but who inherited by his will only £200. The one memorable incident of his later life was the visit of Voltaire, whom he astonished and repelled by his rejection of proffered praise and the expression of his wish to be considered merely as any other gentleman of no literary fame. The great master of well-nigh every province in the empire of letters, except the only one in which his host reigned supreme, replied that in that sad case Congreve would not have received his visit.

The fame of the greatest English comic dramatist is founded wholly or mainly on but three of his five plays. His first comedy was little more than a brilliant study after such models as were eclipsed by this earliest effort of his imitator; and tragedy under his hands appears rouged and puffed, in the manner and part of Lady Wishfort. But his three great comedies are more than enough to sustain a reputation as durable as our language. Were it not for these we should have no samples to show of comedy in its purest and highest form. Ben Jonson, who alone attempted to introduce it by way of reform among the mixed work of a time when comedy and tragedy were as inextricably blended on the stage as in actual life, failed to give the requisite ease and the indispensable grace of comic life and movement to the action and passion of his elaborate and magnificent work. Of Congreve's immediate predecessors, whose aim had been to raise on French foundations a new English fabric of simple and unmix'd comedy, Wycherley was of too base metal and Etherege was of metal too light to be weighed against him; and besides theirs no other or finer coin was current than the crude British ore of Shadwell's brutal and burly talent. Borrowing a metaphor from Landor, we may say that a limb of Wycherley's genius might make of the great Congreve, at least, a fox, if the latter had sense enough to make a Sheridan. The broad and robust humour of Vanbrugh's admirable comedies gives him a place on the master's right hand; on the left stands Farquhar, whose bright light genius is to Congreve's as female is to male, or "as moonlight unto sunlight." No English writer, on the whole, has so nearly touched the skirts of Molière; but his splendid intelligence is wanting in the deepest and subtlest quality which has won for Molière from the greatest poet of his country and our age the tribute of exact and final definition conveyed in that perfect phrase which salutes at once and denotes him—"ce moquer pensif comme un apôtre." Only perhaps in a single part has Congreve half consciously touched a note of almost tragic depth and suggestion; there is something well-nigh akin to the grotesque and piteous figure of Arnolphe himself in the unvanquished old age of Lady Wishfort, set off and relieved as it is, with grace and art worthy of the supreme French master, against the only figure on any stage which need not shun comparison even with that of Célimène.

In 1849, contains a biographical and critical notice of Congreve. See also The Comedies of William Congreve (1895), with an introduction by W. G. S. Street; and The Best Plays of William Congreve (1887, 1903), edited for the Mermaid Series by A. C. Ewald. The Life of William Congreve (1887) by Edmund Gosse, in E. S. Robertson's Great Writers, contains a bibliography by J. P. Anderson. (A. C. S.)

CONGREVE, SIR WILLIAM, Bart. (1722–1828), British artilleryist and inventor, was born on the 20th of May 1722, being the eldest son of Lieutenant-General Sir William Congreve (d. 1814), comptroller of the Royal Laboratory at Woolwich, who was made a baronet in 1812. He was educated at Singlewell school, Kent, and (1788–1793) at Trinity College, Cambridge, taking the degrees of B.A. in 1793 and M.A. in 1795. In the latter year he entered the Middle Temple, and on 1808 he lived in Garden Court, at first studying law, later editing a police newspaper, and in the end developing a theory on the development of the war rocket, for which he is chiefly remembered. Through his father he enjoyed many opportunities of experimenting with artillery material, and finally in 1805 he was able to demonstrate to the prince regent, Pitt and others the uses of the new weapon. In 1805 he accompanied Sir Sidney Smith in a naval attack on the French flotilla at Boulogne, but the weather prevented the use of rockets. In another attack on Boulogne in 1806, however, the Congreve rockets, which were fired in salvo from boats of special construction, were very effectual, and in 1807, 1808 and 1809 they were employed with excellent results on land and afloat at the siege of Copenhagen, in Lord Gambier's fight in the Kaske Roads and in the Walcheren expedition. Congreve himself was present in all these affairs. In 1810 or 1811 he became equerry to the prince regent, with whom he was a great favourite, and in 1811 he was elected a fellow of the Royal Society; in the same year he was received into the Royal Artillery, and in 1812 he was made lieutenant-colonel in the Hanoverian artillery. In 1813 he became member of parliament for Gatton. In 1813, at the request of the admiralty, he designed a new gun for the armament of frigates, which was adopted and very favourably reported on. In the same year the newly formed "Rocket Troop" of the Royal Artillery was sent to serve with the Allies in Germany, and this troop rendered excellent service at the battle of Leipzig, where its commander Captain Bogue was killed. In recognition of their services Congreve was shortly afterwards decorated by the sovereigns of Russia and Sweden. Many years later the Congreve rocket was superseded by Hall's, which had no stick.

In 1814, on the death of his father, Colonel Congreve succeeded to the baronetcy and also to the office of comptroller of the Royal Laboratory. He also became inspector of military machines, but his Hanoverian commission did not (it seems) entitle him to command troops of the Royal Artillery, and Congreve was a method of considering time and jealousy between Congreve and the Royal Artillery officers. During the visit of the allied sovereigns to London in this year, Congreve arranged the fêtes and especially the pyrotechnic displays which the prince regent gave in their honour. In 1817 he became senior equerry to the prince and a K.H., and in 1818 major-general d la suite of the Hanoverian army. In 1820 Sir William Congreve was elected M.P. for Plymouth (for which constitution he sat until his death), and in the following year, at the coronation of George IV. (whose senior equerry he remained), he arranged a great pyrotechnic display in Hyde Park. In his later years Congreve took a prominent part in various industrial ventures, such as gas companies, which, however, were for the most part unsuccessful. He died at Toulouse on the 16th of May 1828.

Congreve was an ingenious and versatile man of science. Besides the war rocket he invented a gun-recoil mounting, a time-fuze, a parachute attachment to the rocket, a hydro-pneumatic canal lock and sluice (1839), a perpetual motion machine (see PERPETUAL MOTION), a process of colour printing (1822) which was widely used in Germany, a new form of dynamite, and a method of conserving time (which was applied at the Royal Laboratory); he also took out patents for a clock in which time was measured by a ball rolling on an inclined
CONGRUOUS—

plane; for protecting buildings against fire; inlaying and
combining metals; unforgeable bank-note paper; a method
of killing whales by means of rockets; improvements in the
manufacture of gunpowder; stereotype plates; fireworks;
gas meters, &c. The first friction matches made in England
(1827) were named after him by their inventor, John Walker.
He published a number of works, including three treatises on
The Congreve Rocket System (1807, 1817 and 1821; the last
was translated into German, Weimar, 1829); An Elementary
Treatise on the Mounting of Naval Ordnance (1812); A Description
of the Hydropneumatical Lock (1815); A New Principle of
Steam-Engine (1819); Resumption of Cash Payments (1819);
Systems of Currency (1819), &c.

See Colonel J. R. J. Jocelyn in Journal of the Royal Artillery,
vol. 32, No. 11, and sources therein referred to. The account in
the Dictionary of National Biography is very inaccurate.

CONGRUOUS (from Lat. congrue, to agree), that which
corresponds to or agrees with anything; the derivation appears
in "congruence," a condition of such correspondence or agree-
ment, a term used particularly in mathematics, e.g. for a doubly
infinite system of lines (see SURFACE), and in the theory of
numbers, for the relation of two numbers, which, being
divided by a third number, known as the modulus, leave the same
remainder (see congruence). A certain sense of the word "congruence"
is a feature of Scholastic theology in the doctrine of merit.
God's recompense for good works, if performed in a state of grace,
is based on "congruence," the word "meritum de condigno;" if before such a
state is reached, it should be fit or "congruous" that God should re-
compense such works by conferring the "first grace," the word "meritum
degniu." The term is also used in theology, in reference to the
tensions between the Jesuits and the Dominicans on the
subject of grace, at the end of the 16th century (see Molina,
Luis, and Suarez, Francisco).

CONIBOS, or MANOAS, a tribe of South American Indians
inhabiting the Pampa del Sacramento and the banks of the
Ucayali, Peru. Spanish missionaries first visited them in 1583,
and in 1685 some Franciscans who had founded a mission among
them were massacred. A like fate befell a priest in 1695. They
have since been converted and are now a peaceful people.

CONIC SECTION, or briefly CONIC, a curve in which a plane
intersects a cone. In ancient geometry the name was restricted
to the three particular forms now designated the ellipse, parabola
and hyperbola, and this sense is still retained in general works.
But in modern geometry, especially in the analytical and pro-
ductive methods, the "conic sections," the "conic section of confocal
or confocal conics" is used, to include the inclusion of the other forms of
the section of a cone, viz. the circle, and two lines (and also two points, the reciprocal of two
lines) under the general term CONIC. The definition of conics as
sections of a cone was employed by the Greek geometers as
the fundamental principle of their researches in this subject; but
the subsequent development of geometrical methods has brought
into many other means for defining these curves. One definition,
which is of especial value in the geometrical treatment of the
conic sections (ellipse, parabola and hyperbola) in plano, is that a
conic is the locus of a point whose distances from a fixed point
(termed the focus) and a fixed line (the directrix) are in constant
ratio. This ratio, known as the "eccentricity," determines the nature of the curve; if it be greater than unity, the conic is a
hyperbola; if equal to unity, a parabola; and if less than unity, an ellipse. In the case of the circle, the centre is the focus,
and the line at infinity is the directrix; we therefore see that the
circle is a conic of zero eccentricity.

In projective geometry it is convenient to define a conic section
as the projection of a circle. The particular conic in which the
circle is projected depends upon the relation of the
"vanishing line" to the circle; if it intersects it in real points,
then the projection is a hyperbola, if in imaginary points an
ellipse, and if it touches the circle, the projection is a parabola.
These results may be put in another way, viz. the line at infinity
intersects the hyperbola in real points, the ellipse in imaginary
points, and the parabola in coincident real points. A conic may
also be regarded as the polar reciprocal of a circle for a point;

if the point be without the circle the conic is an ellipse, if on the
circle a parabola, and if within the circle a hyperbola. In
analytical geometry the conic is represented by an algebraic
equation of the second degree, and the species of conic is solely
determined by means of certain relations between the coefficients.
Confocal conics are conics having the same foci. If one of the
foci be at infinity, the conics are confocal parabolas, which may
also be regarded as parabolas having a common focus and axis.
An important property of confocal systems is that only two
confocal can be drawn through a specified point, one being an
eellipse, the other a hyperbola, and they intersect orthogonally.
The definitions given above reflect the intimate association
of these curves but, it frequently happens that a particular conic
is defined by some special property (as the ellipse, which is the
locus of a point such that the sum of its distances from two
fixed points is constant); such definitions and other special
properties are treated in the articles ELLIPSE, HYPERBOLA and
PARABOLA. In this article we shall consider the historical
development of the geometry of conics, and refer the reader to
the article GEOMETRY: Analytical and Projective, for the special
methods of investigation.

History.—The invention of the conic sections is to be assigned
to the school of geometers founded by Plato at Athens about the
5th century B.C., and to the second great and inspirational
philosopher much attention was given to the study of solids,
and it is probable that while investigating the cone, Menelaus,
an associate of Plato, pupil of Eudoxus, and brother of Dino-
stratus (the inventor of the quadratrix), discovered and investigat-
ed the various curves made by truncating a cone. Menelaus
discussed three species of cones (distinguished by the magnitude
of the vertical angle as obtuse-angled, right-angled and acute-
angled), and the only section he treated was that made by a
plane perpendicular to a generator of the cone; according to
the species of the cone, he obtained the curves now known as the
hyperbola, parabola and ellipse. He made considerable
progress in the study of these curves is evidenced by Eutocius,
who flourished about the 6th century a.d., and who assigns to
Menelaus two solutions of the problem of duplicating the
cube by means of intersecting conics. On the authority of the
two great commentators Pappus and Proclus, Euclid wrote
four books on conics, but the originals are now lost, and all we
have is chiefly to be found in the works of Apollonius of Perge.
Archimedes contributed to the knowledge of these curves by
determining the area of the parabola, giving both a geometrical
and the symbolic solution of the problem of finding the ratio of
two areas and showing how to convert the area of an elliptic
to circular spaces. He probably wrote a book on conics, but
itin is now lost. In his extant Conoids and Spheres he defines a
conoid to be the solid formed by the revolution of the parabola
and hyperbola about its axis, and a spheroid to be formed
similarly from the ellipse; these solids he discussed with great
acumen, and effected their cubature by his famous "method
of exhaustions."

But the greatest Greek writer on the conic sections was
Apollonius of Perge, and it is to his Conic Sections that we are
indebted for a review of the early history of this subject.
Of the eight books which made up his original treatise, only seven
are certainly known, the first four in the original Greek, the next
three are found in Arabic translations, and the eighth was
restored by Edmund Halley in 1710 from certain introductory
lemmas of Pappus. The first four books, of which the first three
are dedicated to Eudemos, a pupil of Aristotle and author of the
original Eudemian Summary, contain little that is original,
and are principally based on the earlier works of Menelaus,
Archimedes (probably a senior contemporary of Euclid, flourishing
about 250 B.C.). The remaining books are strikingly original and are to be regarded as
embracing Apollonius's own researches.

The first book, which is almost entirely concerned with the
construction of the three conic sections, contains one of the most
brilliant of all the discoveries of Apollonius. Prior to his time, a
good cone of a definite vertical angle was required for the generation
of any particular conic; Apollonius showed that the sections
could all be produced from one and the same cone, which may be
Either right or oblique, by simply varying the inclination of the cutting plane. The importance of this generalization cannot be overestimated; it is of more than historical interest, for it remains the basis upon which certain authorities introduce the study of the conic sections. Let the straight line AP of Apollonius, imagine an oblique cone on a circular base, of which the line joining the vertex to the centre of the base is the axis. The section made by a plane containing the axis and perpendicular to the base is a triangle, but if the plane meets the cone under any angle other than $90^\circ$, the section is a curve. If the plane cuts the curve in two different points, the section is a hyperbola; if it is tangent at one point, a parabola; and if it is tangent at two points, a hypothetical conic, which is a curve with one point of contact. A conic section may be described as the curve on a cone formed by the intersection of the plane with the cone. The name ellipse is given to the curve resulting from a cutting plane that is perpendicular to the cone's vertical axis. The name hyperbola is given to the curve resulting from a cutting plane that is inclined to the vertical axis. The name parabola is given to the curve resulting from a cutting plane that is parallel to the side of the cone. A conic section is a curve that is a section of a cone created by a plane intersecting the cone. Conic sections include the circle, ellipse, parabola, and hyperbola. A circle is a conic section formed by a plane perpendicular to the cone's axis. The line joining the center to any point on the circle is called the radius. The center of a circle is the point from which all points on the circle are equidistant. A circle is a symmetrical figure, and all diameters, which are line segments passing through the center and intersecting the circle at both ends, are equal in length. A circle is a closed curve that is equidistant from a fixed point called the center. A conic section is a curve that is a section of a cone created by a plane intersecting the cone. CONINE—CONISTERIUM

Similar methods were devised by Sir Isaac Newton and Colin Maclaurin. In Newton's method, two angles of constant magnitude are caused to revolve in such a manner that the intersection of two limbs moves along a fixed straight line; then the two remaining limbs envelop a conic. Maclaurin's method, published in his *Geometria organic* (1710), is based on the proposition that the locus of the vertex of a triangle, the sides of which pass through three fixed points, and the base angles move along two fixed lines, is a conic section. Both Newton's and Maclaurin's methods have been developed by Michel Chasles. In modern times the study of the conic sections has proceeded along the lines which we have indicated; for further details reference should be made to the article GEOMETRY.

Authorities.—For the ancient geometry of conic sections, especially of Apollonius, reference should be made to T. L. Heath's *Apollonius of Perga* (1886); more general accounts are given in James Gow, *A Short History of Greek Mathematics* (1884), and in H. G. Zeuthen, *Die Lehre von dem Keikchenston in Alterthum* (1886). Michael Chasles in his *Apercu historique sur l'origine de l'analyse* (1893) gives an account of the development of the methods in geometry (1837, a third edition was published in 1889), gives a valuable account of both the ancient and modern geometry of conics; a German translation with the title *Geschichte der Geometrie* was published in 1839 by L. O. Scheckel, with a brief account of the later investigations of K. F. Gauss. The history of the conic sections in the *Bibl. math.* (Leipzig, 1799). The history is also treated in general historical treatises (see MATHEMATICS).

Geometrical constructions are treated in T. H. Eagles, *Constructive Geometry* (1895), and in H. S. Carlin, *Conic Sections* (1896); geometric investigations primarily based on the relation of the conic sections to a cone are given in Hugo Hamilton's *De Sectionibus Conica* (1778); this method of treatment has been largely replaced by considering the curves from their definition in plane, and then passing to their derivation from the cone and cylinder. This method is followed in most modern works. Of such text-books there is an ever-increasing number; here we may notice W. H. Besant, *Geometrical Conic Sections*; C. Smith, *Geometrical Conics*; W. H. Drew, *Geometrical Treatises on Conic Sections*. Reference may also be made to C. Taylor, *An Introduction to Ancient and Modern Geometry of Conics* (1886).

See also list of works under GEOMETRY: Analytical and Projective.

CONINE, or CONINE (α-propyl-piperidine), C₈H₁₇N, an alkaloid occurring, associated with γ-conine, conhydrine, pseudo-conhydrine, and methyl conine, in henbane (Hyoscyamus niger, moor-latenum). It is a colourless oil, liquid of specific gravity 0.845 (20° C.), boiling at 166° C., almost insoluble in water, soluble in ether and in alcohol. It has a sharp burning taste and a penetrating smell, and acts as a violent poison. It is dextro-rotatory.

The alkaloid is a strong base and is very readily oxidized; chromic acid converts it into normal butyric acid and ammonia; hydrogen peroxide gives aminopropylvalerolaldehyde, NH₂CH(CH₃)_2CHO, whilst the benzoyl derivative is oxidized by potassium permanganate to benzoyl-a-aminovaleric acid, C₆H₅CONHCH(CH₃)_2CHO. It combines directly with methyl iodide to form dimethyl coniinum iodide, C₆H₅CN₂I, which by the destructive methylation process of A. W. Hofmann (Berichte, 1881, 14, pp. 494, 695) is converted into the hydrocarbon conylene C₆H₅H₄, a compound that can also be obtained by heating nitrosoconine with phosphoric anhydride to 89-90° C. On heating conine with concentrated hydrochloric acid and phosphorus it is decomposed into ammonia and normal octane C₈H₈. Conine has a common property with chloroarotic acid to form a derivative with chlorocarbost er and a tertiary base (methyl conine) with methyl iodide; reactions which point to the presence of the =NH group in the molecule.

It was the first alkaloid to be synthesized, a result due to A. Ladenburg (see various papers in the *Berichte* for the years 1881, 1884, 1885, 1886, 1889, 1893, 1894, 1895, and Liebig's *Annalen* for 1888, 1894). A. W. Hofmann had shown that conine on distillation with zinc dust gave α-propyl pyridine (conyline). This substance when heated with hydriodic acid to 300° C. is converted into α-propyl piperidine, which can also be obtained by the reduction of α-allyl pyridine (formed from α-methyl pyridine and paraformaldehyde). The α-propyl piperidine so obtained is the inactive (racemic) form of conine, and it can be resolved into the dextro- and laeo- varieties by means of dextro-tartaric acid, the d-conine d-tartarate with caustic soda, giving d-conine closely resembling the naturally occurring alkaloid. A. Ladenburg (Ber., 1896, 39, p. 2486) showed that the difference in the rotations of the natural and synthetic d-conine is not due to another substance, iso-conine, as was originally supposed, but that the artificial product is a stereo-isomer, which yields natural conine on heating for some time at 200-300° C., and then distilled.

γ-Conine, C₆H₅NO, and pseudoconine are probably dehydroisomers, the latter being converted into the former when boiled with ligroin. Since conine is dehydrated by phosphorus pentoxide into a mixture of α and β conine, it may be considered an oxyconine. Methyl conine, C₆H₅NO or C₆H₄N(CH₃), is synthesized from conine and an aqueous solution of potassium methyl sulphate at 100°.

CONINGTON, JOHN (1825-1890), English classical scholar, was born on the roth of August 1825 at Boston in Lincolnshire. He knew his letters when fourteen months old, and could read well at three and a half. He was educated at Beverley Grammar school, at Rugby and at Oxford, where, after matriculating at University College, he entered into residence at Magdalen, where he was to remain, except for a term, till 1855. He was an Ireland and Hertford scholar in 1844; in March 1846 he was elected to a scholarship at University College, and in December of the same year he obtained a first class in classics; in February 1848 he became a fellow of University. He also obtained the Chancellor's prize for Latin verse (1847), English essay (1848) and Latin essay (1849). He successfully applied for the Eldon law scholarship in 1849, and proceeded to London to keep his terms at Lincoln's Inn. The legal profession, however, proved distasteful, and after six months he resigned the scholarship and returned to Oxford. During his brief residence in London he formed a connexion with the Morning Chronicle, which was maintained for some time. He showed no special aptitude for journalism, but a series of articles on university reform (1849-1850) is noteworthy as the first public expression of his views on a subject that always interested him. In 1854 his appointment, as first occupant, to the chair of Latin literature, founded by Corpus Christi College, gave him a congenial position. From this time onwards, and during the last ten years of his life, he was almost exclusively to Latin literature. The only important exception was the translation of the last twelve books of the Iliad in the Spenserian stanza in completion of the work of P. S. Worsley, and this was undertaken in fulfilment of a promise made to his dying friend. In 1852 he began, in conjunction with Prof. Goldwin Smith, a complete edition of Virgil with a commentary, of which the first volume appeared in 1858, the second in 1864, and the third soon after his death. Prof. Goldwin Smith was compelled to withdraw from the work at an early stage, and in the last volume his place was taken by H. Nettleship. In 1866 Conington published his most famous work, the translation of the Aeneid of Virgil into the octosyllabic metre of Scott. The version of Dryden is the work of a stronger artist; but for fidelity of rendering, for happy use of the principle of compensation so as to preserve the general effect of the original, and for beauty as an independent poem, Conington's version is superior. That the measure chosen does not reproduce the majestic sweep of the Virgilian verse is a fault in the conception and not in the execution of the task. Conington died at Boston on the 23rd of October 1869.

His edition of Persius with a commentary and a spirited prose translation was published posthumously in 1872. In the same year appeared his Miscellaneous Writings, edited by J. A. Symonds, with a memoir by Professor H. J. S. Smith (see also *N. Y. Philosophical Magazine* for 1870). Other editions are Aeschylus, Agamemnon (1848), Choephoroi (1857); English verse translations of Horace, Odes and Carmen Saeculare (1863), Satires, Epistles and Ars Poetica (1866).

CONISTERIUM (from Gr. κονιστήρ, dust), the name of the room in the ancient palaestra or thermæ (baths) where wrestlers, after being anointed with oil, were sprinkled with sand, so as to give them a grip when wrestling.
CONJEEVERAM, KANCHIPURAM, a town of British India, in the Chingleput district of Madras, 45 m. W.S.W. of Madras by rail. Pop. (1901) 46,164. It is esteemed by all Hindus as one of the holiest places in Southern India, ranking among the seven sacred cities of India, and is remarkable for the number of its temples and shrines. Of these the old Jain temple, situated in a hamlet some 2 m. south of the Weavers’ quarter of the city (Pillapalisaiyam), dates from the time when the Chola power was at its height (12th or 13th century), and is of great importance to the historian by reason of the inscriptions, which contain an almost perfect record of the dynasties who held the country. Older than this temple are the Vaikuntha Perumal temple of Vishnu and the Siva temple of Kailansanath, which date from the time of the Pallava kings. The great temple of Siva, dedicated to Ekambara Swami (the god with the single garment) is remarkable for its lofty towers (gopuram) and the extreme irregularity of its design, through which it gains in picturesqueness what it loses in dignity. Besides the towers, it has several fine porches, great tanks approached by flights of stone steps, and the “hall of the thousand columns.” This latter contains actually 540 columns, most of them elaborately carved, arranged in twenty rows. About 2 m. distant, in Little Conjeeveram, is the Vadaraja-swami Vaishnava temple, also of the 12th century. It is beautifully situated on a wonderfully rich treasury of votive jewels. A mark on the wall of the inner enclosure, something like a horseshoe, is held to be the first letter of the name of Vishnu. For a century or more the Tangalai and Vadagalai sects, connected with the worship of the temple, have been quarrelling fiercely as to the form of this symbol; the questions arising out of this led to much litigation, and though final judgment was given by the privy council, the matter still constitutes a danger to the peace. The general aspect of the city is pleasing, with low houses and broad streets lined with fine trees. Its only noteworthy industry is the weaving of the superior silk and cotton sari worn by native women.

Conjeeveram, a British corruption of Kanchipuram (the golden city), is very ancient, having been in the early centuries of the Christian era the capital of the Pallava dynasty. The Chinese traveller Hsüan Tsang, who visited it in the 7th century, says that it was then 6 m. in circumference and inhabited by a people superior to any he had met in India—men of courage, love of justice and reverence for the law. The city was known to the Chola, who held it until their overthrow by the Mussulmans in 1310, after which it fell under the sway of the kings of Vijayanagar. In 1646 it was taken from them by the Mussulmans, who in their turn were ousted by the Maharrats in 1677. Shortly afterwards the emperor Aurungzeb’s forces retook the place, which remained in Mussulman hands until 1752, when it was captured by Clive.

CONJUGAL RIGHTS, those rights which a husband and wife (Lat. conjus) have to each other’s society. When either party continues to resist the rendering of these rights, they may be enforced by a suit for the restitution of conjugal rights. In England the jurisdiction which the old ecclesiastical courts exercised to enforce this right was transferred to the divorce court by the Matrimonial Causes Act 1857. The procedure is by citation and petition, but, before a petition can be filed, a written demand must be made to the refusing party for cohabitation. Previous to the Matrimonial Causes Act 1864, disobedience to a decree for the restitution of conjugal rights rendered the refusing party liable to attachment and imprisonment. The act of default of the subject of the petition, if the wife be the petitioner, an order for periodical payments by the husband to the wife. Failure to comply with a decree for restitution is deemed to be desertion, and a sentence of judicial separation may be pronounced, although the period of two years prescribed by the act of 1857 may not have expired. Conjugal rights cannot be enforced by the act of either party (R. v. Jackson, 1891, 1 Q.B. 671), the proper procedure being to apply to the court for relief.

CONJUNCTION (from Lat. conjungere, to join together), a general term signifying the act or state of being joined together. It is used technically in astronomy and grammar. In astronomy, "conjunction" is the nearest apparent approach of two heavenly bodies which seems to pass each other in their courses—said to be in longitude, right ascension, &c., when they have the same longitude, &c. A superior conjunction is one in which the lesser body is beyond the greater, especially when a planet is beyond the sun. An inferior conjunction is one in which a planet is on our side of the sun. In grammar the term "conjunction" is applied to one of the so-called "parts of speech," viz. those words which are used to "join together" words, clauses or sentences. Conjunctions are variously classified according to their specific function, e.g. adversative ("but," "though") which contrast, illative ("therefore") where the second clause or sentence is an inference from the first, temporal where a time-reference is expressed, and so forth.

CONJURING, the art, sometimes called White or Natural Magic, and long associated with the profession of "magician," consisting of the performance of tricks and illusions, with or without apparatus. Historically this art has taken many forms, and has been mixed up with the use of what now are regarded as natural though obscure physical phenomena. The employment of purely manual dexterity without mechanical apparatus may be distinguished as legerdemain, prestidigitation or sleight of hand.

Whether or not the book of Exodus makes the earliest historical reference to this form of natural "magic" when it records how the magicians of Egypt imitated certain miracles of Moses "by their enchantments," it is known that the Egyptian hierophants, as well as the magicians of ancient Greece and Rome, were accustomed to astonish their dupes with optical illusions, visible representations of the divinities and subdainties passing before the spectators in dark subterranean chambers. The principal optical illusion employed in these effects was the throwing of spectral images upon the smoke of burning incense by means of concave metal mirrors. But according to Hippolytus (Ref. Om. Hier. iv, 35), the desired effect was often produced in a simpler way, by causing the dupe to look into a cellar through a basin of water with a glass bottom standing under a sky-blue ceiling, or by figures on a dark wall drawn in inflammable material and suddenly ignited. The flashes of lightning and the rolling thunders which sometimes accompanied these manifestations were sometimes tricked in a similar way, the illusion of fire and thunder was produced by the reflection of light upon the wall and the shaking of a sheet of metal. The ancient methods described by Hippolytus (iv, 32) were very similar.

Judging from the accounts which history has handed down to us, the marvels performed by the phalangists of antiquity were very skilfully produced, and must have required a considerable practical knowledge of the art. The Romans were in the habit of giving conjuring exhibitions, the most favourite being that of the "cups and balls," the performers of which were called acetabularii, and the cups themselves acetabula. The balls used, however, instead of being the convenient light cork ones employed by modern conjurers, were simply round white pebbles which must have added greatly to the difficulty of performing the trick. The art survived the barbarism and ignorance of the middle ages; and the earliest professors of the modern school were Italians such as Jonas, Androletti and Antonio Carlotti. But towards the close of Elizabeth’s reign conjurers were classed with "ruffians, blasphemers, thieves, vagabonds, Jews, Turks, heretics, pagans and sorcerers." The history of conjuring by mechanical effects and inventions is full of curious but often confusing developments of moving objects, similar to those of the camera or magic lantern, were described in the 14th and 16th centuries. Thus, in the House of Fame, bk. i., Chaucer speaks of "appearances such as the subtill tregetours perform at feastes"—pictorial representations of hunting, falconry and knights jousting, with the persons and objects instantaneously disappearing; exhibitions of the same kind are mentioned by Sir John Mandeville, as seen by him at the court of "the Great Chan" in Asia; and in the middle of the 16th century Benvenuto Cellini saw phantasmagoric spectres projected upon smoke at a nocturnal exhibition in the Colosseum at Rome. The existence of a camera obscura at this latter date
is a fact; for the instrument is described by Baptista Porta, the Neapolitan philosopher, in his *Magia Naturalis* (1558). And the doubt how such apparent effects could have been produced in the 14th century, when the lantern itself is alleged to have been invented by Athanasius Kircher in the middle of the 17th century, is set at rest by the fact that glass lenses were constructed at the earlier of these dates.—Roger Bacon, in his *Discovery of the Miracles of Art, Nature and Magic* (about 1260), writing of glass lenses and perspectives so well made as to give good telescopic and microscopic effects, and to be useful to old men and those who have weak eyes. Towards the end of the 18th century Comus, a French conjurer, included in his entertainment a figure which suddenly appeared and disappeared about three ft. above a table,—a trick explained by the circumstance that a concave mirror was among his properties; and a contemporary performer, Robert, exhibited the raising of the dead by the same agency. Early in the 19th century Philipstall gave a sensation to his magic lantern entertainment by lowering unperceived between the audience and the stage a sheet of gauze upon which fell the vivid moving shadows of phantasmagoria.

A new era in optical tricks began in 1865 when John Nevil Maskelyne (b. 1839), of Cheltenham, invented a wood cabinet in which persons vanished and were made to reappear, although it was placed upon high feet, with no passage through which a person could pass from the cabinet to the stage floor, the scene, or the ceiling; and this cabinet was examined and measured for concealed space, and watched round by persons from the audience during the whole of the transformations. The general principle was this: if a looking-glass be set upright in the corner of a room, bisecting the right angle formed by the walls, the side wall reflected will appear as if it were the back, and hence an object may be hidden behind the glass, yet the space seem to remain unoccupied. This principle, however, was so carried out that no sign of the existence of any mirror was discernible under the closest inspection. Two years later the same simple principle appeared in "The Cabinet of Proteus," patented by Tobin and Pepper of the Polytechnic Institution, in which two mirrors were employed, meeting in the middle, where an upright pillar concealed their edges. In the same year Stodare exhibited the illusion in an extended form, by placing the pair of mirrors in the centre of the stage, supported between the legs of a three-legged table having the apex towards the audience; and as the side walls of his stage were draped exactly like the back, reflection showed an apparently clear space below the table top, where in reality a man in a sitting position was hidden behind the glasses and exhibited his head ("The Sphinx") above the table. The plane mirror illusion is so effective that it has been reproduced with modifications by various performers. In one case a living bust was shown through an aperture in a looking-glass sloping upward from the front towards the back of a curtained cabinet; in another a person stood half-hidden by a vertical mirror, and imitation limbs placed in front of it were suffered and removed; and in the other case a large vertical mirror was pushed forward from a back corner of the stage, the angle of view now 45 degrees, to cover the entrance of a living "phantom," and then withdrawn. Maskelyne improved upon his original cabinet by taking out a shelf which, in conjunction with a mirror, could enclose a space, and thus left no apparent place in which a person could possibly be hidden. He introduced a further mystification by secretly conveying a person behind a curtain screen, notwithstanding that, during the whole time, the existence of a clear space under the stool upon which the screen is placed is proved by performers continually walking round. The principle of reflecting by means of transparent plate-glass the images of highly-illuminated objects placed in front, so that they appear as if among less brilliantly lighted objects behind the glass, was employed in the "ghost" illusions of Sylvester, of Dircks and Pepper, of Robin, and of some other inventors,—the transparent plate-glass being, in some cases, inclined forwards so as to reflect a limed-lighted object placed below the front of the stage, and in other arrangements set vertically at an angle so as to reflect the object from a lateral position.

Among the acoustic wonders of antiquity were the speaking heads of Orpheus, the golden virgins, whose voices resounded through the temples of Delphi, and the like; Hippolytus (iv. 4) explains the trick of the speaking head published by Sir Robert Fludd. In his day, the voice being really that of a concealed assistant who spoke through the flexible gullet of a crane. Towards the close of the 10th century Gerbert (Pope Silvester II.) constructed (says William of Malmesbury) a brazen head which answered questions; and similar inventions are ascribed to Roger Bacon, Albertus Magnus, and others. In the first half of the 17th century the philosopher Descartes made a speaking figure which he called his daughter Franchina; but the stupendous captain of a vessel had it thrown overboard. In the latter part of the same century Thomas Iron, an Englishman, exhibited at the court of Charles II. a wooden figure with a speaking-trumpet in its mouth; and questions whispered in its ear were answered through a pipe secretly communicating with an apartment wherein was a learned priest able to converse in various languages. Johann Beckmann, in his *History of Inventions* (about 1770, Eng. transl. by W. Johnston, 4th ed., 1846), relates his inspection of a speaking figure in the possession of the late Sir James Yeo, an Englishman, who had a confederate who held a card of signs by which he received intelligence from the exhibitor. Somewhat later was shown in England the figure of an infant suspended by a ribbon, having a speaking-trumpet in its mouth,—an illusion in which two concave mirrors were employed, one of them concentrating the rays of sound into a focus within the head of the figure; and the mirror nearest the figure was hidden by a portion of the wall-paper which was perforated with pin-holes. In 1783 Giuseppe Pinetti de Wildalle, an Italian conjuror of great originality, exhibited among his many wonders a toy bird perched upon a bottle, which fluttered, blew out a candle, and warbled any melody proposed or improvised by the audience,—doing this also when removed from the bottle to a table, or when held in the performer's hand upon any part of the stage. The sounds were produced by a confederate who imitated song-birds after Rossignol's manner by means of the inner skin of the mouth; and speaking-trumpets directed the sounds to whatever position was occupied by the bird. About the year 1825 Charles, a Frenchman, exhibited a copper globe, carrying four speaking-trumpets, which was suspended in a light frame in the centre of a room. Whispers uttered near to this apparatus were heard by a confederate in an adjoining room by means of a tube passing through the frame and the floor, and answers issued from the trumpets in a loud tone. Subsequently appeared more than one illusion of a similar order, in which the talking and singing of a distant person issued from an isolated head or figure by aid of ear-trumpets secretly contained within parts in which, from their outside form, the presence of such instruments would not be suspected. It is probable that the automaton trumpeters of Friedrich Kaufmann and of Johann Nepomuk Mülzel were clever deceptions of the same kind. As described in the *Journal de Mode*, 1809, Mülzel's life-size figure had the musical instrument constructed in it, and when the hand was wound up, and a series of marches, army calls, and other compositions was performed, accompaniments being played by a real band. Mechanical counterparts of the human lips, tongue and breath, both in speech and in playing certain musical instruments, have, however, been constructed, as in Jacques de Vaucanson's celebrated automaton flute-player, which was completed in 1736; the same mechanician's tambourine and flute-player, which was still more ingenious, as, the flute-player having only three holes, some of the notes were produced by half-stopping; Abbé Mical's heads which articulated syllables, and his automata playing upon instruments; Kempelen's and Kratzenstein's speaking-machines, in the latter part of the 18th century; the speaking-machine made by Fabermann of Vienna, closely imitating the human voice, with a fairly good pronunciation of various words; the automaton clarinet-player constructed by Van Oeckelen, a Dutchman, and exhibited in New York in 1860, which played airs from a barrel like that of a crank-organ, and could take the clarinet from its mouth and replace it, and...
Maskelyne’s two automatons, “Fanfare” (1878) playing a cornet, and “Labiai” (1879) playing a euphonium, both operated by mechanism inside the figures and supplied with wind from a bellows placed separately upon the stage.

Lucian tells of the magician Alexander in the 2nd century that he received written questions encased in sealed envelopes, and a few days afterwards delivered written responses in the same envelopes, with the seals apparently unbroken; and both he and Hippolytus explain several methods by which this could be effected. In this deception we have the germ of “spirit-reading” and “spirit-writing,” which, introduced in 1840 by John Henry Anderson, “The Wizard of the North,” became common in the répertoire of modern conjurors,—embracing a variety of effects from an instantaneous substitution which allows the performer or his confederate to see what has been secretly written by the audience. The so-called “second-sight” trick depends upon a system of signalling between the exhibitor, who moves among the audience collecting questions to be answered and articles to be described, and the performer, who is blindfolded on the stage. As already stated, the speaking figure which Stock showed to Professor Beckmann, at Göttingen, about 1770, was instructed by a code of signals. In 1783 Pinetti had an automaton figure about 18 in. in height, named the Grand Sultan or Wise Turk, which answered questions as to chosen cards and many other things by striking upon a bell, intelligence being communicated to a confederate by an ingenious ordering of the words, syllables or vowels in the questions put. The teaching of Mesmer and the feats of clairvoyance suggested to Pinetti a more remarkable performance in 1785, when Signora Pinetti, sitting blindfold in a front box of a theatre, replied to questions and displayed her knowledge of articles in the possession of the audience. Half a century later this was developed with greater elaboration, and the system of telegraphing cloaked by intermixing signals on other methods, first by Robert-Houdin in 1846, then by Herrmann in 1848, and by Anderson at a later period. Details of the system have been given in another largest number of answers by slight and unperceived variations in the form of questions are given by F. A. Gandon, La seconde vue dévoilée (Paris, 1849).

Fire tricks, such as walking on burning coals, breathing flame and smoke from a gall-nut filled with an inflammable composition and wrapped in tow, or dipping the hands in boiling pitch, were known in early times, and are explained by Hippolytus (iv. 33). At the close of the 17th century Richardson astonished the English public by chewing ignited coals, pouring melted lead (really quicksilver) upon his tongue and swallowing melted glass. Strutt, in Sports and Pastimes of the People of England, relates how he saw Powel the fire-eater, in 1762, broil a piece of beefsteak laid upon his tongue,—a piece of lighted charcoal being placed under his tongue which a spectator blew upon with a bellows till the meat was sufficiently done. This he broiled, melted and mixed with the pieces of glass and lead out of an iron spoon, the stuff blazing furiously. These performers anointed their mouths and tongues with a protective composition.

Galen speaks of a person in the 2nd century who delighted a blown-out candle by holding it against a wall or a stone which had been rubbed with sulphur and naphtha; and the instantaneous lighting of candles became a famous feat of later times. Baptista Porta gave directions for performing a trick entitled “many candles shall be lighted presently.” Thread is boiled in oil with brimstone and oplont, and when dry bound to the wicks of candles; and, one being lighted, the flame runs to them all. He says that on festival days they are wont to do this among the Turks. “Some call it Hermes his ointment.” In 1783 Pinetti showed two figures sketched upon a wall, one of which put out a candle, and the other relighted the hot wick, when the candle was held to their mouths. By wafer he had applied the grains of gunpowder to the mouth of the first, and a bit of phosphorus to that of the other. A striking trick of this conjurer was to extinguish two wax candles and simultaneously light two others at a distance of 3 ft., by firing a pistol.

The candles were placed in a row, and the pistol fired from the end where the lighted candles were placed; the sudden blast of hot gas from the pistol blew out the flame and lighted the more distant candles, because in the wick of each was placed a millet-grain of phosphorus. A more recent conjurer showed a pretty illusion by appearing to carry a flame invisibly between his hands from a lighted to an unlighted candle. What he did was to hold a piece of wire for a second or two in the flame of the first candle, and then touch with the heated wire a bit of phosphorus which had been inserted in the turpentine-wetted wick of the other. But in 1842 Ludwig Döhler, a German conjurer of much originality, surprised his audience by lighting two hundred candles instantaneously upon the firing of a pistol. This was the earliest application of electricity to stage illusions. The candles were so arranged that each wick, black from previous burning, stood a few inches in front of a fine nozzle gas-burner projecting horizontally from a pipe of hydrogen gas, and the two hundred jets of gas passed through the same number of gaps in a conducting-wire. An electric current leaping in a spark through each jet of gas ignited all simultaneously, and the gas flames fired the candle wicks.

J. E. Robert-Houdin (1805-1871), who opened his “Temple of Magic” at Paris in 1845, originated the application of electromagnetism for secretly working or controlling mechanical apparatus in stage illusions. His Sujets fantastiques at Paris gave him such a reputation that the French government actually sent him to Algiers in order to show his superiority to the local marabouts; and he ranks as the founder of modern conjuring. He first exhibited in 1845 his light and heavy chest, which, when placed upon the broad plank or “rake” among the spectators, and exactly over a powerful electromagnet hidden under the cloth covering of the plank, was held fast at pleasure. In order to divert suspicion, Houdin showed a second experiment with the same box, suspending it by a rope which passed over a small pulley attached to the ceiling; but any person in the audience could feel the sudden increase in weight when the rope was pulled tight, and the weight of the box was unaware that the rope was passing across it and appearing to pass simply over the pulley, really passed upward over a winding-barrel worked as required by an assistant. Remarkable ingenuity was displayed in concealing a small electromagnet in the handle of his glass bell, as well as in his drum, the electric current passing through wires hidden within the cord by which these articles were suspended. In one of Houdin’s illusions—throwing eight half-crowns into a crystal cash-box previously set swinging—electricity was employed in a different manner. Top, bottom, sides and ends of an oblong casket were of transparent glass, held together at all the edges by a light metal frame. The coins were concealed under an opaque design on the lid, and supported by a false lid of glass, which was tied by cotton thread to a piece of platinum wire. Upon connecting the electric circuit, the platinum, becoming red-hot, severed the thread, letting fall the glass flap, and dropping the coins into the box.

Down to the latter part of the 18th century no means of secretly communicating ad libitum motions to apparently isolated pieces of mechanism had superseded the clumsy device of packing a confederate into a box on legs draped to look like an unsophisticated table. Pinetti placed three horizontal levers close beside each other in the top of a thin table, covered by a cloth, these levers being actuated by wires passing through the legs and feet of the table and to the confederate behind a scene or partition. In the pedestal of each piece of apparatus which was to be operated upon when set loosely upon the table were three corresponding levers hidden by cloth; and, after being examined by the audience, the piece of mechanism was placed upon a table in such a position that the two sets of levers exactly coincided, one being superimposed upon the other. In one “effect” the confederate worked a small bellows in the base of a lamp, to blow out the flame; in another he let go a trigger, causing an arrow to fly by a spring from the box of a doll sportsman; he actuated a double-bellows inside a bottle, which caused flowers and fruit to protrude from among the foliage of an
CONJURING

946

artificial shrub, by distending with air a number of small bladders shaped and painted to represent them; he opened at shut valves which allowed balls to issue out of various doors in a model house as directed by the audience; and he moved the tiny bellows in the body of a toy bird by which it blew out a candle. Other conjurors added more complicated pieces of apparatus,—one being a clock with small hand moving upon a glass disk as required by the audience. The glass disk carrying the numbers or letters was in reality two, the back one being isolated by ratchet teeth on its periphery hidden by the ring frame which supported it, and, though the pillar-pedestal was separated into three pieces and shown to the spectators, movable rods, worked by the table levers, were in each section duly covered by cloth faces. Another mechanical trick, popular with Torrini, Houdin, Philippe and Robin, and worked in a similar way, was a little harlequin figure which rose out of a box set upon the table, put his legs over the front of the box and sat on the edge, nodded his head, smoked a pipe, blew out a candle, and whistled a note obligato to an orchestra. Robert-Houdin employed, instead of the table levers, vertical rods each arranged to rise and fall in a tube, according as it was drawn down by a spiral spring or pulled up by a rope which passed over the whole length of the table and so down the table leg to the hiding-place of the confederate. In his centre table he had ten of these “pistons,” and the ten cords passing under the floor of the stage terminated at a keyboard. Various ingenious automatons were actuated by this means of transmitting motion; but the most elaborate piece of mechanical apparatus constructed by Houdin was his orange tree. The oranges, with one exception, were real, stuck upon small spikes, and concealed by hemispherical screens which were covered with foliage; and the screens, when released by the upward pressure of a piston, made half a turn, and disclosed the fruit. The flowers were hidden beneath foliage until raised above the leaves by the action of another piston. Near the top of the tree an artificial orange opened into four portions; while two butterflies attached to two light arms of brass rose up behind the tree, appeared on each side by the spreading of the arms, and drew out of the opened orange a handkerchief which had been borrowed and vanished away.

Many of the illusions regarded as the original inventions of early conjurers have been improved and extended. Hocus Fucus Junior. The Anatomy of Legerdemain (4th ed., 1654) gives an explanatory cut of a method of drawing different liquors out of a single tap in a barrel, the barrel being divided into compartments, each having an air-hole at the top, by means of which the liquid in any of the compartments was withheld or permitted to flow. Robert-Houdin applied the principle to a wine-bottle held in his hand from which he could pour four different liquids regulated by the unstoppling of any of the four tiny air-holes which were covered by his fingers. A large number of very small liqueur glasses being provided on trays, and containing drops of various flavouring essences, enabled him to supply imitations of various wines and liquors, according to the glasses into which he poured syrup from the bottle; while by a skilful substitution of a full bottle for an empted one, or by secretly refilling in the act of emptying the bottle with a cloth, he produced the impression that the bottle was “inexhaustible.” In 1835 was first exhibited in England a trick which a Brahman had been seen to perform at Madras several years before. Taking Lau Laro sat cross-legged upon nothing,—one of his hands only just touching the floor,—he tooled upon a genuine hollow bamboo which was set upright in a hole on the top of a wooden stool. The placing of the performer in position was done behind a screen; and the explanation of the mysterious suspension is that he passed through the bamboo a strong iron bar, to which he connected a support which, concealed by the beard, his hand and his dress, upheld his body. In 1849 Robert-Houdin reproduced the idea under the title of etherial suspension,—professedly rendering his son’s body devoid of weight by admitting vapour of ether to his nose, and then, in sight of the audience, laying him in a horizontal position in the air with one elbow resting upon a staff resembling a long walking-stick. The support was a jointed iron frame under the boy’s dress, with cushions and belts passing round and under his body. Subsequently the trick was improved upon by Sylvester,—the suspended person being shown in several changes of position, while the sole supporting upright was finally removed. For the latter deception the steel upright was made with polished angular faces, apex towards the spectators, and acted in a dim light on the same principle as the mirrors of a Sphinx table. Before lowering the light, the reflector bar is covered by the wood staff set up before it.

The mysterious vanishing or appearing of a person under a large extinguisher upon the top of a table, and without the use of mirrors, was first performed by Comas, a French conjurer very expert in the cups-and-balls sleight-of-hand, who, appearing in London in 1780, announced that he would convey his wife under a cup in the same manner as he would balls. The feat was accomplished by means of a trap in a box table. Early in the 19th century Chalons, a Swiss conjuror, transformed a bird into a young lady, on the same principle. In 1836 Sutton varied the feat by causing the vanished body to reappear under the crown of a great pie. Houdin “vanished” a person standing upon the table’s edge, with a handkerchief, about his person, which was thick; but there was a false top which was let down like the lid of a bellows, this distension being hidden by a table-cloth hanging sufficiently low for the purpose, and the person, when covered by the extinguisher, entered the table through a trap-door opening upwards. Robin, in 1851, added to the wonder of the trick by vanishing two persons in succession, without any possibility of either escaping from the table,—the two persons really packing themselves into a space which, without clever arrangement and practice, could not hold more than one. The sword-and-basket trick was common in India many years ago. In one form it consisted in inverting an empty basket over a child upon the ground; after the child had secreted himself between the basket-bottom and a belt concealed by a curtain painted to look like the actual wicker bottom, a sword was thrust through both sides of the basket, the child screaming, and squeezing upon the sword and upon the ground a blood-coloured liquid from a sponge. When the performer upset the basket, the child could not be seen; but another child similarly prepared seemingly appeared among the spectators, having been up to that time supported by a pair of stilts under the cloak of a confederate among the bystanders. In another form an oblong basket is used large at the bottom and tapering to the top, with the lid occupying only the central portion of the top, and the child is so disposed round the basket that the sword plunged downward avoids him, and the performer can step inside and stamp upon the bottom to prove that the basket is empty. In 1865 Stodare introduced the trick into England, but in a new manner. Upon light trestles he placed a large oblong basket; and after a lady attired in a profuse muslin dress had composed herself and her abundance of skirt within, and the lid had been shut and the sword plunged through the sides, the basket was tilted towards the audience to show that it was empty, and the lady reappeared in a gallery of the hall. The basket was formed with an outer shell to turn down, leaving the lady with her dress packed together lying upon the basket bottom and behind what had formed a false front side,—the principle being the same as in the clown’s box, which, when containing a man, is rolled over to display the inside empty. The reappearing lady was thus achieved.

Among the most meritorious and celebrated mechanical illusions have been automaton figures secretly influenced in their movements by concealed operators. In the 17th century M. Raisin, organist of Troyes, took to the French court a harpsichord which played airs as directed by the audience; but, upon opening the instrument, Louis XIV. discovered a youthful performer inside. In 1769 Baron Kempelen, of Pressburg, in Hungary, completed his chess-player, which for a long time remained the puzzle of Europe. It was an illusion,—the merit consisting in the devices by which the confederate player was hidden in the cabinet and body of the figure, while the interior
was opened in successive instalments to the scrutiny of the spectators. The first player was a Polish patriot, Worousky, who had lost both legs in a campaign; as he was furnished with artificial limbs when in public, his appearance, together with the fact that no dwarf or child travelled in Kemple's company, dispelled the suspicion that any person could be employed inside the machine. This automaton, which made more than one tour to the capitals and courts of Europe, and was owned for a short time by Napoleon I., was exhibited by Mälzel after the death of Kemple in 1819, and ultimately perished in a fire at Philadelphia in 1854. A revival of the trick appeared soon afterwards in Hooper's "Ajeel," shown at the Sydenham Crystal Palace and elsewhere. A chess-playing figure, "Mephisto," designed by Gumpel, was also exhibited. No space existed for the accommodation of a living player within; but, as there was no attempt at isolating the apparatus from mechanical communication through the carpet or the floor, there was nothing to preclude the moving arm and gripping finger and thumb of the figure from being worked by any convenient connexion of threads, wires, rods and levers. In 1875 Maskelyne and Cooke produced at the Egyptian Hall a small automaton whist-player, "Psycho," which, from the manner in which it was placed upon the stage, appeared to be perfectly isolated from any mechanical communication from without; there was no room within for the concealment of a living player by aid of any optical or other illusion, and yet the free motions of both arms, especially of the right arm and hand in finding any card, taking hold of it, and raising it or lowering it to any position and at any speed as demanded by the audience, indicated that the actions were directed from without. The arm had all the complicated movements necessary for chess or draughts playing; and "Psycho" calculated any sum up to a total of 90,000,000.

A still more original automaton was Maskelyne's figure "Zoe," constructed in 1877, which wrote and drew pictures at dictation of the audience. "Zoe," a nearly life-size but very light doll, sat loose upon a cushioned skeleton-stand, of which the solid feet of the plinth rested upon a thick plate of clear glass laid upon the floorcloth or carpet of the stage. "Psycho," a smaller oriental figure, sitting cross-legged on a box, was supported by a single glass cylinder of clear glass, which, as originally exhibited, stood upon the carpet of the stage, but was afterwards set loose upon a small stool, having solid wood feet.

That a mysterious and apparently elaborate mechanical movement may, after all, possess the utmost simplicity is illustrated by the familiar conjuring trick known as "rising cards." Four cards having been chosen by the audience and returned to the pack, this is placed end upwards in a glass goblet, or in a thin case not deep enough to hide the pack, upon the top of a decanter or upon a stick. At command, the cards rise, one at a time, out of the pack; one rises part of the way and sinks back again; one rises quickly or slowly as directed; one comes out feet first, and, on being put back, rises head upwards like the others; and one dances in time to music, and finally jumps out of the pack. At the conclusion there remain only the goblet or the case and the cards, subject to the minutest examination of any one from the audience, without a trace of moving mechanism visible. This was one of the chief feats of Louis Christopher Comte, the French conjurer and ventriloquist, at the end of the 18th century, and in varied forms has been popular to the present day. Probably it was suggested by the earlier device of the golden head dancing in a glass tumbler, which is described in The Conjuror Unmasked (1790). Several crown pieces were put in the glass, a small gilded head above them, and a plate or other flat cover laid upon the mouth of the glass; yet the head thus isolated jumped inside the glass so as to count numbers and answer questions. The secret communicator of motion was a fine silk thread attached to the head and passing through a tiny notch cut in the lip of the glass, and so to a confederate who pulls it. In the case of the rising cards the whole of the movements are effected by arranging a single silk thread in the previously prepared pack, passing over some cards and under others, and led behind the decanter or other support to the stage and thence to the confederate. As this infinitely simple mechanical agent is drawn altogether out of the pack after the last card has risen, literally no trace remains of any means of communicating motion to the cards.

Oriental ingenuity, which furnished the original idea of the ethereal suspension trick, contributed the Chinese rings introduced into England in 1834; also the Chinese feat of producing a bowl of water with gold-fish out of a shawl, first seen in England in 1845, and the Indian rope-tying and sack feats upon which the American brothers Davenport founded a distinct order of performances in 1839. Their quick escape from rope bonds in which they were tied by representatives of the audience, the instantaneous removal of their coats in a dark seance, leaving themselves still bound, and their various other so-called "phenomena" were exposed and imitated by Maskelyne, who, in 1890, greatly surpassed any feats which they had accomplished. He proceeded to exhibit himself floating in the air, to show "materialized spirit forms," and to present a succession of wonders of the spirit mediums in novel performances. One of Maskelyne's cleverest inventions was the box which he constructed in 1835; it closely fitted when he packed himself in a cramped position within; it was enclosed in a canvas wrapper, corded with any length and complicated meshing of rope, and the knot sealed, yet his escape was effected in seven seconds. Taking more time, he performed the converse of these operations except the sealing. Provided with the wrapper and the open box, himself standing outside, he drew a curtain before him to conceal the modus operandi, and in a few minutes was found in the box, which, though so small as to permit no limb to be moved more than a few inches, he nevertheless wrapped and corded as exactly as if he had operated from the outside.

Modern conjuring has given rise to many interesting developments, but none perhaps attracted a larger share of public attention than the legal battle in the last years of the century over this box-trick. The case had a special interest in England, from the fact that it was the only one in which a trick had ever occupied the attention of the House of Lords. The litigation arose in this way. Mr Maskelyne had been in the habit of offering a considerable reward to any one who could produce a correct imitation of his box-trick. The offer was a direct challenge to imitators, and was intended to show—as nothing else could have done—that the tricks sold and exhibited as "correct imitations" were not what they professed to be. Two amateur mechanicians, having made or procured a box externally resembling Mr Maskelyne's, gave a private performance before a few friends, and then claimed the reward. Mr Maskelyne refused to pay, his contention being that hundreds of people had already escaped from locked and corded boxes resembling his in appearance. Indeed, it was for that very reason that he had been compelled to make the offer. The claimants then brought an action to recover £500—the amount offered. Mr Maskelyne produced his box in court, and challenged the plaintiffs to expose the secret, contending that they could not possibly imitate correctly a trick of which they did not know the secret. Their point, however, was that they had nothing to do with the secret, and that a box-trick was not a trick-box. The jury, being unable to decide whether a mechanical trick is a piece of mechanism or the effect it produces, could not agree, and were discharged. In a second trial, the jury, after much deliberation, found for the plaintiffs. Mr Maskelyne appealed against the verdict. His appeal occupied the court for three days, and was dismissed. Finally he carried the case to the House of Lords, and lost it. The majority of the law lords, while fully admitting that the secret had never been discovered, were of opinion that the trick had been correctly "imitated." To people dealing with mechanical devices this decision is bound to appear not a little curious. A mechanical trick is a mechanical invention, and when we have two absolutely different inventions, although they may produce more or less similar results, one is by no means an imitation of the other—to say nothing of a "correct imitation." Applied to inventions generally, such a ruling would produce disastrous results.

To those interested in magic, however, one effect of the
CONJURING

litigation was to intensify the mystery surrounding the original box-trick. The whole matter has been publicly thrashed out. It has been learned that the trick, generally, consists of a movable panel fastened by a secret catch. Provided that the rope be not too severely knotted over that panel, the performer can escape; but otherwise failure is inevitable. Further, it is known that the original trick has never failed, even under the most severe tests, whereas the imitations have failed repeatedly. There can only be one reason for this—a great difference in the mechanical principles employed.

Like most forms of refined entertainment the conjuror's magic appears to have kept well abreast of the times. Certainly, at no period of the world's history has it ever been so popular as at present. As a natural consequence, so many skilled exponents of the art have never before existed. Yet there is one respect in which the present day conjuring shows no advance upon the records of earlier times. The one great peculiarity in connexion with magic, at every period, has been the limited number of those who prove themselves capable of originating magical effects. This peculiarity has never been more thoroughly emphasized than at present. Since the days of Robert-Houdin, only two men have attained any remarkable degree of prominence—Mr Maskelyne and M. Buatier de Kolta. There are many who, as entertainers, are entitled to rank with the highest, but to those two only can prominence be justly given as originators. The only logical conclusion to be drawn is that to invent original illusions is a matter of no ordinary difficulty, and, indeed, all who have attempted work of that kind will admit that such is the case. When, however, an original principle has been invented, it may be utilized in producing many and apparently quite distinct effects. As an example of this, Maskelyne's "Cleopatra's Needle," invented in 1879, may be mentioned. The trick consisted of a piece of mechanism representing an exceedingly light model of the famous obelisk. So light was it, in fact, that it could easily be lifted with one hand. Upon an isolated stand, previously examined by the audience, a sheet of ordinary brown paper was laid, and on this the "needle" was placed. Thus during the performance communication with the obelisk was obviously impossible. Yet from within it human beings emerged in a most startling manner. The secret consisted in the fact that the "needle" was capable of being lifted by invisible means, and from the outset contained two or three persons concealed within it. Notwithstanding the fact that this illusion was one of Mr Maskelyne's simplest devices, it puzzled even experts for a considerable time. When at last the secret leaked out, the principle was seized upon with avidity and utilized in a variety of ways—for example, by M. Buatier de Kolta in his beautiful illusion, "The Cocoon," first produced at the Egyptian Hall, London, in 1887. In this case de Kolta had the advantage of Mr Maskelyne's assistance in perfecting the mechanical details. de Kolta's smaller tricks have for years supplied the whole army of ordinary conjurers with novelties. In 1886, at the Eden Theatre, Paris, he introduced his famous illusion known as "The Vanishing Lady." This mystery, performed as he alone could perform it, was one of the most effective tricks ever exhibited. Hundreds of "imitations" were, of course, produced; but, like the imitations of Mr Maskelyne's box, they sink into insignificance when compared with the original; and in this case, unfortunately for the originator, the reputation of the original was speedily ruined by clumsy exponents, who only succeeded in exposing the principle. The effect produced by de Kolta was as follows:—Taking from his pocket what appeared to be an ordinary newspaper, folded, he opened it out and laid it upon the stage. Then a chair was shown, front and back, to the audience, and placed upon the paper. Madame de Kolta, in ordinary evening dress, then took her seat upon the chair, and a large piece of black silk was thrown over her, enveloping her from head to foot. Then de Kolta would shout, "I'll throw you in the air!"—or words to that effect—and to all appearance he grasped her round the waist, lifted her above his head, and she vanished, covering all, at his finger-tips.

Among the illusions depending for their effect upon sudden disappearance, perhaps the most inexplicable was that produced by Mr Maskelyne in 1881 under the appropriate title of "Oh!"—that being an expression frequently used by spectators upon witnessing the startling effect. In the illusion the performer whose disappearance was to be effected seated himself upon a raised couch, above which a kind of canopy was supported upon brass rods. From the canopy depended curtains capable of being raised or lowered. The right hand of the performer was strapped to one end of this couch, and the left hand was secured by means of a strap attached to one end of a stout cord. The other end of the cord, having been passed through a hole in the framework of the canopy, was securely held by a member of the audience. The curtains were then lowered to within 18 in. of the ground, and through an aperture in the front curtain the performer's right hand was passed. This hand, again, was held by a second member of the audience. Finally, a sheet of iron was placed beneath the couch, to prevent any possibility of the performer's escape being effected through a trap in the stage. Thus, with the performer's right hand in full view, his left hand could be drawn upwards by the cord attached to it, and a clear space below the couch, escape seemed impossible; yet, upon the word "Go!" the right hand disappeared, the cord became slack in the hands of the holder, the curtains were instantly raised, and the performer had vanished.

In 1886 M. Buatier de Kolta, in conjunction with Mr Maskelyne, presented at the Egyptian Hall, London, a series of illusionary effects upon an entirely novel principle, to which they gave the name of "Black Magic." The main idea was based upon the fact—obvious when once it is pointed out—that visible form cannot exist in the absence of shadow or varying tint. In other words, we can only distinguish forms when they exhibit either variations in colour or shade. Absolute uniformity must, necessarily, mean invisibility. To bring about this uniformity, the entire stage was draped in black velvet, giving it the appearance of a dark and immensely deep cavern. There were no lights within it, though from the front it was brilliantly illuminated. Upon the stage, thus prepared, the most startling appearances and disappearances took place, within a few feet of the footlights. The illusions were produced by the simple method of covering anything to be concealed by screens of black velvet. These could be brought almost to the front of the stage, and yet would remain invisible; thus, in an instant, persons or articles would appear, apparently from space, or would disappear into it. The principle involved in the production of these illusions was adopted subsequently by many conjurors, and has served to produce an almost endless variety of effects.

The production of innumerable blossoms from a sheet of paper was undoubtedly the prettiest of M. Buatier de Kolta's smaller tricks. A small sheet of cartridge-paper is twisted into a cone, which is shown to be empty, but immediately artificial blossoms begin to pour out of it, until quite a bushel of them are piled up. Unfortunately for the inventor, the first time he introduced the trick at the Eden Theatre, Paris, one or two of the "blossoms" were carried by a draught of air into the adjacent rooms. These were at once sold to a manufacturer of conjuring appliances, and within a few days de Kolta's "Spring Blossoms" were upon the market.

Another startling trick, by the same inventor, is "The Flying Cage." A live bird is imprisoned within a small cage, held between the performer's hands, when suddenly, by a quick movement of the arms, both bird and cage vanish. The cage simply collapses, and is drawn by a string up the coat-sleeve, the unfortunate bird being sometimes maimed, if not killed outright. The Society for the Prevention of Cruelty to Animals once took action in the matter, and sought to prevent the performance of the trick at one of the London music-halls; but the conjuror in this case invited the officials to witness a private demonstration, and was clever enough to convince them that there was no cruelty. Conjuring with animals has a great charm for young folk, and happily it is very seldom that a trick involves any cruelty whatever. The animals, as a rule, quickly
become accustomed to the business, and appear thoroughly to understand what is required of them.

In recent years the mystery known as "Second Sight" has been vastly improved. The old system, invented by Pinetti in 1785, and brought to great perfection by Robert-Houdin, has almost disappeared. It consisted of an elaborate code of signals, given by means of subtle variations in the questions put to the supposed clairvoyant; the form in which the question was put conveying the appropriate answer. Now it is customary to avoid speech altogether. The information is conveyed by means of gesture or slight sounds at varying intervals. This business requires an enormous amount of practice, and an abnormal memory on the part of those who become expert.

But there are certain tricks of this class which require little or no skill and a very small amount of practice. These are generally introduced by impostors who claim or tacitly suggest the possession of supernatural powers. The following is a very familiar example of the kind of trick employed by such persons. The performers are usually a man and a woman. The man first appears, and informs the audience that he will shortly introduce a lady possessing extraordinary powers. Not only can she read the thoughts of any person whose mind is en rapport with hers, but also she can foretell the future, trace missing friends, discover lost property, &c. In order to display the lady's capabilities, he requests that any members of the audience who have questions they would like answered will write them secretly. For convenience in writing, slips of paper, pencils and squares of thick millboard are passed round, the millboard squares being for use as writing-desks. The writers are particularly cautioned to allow no one to see what is written, but to fold up the papers and retain them in their own possession. Further, the writers are instructed that, when the clairvoyant appears, the thoughts of each must be kept intently fixed upon what he has written. The pencils and millboards are then collected, and the preparations being so far complete, other portions of the entertainment are begun. Finally, as the last item in the programme, the clairvoyant is introduced. A handkerchief, upon which some liquid has been poured, is held over the lady's nose and mouth, and apparently she falls into a trance. Then she proceeds to describe the appearance of certain of the writers, the position they occupy in the room, and the nature of the questions they have written, giving to those questions more or less plausible answers. The trick never fails to produce the most profound astonishment, and, by its means several persons have made rapid strides to fortune. But the whole business is an impudent imposture. Therefore it cannot be too often or too thoroughly exposed. It is accomplished as follows. Some of the millboards passed round for convenience in writing are built up of a number of thicknesses, fastened together at the edges only. Beneath the outer layer a sheet of carbon paper is concealed, so that the pressure of the pencil causes a reproduction in duplicate to be impressed upon an inner layer of cardboard. These prepared pads are handed to the writers, who note the dress and appearance of the persons by whom the questions are written. That information, together with the prepared pads, is subsequently conveyed to the clairvoyant. She requires a certain amount of time in order to memorize the questions and the description of the writers; consequently she is not introduced to the audience until, say, an hour has elapsed. Of course, it would not be discreet to have all the millboards prepared. Many of them, perhaps the majority, are really what they appear to be; but, needless to say, the questions written upon these are never answered. It is carefully pointed out beforehand that the clairvoyant can only read the questions of those whose minds are in sympathy with hers. That statement, naturally, serves to account for her inability to read or answer questions written by those who have used the plain millboards.

In connexion with this trick a further imposture is carried out. An inviting stranger to send, by post, any questions they wish to have answered. Such an invitation appears to be quite straightforward and genuine, but those who are sufficiently credulous or sufficiently curious to respond to the perpetration of an ingenious fraud. In reply to any such communication, the writer is informed that it is necessary for him to attend one of the public performances, and endeavour to bring his mind into harmony with that of the clairvoyant. Enclosed is a complimentary ticket entitling him to attend any performance he pleases. The procedure, then, is simply this. Each ticket bears a private mark, and a corresponding mark is put upon the letter written by the person to whom it is sent. When any marked ticket is presented, the attendant notes the dress and appearance of the visitor and the seat he occupies. That information is given to the clairvoyant, together with the ticket. She refers to the latter bearing the mark corresponding to the ticket, and ascertains what that particular visitor wishes to know. Thus to the public she appears to read and answer a question which has not been written down, but merely thought of by a total stranger. There are numerous methods of obtaining information by means similar to those already described. Sufficient, however, has been said to show that such devices are of the simplest, and require nothing more than a callous effrontery to carry them into effect. Of course, all kinds of mischances are bound to occur. But, when one is supposed to be dealing with undiscovered laws of nature, it does not require much ingenuity to wriggle out of any situation, however difficult.

Modern magic calls to its aid all the appliances of modern science—electricity, magnetism, optics and mechanics; but the most successful adepts in the art look down upon all such aids and rely upon address and slight of hand alone. The prestidigitator's motto is "The quickness of the hand deceives the eye"; but this very phrase, which is always in a performer's mouth, is in itself one of the innocent frauds which the conjuror employs as part and parcel of his exhibition. The truth is that it is not so much upon the quickness with which a feat is performed as upon the adroitness with which the time and means of performing it are concealed that its success depends. The right opportunity for executing the required movement is technically called a tempo. This is defined to be any act or movement which attracts the attention of the audience while something is being "vanished" or "produced." Experiment will readily convince any one that it is absolutely impossible to move the hand so quickly as to abstract or replace any object without being perceived, so long as the eyes of the audience are upon the performer. But it is very easy to do so unnoticed, provided the audience are looking another way at the time; and the faculty of thus diverting their attention is at once the most difficult and the most necessary accomplishment for a conjuror to acquire. It does not suffice to point, or ask them to look in another direction, because they will obviously suspect the truth and look with all the more persistence. The great requisite is to "have a good eye"—in French conjuring parlance avoir de l'œil; an earnest, convinced look of the performer in a particular direction will carry every one's glances with it, while a furtive glance at the hand which is performing some function that should be kept secret will nullify all. It is well known that the fingers often convey the movements of the hands, and hence a glance at these will immediately give away the most intricate sleight of hand.

The motto prefixed by Robert-Houdin to his chapter on the "Art of Conjuring" is—"to succeed as a conjuror, three things are essential: first, dexterity; second, dexterity; and third, dexterity"; and this is not a mere trick of language. For triple dexterity is required, not only to train the hand to the needful adroitness, but to acquire the requisite command of eye and tongue. Unfortunately this dexterity may be applied not only to conjuring but to cheating, particularly in the case of card-sharpers. It takes various forms: (1) marking the cards; (2) abstracting certain cards during the game for clandestine use; (3) previously concealing cards about the person; (4) packing the cards; (5) substituting marked or prepared packs; (6) confederacy; (7) false shuffles. All these methods are thoroughly exposed in Robert-Houdin's work Les Tricheries des Gens. The successful card-shaper must have qualifications which, if applied in a legitimate direction, would ensure distinction in almost any profession.

In the case of purely dexterical tricks, little advance has been made. Recently some new sleights were introduced from
CONKLING—CONNAUGHT, DUKE OF

America. These consist in an amplification of the method of concealing coins and cards at the back of the fingers. The principle has received the incongruous title of "back-palmizing."

By means of this method the back and front of the hand alternatively can be shown empty, while, notwithstanding its apparent emptiness, the hand nevertheless conceals a coin or card. The first and fourth fingers are caused to act as pivots, upon which the concealed articles are turned from front to back, and vice versa, the turning being performed by the second and third fingers. The movement is very rapid, and is accomplished in the art of turning over the hand to show the two sides alternately. The sleight requires an enormous amount of practice.

It has been brought to the highest state of perfection by Herr Valadon.

In all ages a very popular magical effect has been the apparent floating of a person in empty space. An endless variety of ingenious apparatus has been invented for the purpose of producing such effects, and the present article would be incomplete without some reference to one or two of the more modern examples. A very pretty illusion of this kind is that originally produced under the title of "Astarte." A lady is brought forward, and after making a bow to the audience she retires to the back of the stage, the whole of which is draped with black velvet and kept in deep shadow. There she is caused to rise in the air, to move from side to side, to advance and retire, and to revolve in all directions. The secret consists in an iron lever, covered with velvet to match the background, and therefore invisible to the audience. This lever is passed through an opening in the back curtain and attached to a socket upon the metal girdle worn by the performer. The girdle consists of two rings, one inside the other, the inner one being capable of turning about its axis. By means of this main lever and a spindle passing through it and gearing into the inner ring of the girdle, the various movements are produced. A hoop is passed over the performer with a view to demonstrate her complete isolation, but the audience is not allowed to examine it. It has a spring joint which allows it to pass the supporting lever. Among illusions of this class there is probably none that will bear comparison with the "levitation" mystery produced by Mr. Maske-lyne. A performer, in a recumbent position, is caused to rise several feet and remain stationary against the audience, while an intense light is thrown upon him, illuminating the entire surroundings. Persons walk completely round him, and a solid steel hoop, examined by the audience, is passed over him, backwards and forwards, to prove the absence of any tangible connexion.

The secrets of conjuring were for a long time jealously guarded by its professors, but in 1793 a work appeared in Paris, by M. Decamps, entitled Testament de Jerome Sharpe, professeur de physique amusante, which gives a very fair account of the methods then in vogue. In 1858 a still more important and accurate book was published—Sorcellerie ancienne et moderne expliquee, by J. N. Pousin; and in 1868 J. E. Robert-Houdin issued his Secrets de la prestidigitation et de la magie, which is a masterly exposition of the entire art and mystery of conjuring. The last-mentioned book was translated into English by Professor Louis Hoffman, the author of Modern Magic. See also Hoffman, More Magic, and Later Magic; Dobson and Sachs, Sleight of Hand; Dobson and Flatto, Magic of the Stage; Sharpe and Flatfo; (J. A. C.; G. F.; J. N. M.)

CONKLING, ROOSCE (1829-1888). American lawyer and political leader, was born in Albany, New York, on the 30th of October 1829. He was the son of Alfred Conkling (1789-1874), who was a representative in Congress from New York in 1821-1823, a Federal district judge in 1825-1832, and U.S. minister to Mexico in 1852-1853. Roscoe Conkling was admitted to the bar at Utica, New York, in 1850, was appointed district-attorney of Oneida county in the same year, and soon attained success in the practice of his profession. At first a Whig, he joined the Republican party at its formation, and was a Republican representative in Congress from 1859 to 1863. He refused to follow the financial policy of his party in 1862, and delivered a notable speech against the passage of the Legal Tender Act, which made a certain class of treasury notes receivable for all public and private debts. In this opposition he was joined by his brother, Frederick Augustus Conkling (1816-1891); at that time also a Republican member of Congress. In 1863 he resumed the practice of law, and in April 1865 was appointed a special judge advocate by the secretary of war to investigate alleged frauds in the recruiting service in western New York. He was again a representative in Congress from December 1865 until 1867, when he entered the Senate. After the war he allied himself with the radical wing of his party, was a member of the joint committee that outlined the congressional plan of reconstructing the late Confederate States, and laboured for the impeachment of President Johnson. During President Grant's administration he was a member of the senatorial coterie that influenced most of the president's policies, and in 1873 Grant urged him to accept an appointment as chief justice of the Supreme Court, but he declined. In the Republican national convention of 1876 Conkling sought nomination for the presidency, and after the disputed election of this year he took a prominent part in devising and securing the passage of a bill creating an electoral commission. In 1880 he was one of the leaders of the unsuccessful movement to nominate Grant for a third presidential term. With Grant's successors, Hayes and Garfield, his relations were not much improved by civil service reform, he came into conflict with President Hayes over the removal of Chester A. Arthur and other federal office-holders in New York; and when in 1881 President Garfield, without consulting him, appointed William H. Robertson, a political opponent of Conkling, as collector of the port of New York, and when this appointment was confirmed by the Senate in spite of Conkling's opposition, Conkling and his associate senator from New York, Thomas C. Platt, resigned their seats in the Senate and sought re-election as a personal vindication. Being unsuccessful, Conkling took up the practice of law in New York city, again declining, in 1882, a place on the bench of the Supreme Court, and appeared in a number of important cases. While in public life Conkling always attracted attention by his abilities, his keenness and eloquence in debate, his aggressive leadership and his striking personality. Though always a strenuous worker in Congress, he was not the originator of any great legislative measures, and his efficiency as a law-maker is thought to have been much impaired by his personal animosities. His hostility to James G. Blaine prevented his re-election as a senator, which was especially marked. He died in New York city on the 18th of April 1888.

CONN, LOUGH, a lake of western Ireland, in Co. Mayo. Its length (N.N.W. to S.S.E.) is 9 miles, and its extreme breadth rather over 4 miles, but two promontories projecting from opposite shores about the centre narrow it to less than 1 mile. On the south a passage so narrow as to be bridged communicates with Lough Cullin; the current through this channel, normally from Conn to Cullin, is sometimes reversed. The total length of the two loughs is nearly 12 miles. They drain eastward by a short channel tributary to the Moy, and the principal affluent is the Deel and the Manulla. Lough Conn lies 42 feet above sea-level. It contains a few islands, and its shores are generally low, but the isolated mass of Nephin (2646 feet) rises finely on the west. The lake is in favour with anglers.

CONUGHT, ARMagh, Wlliam Patrick Albert, Duke of (1850-1908), third son and seventh child of Queen Victoria, was born at Buckingham Palace on the 1st of May 1850. Being destined for the army, the young prince was entered at the Royal Military Academy, Woolwich, in 1866, and gazetted to the Royal Engineers on the 19th of June 1868. In the following November he was transferred to the Royal Artillery, and on the 3rd of August 1869 to the Rifle Brigade. He became captain in 1871, and, transferred to the 7th Hussars in 1874, was promoted major in 1875, and returned to the Rifle Brigade as lieutenant-colonel in September 1876. He was promoted colonel and major-general in 1880, lieutenant-general in 1889, and general in 1893. He accompanied the expeditionary force to Egypt in 1882, and commanded the Guards brigade at the battle of Tel-el-Kebir. He was mentioned three times in despatches, received the C.B.
and was thanked by parliament. In 1886 the duke went to India and commanded the Bombay army until 1890, when he returned home. He commanded the southern district from 1890 to 1893, and that of Aldershot from 1893 to 1896. On the departure of Lord Roberts for South Africa the duke succeeded him as Commander-in-Chief of the forces in Ireland, 9th of January 1890. On attaining his majority in 1871 an annuity of £15,000 was granted to Prince Arthur by parliament, and in 1874 he was created Duke of Connaught and Strathearn and Earl of Sussex. On the 13th of March 1879 he married Princess Louise Marguerite of Prussia, third daughter of Prince Frederick Charles, and received an additional annuity of £10,000. The duke and duchess represented Queen Victoria at the coronation of the tsar Nicholas II. of Moscow in 1896. On the reorganization of the war office and the higher commands in 1904, the duke was appointed to the new office of inspector-general to the forces, from which he retired in 1907, being then given the new post of commander-in-chief in the Mediterranean stationed at Malta, which he held until 1909.

CONNAUGHT, a province of Ireland occupying the north-western portion of the island, and having as the greater part of its eastern boundary the river Shannon, over its middle course. It includes the counties Mayo, Sligo, Leitrim, Galway and Roscommon (qq. v. for topography, &c.). According to the legendary chronicles of Ireland (Connacht) was given by the Annals of the Four Masters to the King of Connacht, and the Book of Leitrim gives Tíme mac Con Catha (20 B.C.) as the first of the list of the kings of all Connacht, whose realm at its greatest extent included also the district of Brefny or Brefny, corresponding to the modern county of Cavan. The Connacht dynasty held its own till the 4th century A.D., when it was ousted by the Milesian Muireadhach Tírech, king paramount (airdrigh) of Ireland from 320 to 357. Henceforth the annals of Connacht are of little interest until the end of the 12th century, when William de Burgh received a grant of lands in Connacht from King John as lord paramount of Ireland. In the quarrel between Cathal Carrach and Cathal Crovderg for the throne he supported either side in turn, with the result that he lost his Connacht estates in 1203. In 1207, however, his son Richard received a grant from King Henry III. of the forfeited lands of the king of Connacht, and thenceforth the history of the province is closely bound up with that of the great family of Burgh (q. v.). In 1461 Connacht, with Ulster, fell nominally to the crown, in the person of Edward IV., as heir of Lionel, duke of Clarence, and his wife, daughter and heiress of William de Burgh (Connacht) (d. 1353). In the wild districts of the west of Ireland, however, legal controls were easier to claim than to enforce, and from 1433 onward Connacht was in fact divided between the de Burghs, Bourkes or Burkes (MacWilliam "Oughter" and MacWilliam "Eighers"), assimilated now to the Irish in dress and manners, and the native kings of the ancient Milesian dynasty, which survived till 1464. It was not till the 16th century that Connaught began to be effectively brought under English rule. A stage in this direction was marked by the conversion in 1543 of the MacWilliam Eighter, Ulick Bourke, into a noble on the English model as earl of Clanricarde; though it was not till 1603 that the MacWilliam Oughter became Viscount Mayo. Meanwhile, about 1380, Connaught was for the most part divided into shires by Sir Henry Sidney, who also brought into existence the administration of Connaught and Munster by presidents, which continued for seventy years. The county Clare (hitherto Thomond or North Munster) was now annexed to Connaught, and continued to belong to it down to the Restoration.

CONNEAUT, a city of Ashtabula county, Ohio, U.S.A., on Lake Erie, mouth of Conneaut Creek, and about 68 m. N.E. of Cleveland. Pop. (1890) 3241; (1900) 7213 (1227 foreign-born); (1910) 8310. It is served by the New York, Chicago & St Louis (which has railway repair shops here), the Lake Shore & Michigan Southern, and the Bessemer & Lake Erie railways, and by car ferries which ply between Conneaut and Sandusky and Port Stanley on the Canadian side of Lake Erie. There is also a public beach of 20 acres on the lake shore. Conneaut is situated in a grain-growing and dairying region; it has an excellent harbour to and from which coal and ore are shipped, and is a sub-port of entry. The city has planing mills, flour mills, brick works, tanneries, canneries and manufactories of electrical and gas fixtures, electric lamps and tungsten gas lamps. The municipality owns and operates its electric-lighting plant. In 1796 surveyors for the Connecticut Land Co. built a log storehouse here, but the permanent settlement dates from 1798; in 1832 Conneaut was incorporated, and it became a city in 1898.

CONNOUGHT, one of the thirteen original states of the United States of America, and one of the New England group of states. It is bounded N. by Massachusetts, E. by Rhode Island, S. by Long Island Sound, and W. by New York; the S.W. corner projects along the Sound S. of New York for about 13 m. Situated between 40° 54' and 42° 3' N. lat., and 71° 47' and 73° 43' W. long., its total area is 4065 sq. m., of which 145 are water surface: only two states of the Union, Rhode Island and Delaware, are smaller in area.

Physiography.—Connecticut lies in the S. portion of the peninsular region of New England. Its surface is in general that of a gently undulating upland divided near the middle by the lowland of the Connecticut valley, the most striking physiographic feature of the state. The upland rises from the low S. level, with an average of 100 ft., to 300 ft., and is truncated by a few valleys. The upland has a mean elevation along the N. border of the state of 1000 ft. or more, and a few points in the N.W. rise to a height of about 2000 ft. above the sea. The lowland dips under the waters of Long Island Sound at the S. and rises slowly to a height of only 100 ft. above them where it crosses the N. border. At the N. this lowland is about 15 m. wide; at the S. it narrows to only 5 m. and its total area is about 600 sq. m. Its formation was caused by the removal of a band of weak rocks by erosion after the general upland surface had been first formed near sea-level and then elevated and tilted gently S. or E.; in this band of weak rocks were several sheets of hard igneous rock (trach) inclined from the horizontal several degrees, and so resistant that they were not removed but remained to form the "trap ridges" such as West Rock Ridge near New Haven and the Hanging Hills of Meriden. These are identical in origin and structure with Mt. Tom Range and Holyoke Range of Massachusetts, being the S. continuation of those structures. The ridges are generally deeply notched, but their highest points rise to the upland heights, directly to the E. or W. The W. section of the upland is more broken than the E. section, for in the E. the valley was trouted out in the S. continuation of the Green and the Housatonic mountain ranges of Vermont and Massachusetts, the highest among them being: Bear Mountain (Salisbury) 2355 ft.; Gridley Mountain (Salisbury), 2200 ft.; Mt. Riga (Salisbury), 2000 ft.; Mt. Ball (Norfolk) and Lion's Head (Salisbury), each 1760 ft.; Canaan Mountain (North Canaan), 1680 ft.; and Ivy Mountain (Goshen), 1640 ft. Just as the surface of the lowland is broken by the notched trap-ridges, so that of the upland is often interrupted by rather narrow deep valleys, or gorges, extending usually from N. to S. or to the S.E. The lowland is drained by the Connecticut river as far S. as Middletown, but here this river turns to the S.E. into one of the narrow valleys in the E. section of the upland, the turn being due to the fact that the river acquired its present course when the land was at a lower level and before the lowland on the soft rocks was excavated. The principal rivers in the W. section of the upland are the Housatonic and its affluent, the Naugatuck; in the E. section is the Thames which is really an outlet for three other rivers (the Yantic, the Shetucket and the Quinebaug). In the west central and N. regions of the state the course of the rivers is rapid, owing to a relatively recent tilting of the surface. The Connecticut river is navigable as far as Hartford, and the Thames as far as Norwich. The Housatonic river, which in its picturesque course traverses the whole breadth of the state, has a short stretch of tide-water navigation. The lakes which are found in all parts of the state and the rapids and waterfalls along the rivers are largely due to disturbances of the drainage lines by the ice invasion of the glacial period.
To the glacial action is also due the extensive removal of the original soil from the uplands, and the accumulation of morainic hills in many localities. The sea-coast, about 100 m. in length, has a number of bays which have been created by a depression of small valleys making several good harbours.

The climate of Connecticut, though temperate, is subject to sudden changes, yet the extremes of cold and heat are less than in the other New England states. The mean annual temperature is 49° F., the average temperature of winter being 27°, and that of summer 72°. Since the general direction of the winter winds is from the N.W. the extreme of cold (−10° or −15°) is felt in the north-western part of the state, while the prevailing summer winds, which are from the S.W., temper the heat of summer in the coast region, the extreme heat (100°) being found in the central part of the state. The annual rainfall varies from 45 to 50 in.

Agriculture.—Connecticut is not an agricultural state. Although three-fourths of the land surface is included in farms, only 7% of this three-fourths is cultivated; but agriculture is of considerable economic and historic interest. The accounts of the fertility of the Connecticut valley were among the causes leading to the English colonization, and until the middle of the nineteenth century agriculture was the principal occupation. The soils, which are essentially of alluvial loams with the sub-soils of clay are found, were not suitable for tillage. However, a thrifty, industrious, self-reliant agricultural life developed, labour was native-born, the women of the household worked in the fields with the men, some employment was found for every season, and a system of neighbourly barter of food products took the place of other modes of exchange. But the development of manufactures in the first half of the 19th century, the competition of the new western states in farm products, and the change in the character of the population incident to the growth of cities, caused a great change in agriculture after 1860. Indeed, during every decade from 1860 to 1890 the total value of farm property and products declined; and the increase of products from 1890 to 1900 was due to the growth of dairy farms, which yielded almost one-third of the total farm product of the state.

In the same decade Indian corn, potatoes and tobacco were the only staples whose acreage increased and the production of all cereals except Indian corn and buckwheat declined. Tobacco, which was first grown here between 1650 and 1660, because of the law which forbade the sale of tobacco to that grown in the colonies, was in the decade 1890–1900 the only crop raised for consumption outside the state; its average yield per acre (167 lb) was exceeded in the continental United States only in Vermont (1834 lb) and Massachusetts (1674 lb) in 1899, and in 1897 (1510 lb) by New Hampshire (1695 lb), Vermont (1625 lb) and Massachusetts (1525 lb). The total value of Connecticut tobacco in 1907 was $3,501,000 (1906, $4,415,922; 1905, $3,911,933), and the average farm price was 11.5 cents per lb (1906, 18 cents; 1905, 17 cents). But the cultivation of tobacco is confined almost exclusively to the valleys of the Connecticut and Housatonic rivers, and these lands are constantly and expensively treated with nitrogenous fertilizers; the grades raised are the broad-leaf and the Habana seed-leaf wrappers, which, excepting the Florida growth from Sumatra seed, are the nearest domestic approach to the imported Sumatra. The manufacture of cigars was begun in South Windsor, Connecticut, in 1803. Dairying was responsible for the increased production between 1889 and 1899 of Indian corn and the large acreage in hay, which surpassed that in any other crop, but many hay and grain farms were afterwards abandoned. The production of orchard fruits and market vegetables, however, increased during the decade 1890–1900.

Other evidences of the transition in agricultural life are that in Tolland and Windham counties the value of farm buildings exceeded that of farm land, that in Middlesex and Fairfield counties the acreage as well as the value of the farms declined, that native farm labour and ownership were being replaced by foreign labour and ownership; while dependent land tenure is insignificant, 87% of the farms being worked by their owners. The state board of agriculture holds annual conventions for the discussion of agricultural problems.

Minerals.—The mineral industries of Connecticut have had a fortune very similar to that of agriculture. The early settlers soon discovered metals in their soil and began to work them. About 1730 the production of iron became an important industry in the vicinity of Salisbury, and from Connecticut iron many of the American military supplies in the War of Independence were manufactured. Copper was mined in East Granby as early as 1705 and furnished material for early colonial and United States coins. Gold, silver and lead have also been produced, but the discovery of larger deposits of these metals in other states has caused the abandonment of all metal mines in Connecticut, except those of iron and tungsten. The quarries of granite near Long Island Sound, those of sandstone at Portland, and of feldspar at Branchville and South Glastonbury, however, have furnished building and paving materials for other states; the stone product of the state was valued at $5,386,540 in 1906. Limestone, for the reduction of lime, is also mined; and beryl, clays and mineral springs yield products of minor importance.

On account of the importations from Canada, Chesapeake Bay and the Great Lakes, the mackerel, cod and menhaden fisheries declined, especially after 1860, and the oyster and lobster fisheries were worked down. In 1905, according to the U.S. Bureau of Fisheries, the fisheries' products of the state were valued at $3,173,948, market oysters being valued at $1,206,217 and seed oysters at $1,903,615.

Manufactures.—Manufacturing, however, has encountered none of the vicissitudes of other industries. Manufactures form the principal source of Connecticut's wealth, manufacturing gave occupation in 1900 to about one-fifth of the total population, and the products in that year ranked the state eleventh among the states of the American Union. Indeed, manufacturing in Connecticut is notable for its early beginning and its development of certain branches beyond that of the other states. Iron products were manufactured throughout the 18th century, nails were made before 1776 and were exported from the colony, and it was in Connecticut that cannon were cast for the Continental troops and the chains were made to block the channel of the Hudson river to British ships. Tinware was manufactured in Berlin, Hartford county, as early as 1770, and tin, steel and iron goods were peddled around the colonies. The Connecticut clock maker and clock shop was a typical embodiment of Yankee ingenuity; the most famous of the next generation of clock makers were Eli Terry (1772–1852), who made a great success of his wooden clocks; Chauncey Jerome, who first used brass wheels in 1837 and founded in 1844 the works of the New Haven Clock Co.; Gideon Roberts; and Terry's pupil and successor, Seth Thomas (1786–1859), who built the factory at Thomaston carried on by his son Seth Thomas (1816–1888). In 1732 the London hatters complained of the competition of Connecticut hats in their trade. Before 1749 brass works were in operation at Waterbury—the great brass manufacturing business there growing out of the making of metal buttons. In 1768 paper mills were erected at Norwich, and in 1776 at East Hartford. In 1778 the first woolen mills in New England were established at Hartford, and about 1803 one hundred merino sheep were imported by David Humphreys, who in 1806 built a mill in that part of Derby which is now Seymour and which was practically the first New England factory town. In 1812 steam was first used by the Middletown Woolen Manufacturing Company. In 1825 the manufacture of cotton was begun at Vernon, Hartford county; in 1826 the textile industries of the town of Middletown, and the manufacturing industry of the city of New London, had been established. The period of greatest development of manufactures began after the war of 1812. The decade of greatest relative development was that of 1860-1870, during which the value of the products increased 66-68%. During the period 1850-1900, when the population increased 145%, the average number of wage-earners
employed in manufacturing establishments increased 248.3%, the number so employed constituting 13.7% of the state's total population in 1850 and 10.5% of that in 1900. The average number of wage-earners employed in establishments conducted under the factory system alone was 13.7% greater in 1905 than in 1900. In 1900 Connecticut led the United States in the manufacture of ammunition, bells, brass and copper (rolled), brass castings and finishings, brass ware and needles and pins. In the automobile industry the state in 1905 ranked second (to Michigan) in capital invested; and was sixth in value of product, but first in the average value per car, which was $2354 ($2917 for gasoline; $2343 for electric; $673 for steam cars). Connecticut has long ranked high in textile manufactures, but the product of cotton goods in 1900 ($15,494,760), this being due to the increase in cotton manufacturing in the South. Between 1890 and 1900 Connecticut's products in dyeing and finishing of textiles, industries which have as yet not developed in the South, increased 217.3% from $715,388 in 1890 to $2,269,676 in 1900; in 1905 their value was $4,215,314. The manufacture of woolen goods and silk also increased respectively 33% and 26.5% between 1890 and 1900; the returns being however in the fur hat product ($7,548,882), which was not included in the former returns. In 1905 the value of the woolen goods manufactured in the state was $11,166,656, of the silk goods, $15,623,601. The value of the products of all the textile industries combined increased from $46,819,399 in 1900 to $56,033,113 in 1905, when the combined textile product value was greater than that of any other manufactured product in the state. The most important single industry in 1905 was the manufacture of rolled brass and copper with a product value of $41,911,093 in 1900 ($36,325,178) — 8.7% of the total for the United States; the value of the product of the other brass industries was brass ware ($9,022,427), — 21.5% of the total for the United States, — ($10,947,451); and brass castings and brass finishings ($2,682,115, 1900) $3,254,739. Hardware ranks next in importance, the output of 1905 being valued at $21,480,652, which was 46.9% of the total product value of hardware for the entire United States; as against — $16,301,198 in 1900. Then come in rank of product value for 1905: foundry and machine shops ($20,185,384, 1900) $18,991,079; cotton goods, $14,000,000; silk goods; ammunition ($15,394,485); being 72.2% of the total value of all ammunition made in the United States, — ($6,923,172); and handles, pews and boots and shoes ($12,826,346, 1900) $11,090,028. In 1905 the state ranked first in the United States in the value of clocks manufactured, — $6,158,034, or 69.4% of the total product value of the industry for that year in the United States, and also in the value of plated ware — $8,123,881, being 66.9% of the product value of the United States. The decade of greatest absolute increase in the value of manufactures was that ending in 1900, the value of manufactured products in that year being $352,284,116, an increase of $114,457,742 over that of 1890. The general tendency was towards the centralization of industry, the number of establishments in the leading industries increasing less than 5% while the capital and the value of the products increased respectively 33.5% and 42%. Among the new manufacturies were a ship-building establishment at Groton near New London, which undertook contracts for the United States government, and a compressed air plant near Norwich. Of the 359 manufactured products classified, the United States census, 249, or almost seven-tenths, were produced in New Hampshire. This prominence in manufactures is due to excellent transportation facilities, to good water powers, to the ease with which labour is got from large cities, to plentiful capital (furnished by the large

1 The figure given above as the gross value of all manufactured products in 1900 includes that of all manufacturing and mechanical establishments. The value of the products of factories alone was $315,106,150. By 1905 this had increased to $399,089,921 or 17.1%.
of the justices of the peace, and validated contracts against which judgment by default had been secured. Qualifications for suffrage are: the age of twenty-one years, citizenship in the United States, residence in the state for one year and in the township for six months preceding the election, a good moral character, and ability "to read in the English language any article of the Constitution or any section of the Statutes of this State." Women may vote for school officials. The right to decide upon a citizen's qualifications for suffrage is vested in the selectmen and clerk of each township. A property qualification, found in the original constitution, was removed in 1845. The Fifteenth Amendment of the Federal Constitution was ratified (1869) by Connecticut, but negroes were excluded from the suffrage by the state constitution until 1876.

The jurisprudence of Connecticut, since the 17th century, has been notable for its divergence from the common law of England. In 1639 inheritance by primogeniture was abolished, and this resulted in conflict with the British courts in the 18th century. At an early date, also, the office of public prosecutor was created to conduct prosecutions, which until then had been left to the aggrieved party. The right of bastards to inherit the mother's property is recognized, and the age of consent has been placed at sixteen years. Neither husband nor wife may alienate, by express or implied contract, their real estate or their earnings, and the earnings of the wife are her sole property and she has the right to make contracts as if unmarried. After residence in the state for three years divorce may be obtained on grounds of fraudulent contract, desertion, neglect for three years, adultery, cruelty, intemperance, imprisonment for life and certain crimes. The Joint Stock Act of 1837 furnished the precedent and the principle for similar legislation in other American states (and it is said) for the English Joint Stock Companies Act of 1856. The relations between capital and labour are the subject of a series of statutes, which prohibit the employment of children under fourteen years of age in any mechanical, mercantile or manufacturing establishment, punish with fine or imprisonment any attempt by an employer to influence his employee's vote or to prevent him from joining a labour union, and in cases of insolvency give preference over general liabilities to debts of $100 or less for labour. A homestead entered upon record and occupied by the owner is exempt to the extent of $1000 in value from liability for debts.

The government of Connecticut is also notable for the variety of its administrative boards. Among these are a board of pardons and a state library committee, a board of mediation and arbitration for adjustment of labour disputes, a board of education and a railway commission. The bureau of labour statistics has among its duties the giving of information to immigrant labourers regarding their legal rights: it has free employment agencies at Bridgeport, Norwich, Hartford, New Haven and Waterbury. A state board of charities has supervision over all philanthropic and penal institutions in the state, including hospitals, which numbered 103 in 1907; and the board visits the almshouses supported by seventy-eight (of the 168) towns of the state, and investigates and supervises the provision made for the town poor in the other ninety towns of the state; some, as late as 1906, were, with the few paupers maintained by the state, cared for in a private almshouse at Tollandville, which was commonly known as the "state almshouse." The institutions supported by the state are: a state prison at Wethersfield, the Connecticut industrial school for girls (reformatory) at Middletown and a similar institution for boys at Meriden, the Connecticut hospital for the insane at Middletown, the state hospital for the deaf at New Britain, the city of New Haven, and the townships for the insane at Waterbury, New Haven, and Bridgeport. The state almost entirely supports the Connecticut school for imbeciles, at Lakeville; the American school for the deaf, in Hartford; the oral school for the deaf, at Mystic; the Connecticut institute and industrial home for the blind, at Hartford; Fitch's home for soldiers, at Noroton; ten county jails in the eight counties; and eight county temporary homes for dependent and neglected children.

Education.—Education has always been a matter of public interest in Connecticut. Soon after the foundation of the colonies Connecticut and New Haven, schools similar to the English Latin schools were established. The Connecticut Code of 1650 required all parents to educate their children, and every township of 50 householders (later 30) to have a teacher supported by the men of family, while the New Haven Code of 1656 also encouraged education. In 1672 the general court granted 600 acres of land to each county for educational purposes; in 1794 the general assembly appropriated the proceeds from the sale of western lands to education, and in 1837 made a similar disposition of funds received from the federal treasury. The existing organization and methods in school work began in 1838, when the state board of commissioners of common schools (later replaced by a board of education) was organized, with Henry Barnard at its head. In 1865, 5.9% of the population at least 10 years of age was illiterate. All children between 7 and 16 are required to attend school, but those over 14 are excused if they labour; every township of more than 10,000 inhabitants must have one school. Text-books are provided by the townships for those unable to purchase them. In 1907-1908 the total school revenue was $5,027,877, or $22.35 for each child enrolled, the enrolment being 78.5% of the total number of children enumerated of school age. Of the school revenue about 2.81% was derived from a permanent school fund, 10.96% from state taxation, 30.43% from local taxation and 5.8% from other sources. The average school term was 186-73 days (in 1899-1900 it was 189-01 days), and the average monthly salary of male teachers $115.07, of female teachers, $50.5. Supplementing the educational influence of the schools are the public libraries (161 in number in 1907); the state appropriates $200 to establish, and $100 per annum to maintain, a public library (provided the town in which the library is to be established contributes an equal amount), and the Public Library Committee has for its duty the study of library problems. Higher education is provided by Yale University (Q.E.), by Trinity College, at Hartford (non-sectarian), founded in 1823; by Wesleyan University, at Middletown, the oldest college of equal standing in the United States, founded in 1831; by the Hartford Theological Seminary (1831); by the Connecticut Agricultural College, at Storrs (founded 1881), which has a two years' course of preparation for rural teachers and has an experiment station; by the Connecticut Experiment Station at New Haven, which was established in 1875 at Middletown and was the first in the United States; and by normal schools at New Britain (established 1881), Willimantic (1890), New Haven (1894) and Danbury (1903).

Finance.—In the year ending on the 30th of September 1908 the receipts of the state treasury were $3,925,492, the expenditure $4,741,549, and the funded debt, deducting a Civil List Fund of $325,513 in the treasury, was $548,586. The debt was increased in April 1909 by the issue of bonds for $1,000,000 (out of $7,000,000 authorized in 1907). The principal source of revenue was an indirect tax on corporations, the tax on railways, savings banks and life insurance companies, yielding 10.7% of the state's income. A tax on inheritances ranked next. There is a military commutation tax of $2, and all persons neglecting to pay it or to pay the poll tax are liable to imprisonment. A state board of equalization has been established to prevent equitable taxation. More than 130 underwriting institutions have been chartered in the state since 1794. The insurance business centres at Hartford. The legal rate of interest is 6%, and days of grace are not allowed.

History.—The first settlement by Europeans in Connecticut was made on the site of the present Hartford in 1633, by a party of Dutch from New Netherland. In the same year a trading post was established on the Connecticut river, near Windsor, by members of the Plymouth Colony, and John Oldham...
Encouraged matters ordering burgesses principally two with the those Branford, Guilford 1630; the for the Connecticut valley. The emigrants from Watertown founded Wethersfield in the winter of 1634–1635; those from New Town (now Cambridge) settled at Windsor in the summer of 1635; and in the autumn of the same year people from Dorchester settled at Hartford. These early colonists had come to Massachusetts in the Puritan migration of 1630; their removal to Connecticut, in which they were led principally by Thomas Hooker (q.v.), Roger Ludlow (c. 1590–1665) and John Haynes (d. 1642), was caused by their discontent with the autocratic character of the government in Massachusetts; but the instrument of government which they framed in 1639, known as the Fundamental Orders of Connecticut, reveals no radical departure from the institutions of Massachusetts. The general court—the supreme civil authority—was composed of deputies from the towns, and a governor and magistrates who were chosen at a session of the court attended by all freemen of the towns. It powers were not clearly defined; there was also no separation of the executive, legislative and judicial functions, and the authority of the governor was limited to that of a presiding officer.

The government thus established was not the product of a federation of townships, as has often been stated; indeed, the townships had been governed during the first year by commissioners deriving authority from Massachusetts, and the first general court was probably convened by them. In 1638 the celebrated Fundamental Orders were drawn up, and in 1639 they were adopted. Their most original feature was the omission of a religious test for citizenship, though a precedent for this is to be found in the Plymouth Colony; on the other hand, the union of church and state was presumed in the preamble, and in 1639 a property qualification (the possession of an estate of £50) for suffrage was imposed by the general court.

In the meantime another migration to the Connecticut country had begun in 1638, when a party of Puritans who had arrived in Massachusetts the preceding year sailed from Boston for the Connecticut coast and there founded New Haven. The leaders in this movement were John Davenport (1597–1670) and Theophilus Eaton, and their followers were drawn from the English middle class. Soon after their arrival these colonists drew up a "plantation covenant" which made the Scriptures the supreme guide in civil as well as religious affairs; but no copy of this is now extant. In June 1639, however, more definite statements of political principles was framed, in which it was clearly stated that the rules of Scripture should determine the ordering of the church, the choice of magistrates, the making and repeal of laws, the dividing of inheritances, and all other matters of public import; that only church members could become free burgesses and officials of the colony; that the free burgesses should choose twelve men who should choose seven others, and that these should organize the church and the civil government. In 1643 the jurisdiction of the New Haven colony was extended by the admission of the townships of Milford, Guilford and Stamford to equal rights with New Haven, the recognition of their local governments, and the formation of two courts for the whole jurisdiction, a court of magistrates to try important cases and hear appeals from "plantation" courts, and a general court with legislative powers, the highest court of appeals, which was similar in composition to the general court of the Connecticut Colony. Two other townships were afterwards added to the colony, Southold, on Long Island, and Branford, Conn.

The religious test for citizenship was continued (except in the case of the citizens of Milford), and in 1644 the general court decided that the "judicial laws of God as they were declared by Moses" should constitute a rule for all courts "till they be branched out into particulars hereafter." The theocratic character of the government thus established is clearly revealed in the series of strict enactments and decisions which constituted the famous "Blue Laws." Of the laws (45 in number) given by Peters, more than one-half really existed in New Haven, and more than four-fifths existed in some form in the New England colonies. Among those of New Haven are the prohibition of trial by jury, the infliction of the death penalty for adultery, and of the same penalty for conspiracy against the jurisdiction, the strict observance of the Sabbath enjoined, and heavy fines for "concealing or entertaining Quaker or other blasphemous heretics."

A third Puritan settlement was established in 1635 at the mouth of the Connecticut river, under the auspices of an English company whose leading members were William Fiennes, Lord Say and Seale (1582–1662) and Robert Greville, Lord Brooke (1608–1643). In their honour the colony was named Saybrook. In 1639 George Fenwick (d. 1657), a member of the company, arrived, and immigration from England soon afterwards greatly declined on account of the Puritan Revolution, he sold the colony to Connecticut in 1644. This early experiment in colonization at Saybrook and the sale by Fenwick are important on account of their relation to a fictitious land title. The Say and Seale Company secured in 1631 from Robert Rich, earl of Warwick (1587–1638), a quit claim to his interest in the territory lying between the Narragansett river and the Pacific Ocean. The claim to Warwick's right to the land is not stated in any extant document, and no title of his to it ever shown. But the Connecticut authorities in their effort to establish a legal claim to the country and to thwart the efforts of the Hamilton family to assert its claims to the territory between the Connecticut river and Narragansett Bay—claims derived from a grant of the Plymouth Company to James, marquess of Hamilton (1666–1649)—in 1635—elaborated the theory that the Plymouth Company had made a grant to Warwick, and that consequently his quit claim conferred jurisdiction upon the Say and Seale Company; but even in this event, Fenwick had no right to make his sale, for which he never secured confirmation.

The next step in the formation of modern Connecticut was the union of the New Haven colony with the older colony. This was accomplished by the royal charter of 1662, which defined the boundaries of Connecticut as extending from Massachusetts south to the sea, and from Narragansett bay west to the South Sea (Pacific Ocean). This charter had been secured without the knowledge or consent of the New Haven colonists and they naturally protested against the union with Connecticut. But on account of the threatened absorption of a part of the Connecticut territory by the Colony of New York granted to the duke of York in 1664, and the news that a commission had been appointed in England to settle intercolonial disputes, they finally assented to the union in 1665. Hartford then became the capital of the united colonies, but shared that honour with New Haven from 1701 until 1873.

The charter was liberal in its provisions. It created a corporation under the name of the Governor and Company of the English Colony of Connecticut in New England in America, sanctioned the system of government already existing, provided that all acts of the general court should be valid upon being issued under the seal of the colony, and made no reservation of royal or parliamentary control over legislation or the administration of justice. Consequently there developed in Connecticut an independent, self-reliant colonial government, which looked to its chartered privileges as the supreme source of authority.

Although the religious and governmental influences which moulded Connecticut were similar to those which moulded New England at large, the colony developed certain distinctive characteristics. Its policy was to avoid notoriety and public attitudes; to secure privileges without attracting needless

1 A collection of these laws was published in his General History of Connecticut (London, 1781), by the Rev. Samuel Peters (1735–1826), a Loyalist clergyman of the Church of England, who in 1774 was forced by the patriots or whigs to flee from Connecticut. The most extreme and (most quoted) of these laws were never in force in Connecticut, but the substantial genuineness of others was conclusively shown by Walter F. Prince, in The Report of the American Historical Association for 1898.
Connecticut

notice; to act as intensely and vigorously as possible when action seemed necessary and promising; but to say as little as possible, and evade as much as possible when open resistance was evident folly."

The relations of Connecticut with neighbouring colonies were notable for numerous and continuous quarrels in the 17th century. Soon after the first settlements were made, a dispute arose with Massachusetts regarding the boundary between the two colonies; after the brief war with the Pequot Indians in 1637 a similar quarrel followed regarding Connecticut's right to the Pequot lands, and in the New England Confederation (established in 1643) friction between Massachusetts and Connecticut continued. Difficulty with Rhode Island was caused by the conflict between that colony's charter and the Connecticut charter regarding the western boundary of Rhode Island; and the encroachment of outlying Connecticut settlements on Dutch territory, and the attempt to extend the boundaries of New York to the Connecticut river, gave rise to other disputes. These questions of boundary were a source of continuous discord, the last of them not being settled until 1881. The attempts of Governors Joseph Dudley (1647-1720), of Massachusetts, and Thomas Dongan (1634-1715) of New York, to unite Connecticut with their own colonies also failed difficulty.

The relations of Connecticut and New Haven with the mother country were similar to those of the other New England colonies. The period of most serious friction was that during the administration of the New England colonies by Sir Edmund Andros (q.v.), who in pursuance of the later Stuart policy both in England and in her American colonies visited Hartford on the 31st of October 1687 to execute quo warranto proceedings against the charter of 1662. It is said that during a discussion at night over the surrender of the charter the candles were extinguished, and the document itself (which had been brought to the meeting) was removed from the table where it had been placed. According to tradition it was hidden in a large oak tree, afterwards known as the "Charter Oak." But though Andros thus failed to secure the charter, he dissolved the existing government. After the Revolution of 1688, however, government under the charter was resumed, and the crown lawyers decided that the charter had not been invalidated by the quo warranto proceedings.

Religious affairs formed one of the most important problems in the life of the colony. The established ecclesiastical system was the Congregational. The Code of 1630 (Connecticut) taxed all persons for its support, provided for the collection of church taxes, if necessary, by civil distraint, and forbade the formation of new churches without the consent of the general court. The New England Half Way Covenant of 1657, which extended church membership so as to include all baptized persons, was sanctioned by the general court in 1664. The custom by which neighbouring churches sought mutual aid and advice, prepared the way for the Presbyterian system of church government, which was established by an ecclesiastical assembly held at Saybrook in 1708, the church constitution there framed being known as the "Saybrook Platform." At that time, however, a liberal policy towards dissent was adopted, the general court granting permission for churches "soberly to differ or dissent" from the establishment. Hence a large number of new churches soon sprang into being. In 1727 the Church of England was permitted to organize in the colony, and in 1729 a similar privilege was granted to the Baptists and Quakers. A religious revival swept the colony in 1741. The very existence of the establishment seemed threatened; consequently in 1742 the general court forbade any ordained minister to enter another parish than his own without an invitation, and decided that only those were legal ministers who were recognized as such by the general court. Throughout the remaining years of the 18th century there was constant friction between the establishment and the nonconforming churches; but in 1791 the right of free incorporation was granted to all sects.

In the War of American Independence Connecticut took a prominent part. During the controversy over the Stamp Act the general court instructed the colony's agent in London to insist on "the exclusive right of the colonists to tax themselves, and on the privilege of trial by jury," as rights that could not be surrendered. The patriot sentiment was so strong that Loyalists from other colonies were sent to Connecticut, where it was believed they would have no influence; and the copper mines at Simsbury were converted into a military prison; but among the nonconforming sects, on the other hand, there was considerable sympathy for the British cause. Preparations for war were made in 1774; on the 28th of April 1775 the expedition against Ticonderoga and Crown Point was resolved upon by some of the leading members of the Connecticut assembly, and although they had obtained in their private capacity funds were obtained from the colonial treasury to raise the force which on the 8th of May was put under the command of Ethan Allen. Connecticut Volunteers were among the first to go to Boston after the battle of Lexington and more than one-half of Washington's army at New York in 1776 was composed of Connecticut soldiers. Yet with the exception of isolated British movements against Stonington in 1775, Danbury in 1777, New Haven in 1779 and New London in 1781 no battles were fought in Connecticut territory.

In 1776 the government of Connecticut was reorganized as a state, the charter of 1662 being adopted by the general court as "the Civil Constitution of this State, under the sole authority of the people thereof, independent of any King or Prince whatever." In the formation of the general government the policy of the state was national. It acquiesced in the loss of western lands through a decision (1788) of a court appointed by the Confederation (see Wyoming Valley); favoured the levy of taxes on imports by federal authority; relinquished (1786) its claims to all western lands, except the Western Reserve (see Ohio); and, in the constitutional convention of 1787 the present system of governmental representation in Congress was proposed by the Connecticut delegates as a compromise between the plans presented by Virginia and New Jersey.

For many years the Federalist party controlled the affairs of the state. The opposition to the growth of American nationality which characterized the later years of that party found expression in a resolution of the general assembly that a bill for incorporating state troops in the Federal army would be "utterly subversive of the rights and liberties of the people of the state, and the freedom, sovereignty and independence of the same," and in the prominent part taken by Connecticut in the Hartford Convention (see Hartford) and in the advocacy of the radical amendments proposed by it. But the development of manufactures, the discontent of nonconforming religious sects with the establishment, and the confusion of the executive, legislative and judicial branches of the government in the existing constitution opened the way for a political revolution. All the discontented elements, especially the Democratic party in 1817, which had defeated the Federalists in the state election, and in 1818 the existing constitution was adopted. From 1830 until 1855 there was close rivalry between the Democratic and Whig parties for control of the state administration.

In the Civil War Connecticut was one of the most ardent supporters of the Union cause. When President Lincoln issued his first call, for 75,000 volunteers, there was not a single militia company in the state ready for service. Governor William A. Buckingham (1804-1875), one of the ablest and most zealous of the "war-governors," and afterwards, from 1865 until his death, a member of the United States Senate, issued a call for volunteers in April 1861; and soon 54 companies, more than five times the state's quota, were organized. Corporations, individuals and towns made liberal contributions of money. The general assembly made an appropriation of $2,000,000, and the state furnished approximately 48,000 men to the army.

2 For a good version of the tradition see Wadsworth or the Charter Oak (Hartford, 1904), by W. H. Gocher. The tree was blown down in August 1856; in June 1907 a marble shaft was unveiled on its site by the Society of Colonial Wars, of Connecticut.
Equally important was the moral support given to the Federal government by the people. After the war the Republicans were more frequently successful at the polls than the Democrats. Representation in the lower house of the general assembly, by the constitution of 1818, was based on the townships, each township having two representatives, except townships created after 1818, which had only one each; this method constituted a serious evil when, in the transition from agriculture to manufacturing as the leading industry, the population became concentrated to a considerable degree in a few large cities, and the relative importance of the various townships was greatly changed. The township of Marlborough, with a population in 1900 of 323, then had one representative, while the city of Hartford, with a population of 79,850, had only two; and the township of Union, with 428 inhabitants, and the city of New Haven, with 108,027, each had two representatives. The apportionment of representation in the state senate had become almost as objectionable. By a constitutional amendment of 1828 it had been provided that senators should be chosen by districts, and that in the apportionment regard should be had to population, no county or township to be divided and no part of one county to be joined to the whole or part of another county, and each county to have at least two senators; but by 1900 any relation to the districts might once have had to population had disappeared. The system of representation had sometimes put in power a political party representing a majority of the voters: in 1878, 1884, 1886, 1888 and 1890 the Democratic candidates for state executive offices received a plurality vote; but, as a majority was not obtained, these elections were referred to the general assembly, and the Republican party in control of the lower house secured the election of its candidates; in 1901 constitutional amendments were adopted making a plurality vote sufficient for election, increasing the number of senatorial districts, and stipulating that "in forming them regard shall be had to population. But the greater inequalities in township representation subsisted, although in 1874 an amendment had given all townships of 5000 inhabitants two seats in the lower house, every other one "to be entitled to its present representation," and in 1876 another amendment had provided that no township incorporated thereafter should be entitled to a representative "unless it has at least 2500 inhabitants, and unless the town from which the major portion of its territory is taken has also at least 2500 inhabitants." These provisions did not remedy the general defects, and as proposals for an amendment of the constitution could not be submitted to the people only after receiving a majority vote of the lower house, all further attempts at effective reform seemed to be blocked, owing to the unwillingness of the representatives of the smaller townships to surrender their unusual degree of power. Therefore, the question of calling a constitutional convention, for which the present constitution makes no provision, was submitted to the people in 1901, and was carried. But the act providing for the convention had stipulated that the delegates thereto should be chosen on the basis of township representation instead of population. The small townships thus secured practical control of the convention, and no radical changes were made. A compromise amendment submitted by the convention, providing for two representatives for each township of 2000 inhabitants, and one more for each 5000 above 50,000, satisfied neither side, and when submitted to a popular vote, on the 16th of June 1902, was overwhelmingly defeated.

BIBLIOGRAPHY. — The "Acorn Club" has recently published a list of books in Connecticut between 1700 and 1860 (Hartford, 1904), and Alexander Johnston's Connecticut (Boston, 1887) contains a bibliography of Connecticut's history up to 1886. Information concerning the physical features of the state may be obtained in William M. Davis' Physical Geography of Southern New England and National Geographical Society Publications, 1895. For information concerning industries, &c., see the Twelfth Census of the United States, and the Census of Manufactures of 1905, and a chapter in Johnston's Connecticut. For law and administration, consult the last two chapters on Connecticut.
The Constitution and Laws of Connecticut," in New England States (vol. i., Boston, 1897); "Town Rule in Connecticut" in Political Science Quarterly, vol. iv.; Bernard Steiner's History of Education in Connecticut (Washington, 1893), and the reports of the administrative boards and officials, especially the Reports of the Board of Agriculture, the Board of Education, the Board of Charities, and the Treasurer. There is no completely satisfactory history of the state. Connecticut's constitution is well written, but his theories regarding the relationship between the towns and the state are not generally accepted by historical scholars. There is a good chapter in Herbert L. Osgood's History of the American Colonies in the Seventeenth Century (New York, 1904). Connecticut as a Colony and as a State (Hartford, 1904; 4 vols.) is written from secondary sources, as are G. H. Steinberg's History of Connecticut (Hartford, 1857). Perhaps the most satisfactory historical work is That of Benjamin Trumbull, A Complete History of Connecticut from 1630 to 1764 (New Haven, 1804-1818). E. E. Awtrey's History of the Middle States (New York, 1893) (vol. vii. 1894) is the best work on Connecticut. The constitution of Connecticut is published in the monograph of C. H. Levermore, "The Republic of New Haven," and that of C. M. Andrews' "The River Towns of Connecticut" in The Johns Hopkins University Studies (Baltimore, 1887 and 1888) should be consulted for the insular and colonial periods.

CONNECTICUT RIVER, a stream of the New England states, U.S.A. It rises in Connecticut Lake in N. New Hampshire—several branches join in N.E. Vermont, near the Canadian line, about 2000 ft. above the sea—flows S., forming the boundary between Vermont and New Hampshire, crosses Massachusetts and Connecticut, and empties into Long Island Sound. Its course is about 345 m. and its drainage basin 11,065 sq. m. The principal tributary is the Farmington, which rises in the Green Mountains in Massachusetts, and joins the Connecticut above Hartford. From its head to the Massachusetts line the banks are wooded, the bed narrow, the valley slopes cut sharply in crystalline rocks, and the tributaries small and torrential. In the 273 m. of this upper portion of its course the average descent is 15 to 16 ft. mile. In Massachusetts and Connecticut the river, through a basin of weaker Triassic shales and sandstones, and the valley consequently broadens out, making the finest agricultural region of large extent in New England. Near Holyoke and at other points where the river banks are washed by the rivers, hill the valley lowland that they are locally called mountains. From their crests there are beautiful views of the fertile Connecticut valley lowland and of the more distant enclosing hills of crystalline rocks. The river winds over this lowland, for the most part flowing over alluvial bottoms. The valley sides rise from the river channels by a series of steps or terraces. These terraces are noted for their perfection of form, being among the most perfect in the country. They have been cut by the river in its work of removing the heavy deposits of gravel, sand and clay that were laid down in this lowland during the closing stages of the Glacial Period, when great volumes of water, heavily laden with sediment, were poured into this valley from streams issuing from the receding ice front. In the course of this excavation of glacial deposits the river has here and there discovered buried spurs of rock over which the water now tumbles in rapids and falls. For example, 11 m. above Hartford are the Enfield Falls, where the river, 100 ft. wide, in autumn (16 highest water) is made in 5-2 m. At Middletown, Conn., the river leaves the shallow S.E., leaving the belt of Triassic rocks and again entering the area of crystalline rocks which border the lowland. Therefore, from near Middletown to the sea the valley again narrows. The river valley is a great manufacturing region, especially where there is a good water-power derived from the stream, as at Wilder and Bellows Falls, Vt., at Turners Falls and Holyoke, Mass., and at Windsor Locks, Conn. Five miles below Brattleboro, Vt., a huge power dam was under construction in 1909. Efforts have been made by the United States government to open the river to Holyoke, and elaborate surveys were made in 1866-1907. At Enfield Rapids is a privately built canal with locks 80 ft. long and 18 ft. wide, handling boats with a draft of 3 ft. From Hartford seaward the Connecticut is a tidal and navigable stream. Bars form at the mouth and have 39 to 41° 15' 15". From 1829-1899 the Federal government expended $85,000 for the improvement of the river. During the colonial period the Connecticut River played an important part in the settlement of New England. The rival English and Dutch fur traders found it a convenient highway, and English homeseekers were soon attracted to its valley by the fertility of the meadow lands. From the middle of the 17th century until the advent of the railway the stream was a great thoroughfare between the seacoast and the region to the north. Its valley was consequently settled with unusual rapidity, and is now a thickly populated region, with many flourishing towns and cities.

CONNECTICUT TISSUES, in anatomy. Very widely distributed throughout the tissues and organs of the animal body, there occur tissues characterized by the presence of a high proportion of intercellular substance. This intercellular substance may be homogeneous in structure, or, as is more commonly the case, it may consist, in whole or in part, of a number of fibrous elements. All these tissues are grouped together under the name Connective Tissues. They comprise the following types:—

Aerolar tissue, adipose tissue, reticular or lymphoid tissue, white fibrous tissue, elastic tissue, cartilage and bone. They are all developed from the same layer of embryonic cells and all perform a somewhat similar function, viz. to connect and support the other tissues and organs. According to the nature of their work the ground substance varies in its texture, being fibrous in some, calcareous and rigid in others. As forming the most typical of these tissues, we will first consider the structure of aerolar connective tissue.

Aerolar Tissue.—This tissue is found in its most typical form uniting the skin to the deeper lying parts. It varies greatly in its density according to the animal and the position of the body from which it is taken. A piece of the looser variety may be spread out as a thin sheet and then examined microscopically. It is then seen to consist chiefly of bundles of extremely fine fibres running in all directions and interlacing with one another to form a meshwork. The spaces, or aerolea thus formed give the name to this tissue (see fig. 1). The constituent fibres of each bundle are termed White Fibres. The bundles vary very much in size, but the fibres of which they are composed are of wonderfully constant size. A bundle may branch by sending off its fibres to unite with similar branches from neighbouring bundles, but the individual fibres do not branch nor do they at any time fuse with one another. They form bundles of greater or less size by being arranged parallel to one another, and in these bundles are bound together by some kind of cement substance. The meshwork formed by these fibres is filled up by a ground substance in the composition of which mucin takes some part. In this ground substance lie the cells of the tissue. In addition to the white fibres a second variety of fibres is also present in this tissue. They can be readily distinguished from the white fibres by their smaller size, by their more distinct outline, and by the fact that they, for the most part, run as straight lines through the preparation. Moreover they do not branch, and the branches unite with those of neighbouring fibres. They are known as Yellow Elastic Fibres. Several of these will be found torn across in any preparation especially at the edges, and the torn ends will be found to be curled up in a very characteristic manner. The two types of fibre further differ from one another both chemically and physically. Thus the white fibre swells up and dissolves in boiling water, yielding a solution of
gelatin, whereas the yellow elastic fibre is quite insoluble under these conditions. The white fibres swell when treated with weak acetic acid, and are readily dissolved by peptic digestion but not by pancreatic. The yellow elastic fibres, on the other hand, are unaffected by acetic acid and resist the action of gastric juice for a long time, but are dissolved by pancreatic juice. In

physical properties the white fibres are inextensible and extraordinarily strong, even being able, weight for weight, to carry a greater strain than steel wire. The yellow elastic fibres, on the other hand, are easily extensible and very elastic, but are far less strong than the white fibres. Their elasticity is exhibited by their straight course when viewed in a stretched preparation of areolar tissue, and this contrasts markedly with the wavy course of the bundles of white fibres seen in the same preparation.

The Cells of Areolar Tissue.—Several types of cells are found in the spaces of this tissue and are usually classified as follows. (1) Lamellar cells. These are flattened branching cells which usually lie attached to the bundles of white fibres or at the junction of two or more bundles. The branches commonly unite with similar branches of neighbouring cells. (2) Plasma cells. These are composed of a highly vacuolated plasma, are not flattened but otherwise vary greatly in shape. (3) Granular cells. These are spherical cells densely packed with granules which stain deeply with basic dyes. (4) Leucocytes. These are typical blood corpuscles which have left the blood capillaries and gained the tissue spaces. They vary much in amount and in variety.

Adipose or Fatty Tissue.—This consists of rounded vesicles closely packed together to form a dense tissue, found for instance around an organ, along the course of the smaller blood vessels, or in the areolar tissue beneath the skin. This tissue is formed from areolar tissue by an accumulation of fat within certain of the cells of the tissue. These are especially the granular cells, though some regard the fat cells as specific in character, and to be found in large numbers only in certain parts of the body. The fat is either taken in as such by the cell, or, as is more commonly the case, manufactured by the cell from other chemical material (carbohydrate chiefly) and deposited within it in the form of small granules. As these accumulate they run together to form larger granules and this process continuing, the cell at last becomes converted into a thin layer of living material surrounding a single large fat globule. The use of fatty tissue is to serve as a storehouse of food material for future use. In conformity with this it is packed away in parts of the body where it will not interfere with the working of the different tissues and organs, and in several positions is made use of as packing to fill up irregular spaces, e.g. between the eyeball and the bony socket of the eye.

Reticular Tissue.—This is a variety of connective tissue in which the reticulum of white fibres is built up of very fine strands leaving large interspaces in which the cells typical of the tissue are enclosed. The ground substance of the tissue is reduced to a minimum. Many connective tissue cells lie on the fibres which may in places be completely covered by them. This tissue therefore forms a groundwork holding together the main parts of an organ to form a compact whole. It may thus be demonstrated in lymphatic glands, the spleen, the liver, in mucous membranes and many other cellular organs.

White Fibrous Tissue.—This is the form of tissue in which the white fibres largely preponderate. The fibrous bundles may be all arranged parallel to one another to form a dense compact structure as in a tendon. It is found wherever great strength combined with flexibility is required and the fibres are arranged in the direction in which the stress has to be transmitted. In other instances the bundles may be united to form membranes, and in such cases the main number of bundles run in one direction only, which is again that in which the main stress has to be conducted. Such are the ligaments around the joints or the fasciae covering the muscles of the limbs, &c. In other positions, e.g. the dura mater, the fibrous bundles course in all directions, thus forming a very tough membrane. The cells of such tissues lie in the spaces between the bundles and are found flattened out in two or three directions where they are compressed by the oval fibrous bundles surrounding them (see figs. 2 and 3). The cells thus lie in linear groups running parallel to the bundles, presenting a very characteristic appearance.

Yellow Elastic Tissue.—This is the form of connective tissue mainly composed of elastic fibres. It is found in those positions where a continuous but varying stress has to be supported. In some positions the elastic tissue is in the form of branching fibres arranged parallel to one another and bound together by white fibres, e.g. ligamentum nuchae (fig. 4). In other cases it may be in the form of thin plates perforated in many directions to form a fenestrated membrane. In this type a series of such plates are arranged round the larger arteries forming a large proportion of the artery wall.

All the connective tissues are vascular structures though as the number of cells present is not great, and further as those cells are not as a rule the seat of a very active metabolism, the number

![Fig. 4.—Isolated elastic fibres of ligamentum nuchae. Branching fibres of very definite outline with irregularly placed transverse markings.](image-url)
of blood vessels is quite small. The tissues are also supplied with lymphatics and nerves.

**Cartilage.** — Cartilage or gristle is a tough and dense tissue possessing a certain degree of flexibility and high elasticity. It is found where a certain amount of flexibility is required but where a fixed shape must be retained, e.g. in the trachea which must always be kept open or in the external ear or pinna which owes its typical and permanent shape to the presence of cartilage. It is largely associated with the bones in the formation of the skeleton. The tissue consists of a number of cells embedded in a solid matrix or ground substance. Three varieties are distinguished according to the nature of the matrix. Thus if the matrix is homogeneous in structure the cartilage is termed *hyaline*. Two other forms occur in which fibrous tissue is embedded in the cartilage matrix. They are therefore termed fibro-cartilages and if the fibres are of the white variety the cartilage is called *white fibro-cartilage*, if of the yellow elastic form, *elastic cartilage*.

**Hyaline Cartilage** (fig. 5).—This consists of a number of rounded cells enclosed within a homogeneous matrix. The cells possess an oval nucleus and a granular, often vacuolated cell-body. The number of cells present varies considerably in different specimens. In freshly formed cartilage the cells are numerous, the amount of matrix separating them being small. Cartilage grows by a deposition of new matrix by the cartilage cells which thus become more and more separated from one another. After a time the cells divide and subsequently become detached from one another by deposition of fresh matrix between them. The cells are often to be seen in groups of two, three or four cells, indicating the common origin of each group from a parent cell. Towards the surface of the cartilage the cells are often modified in shape tending to become flattened in a direction parallel to the surface. Some of the cells near the surface of a piece of cartilage may be branched, appearing as a transition form between connective tissue corpuscles and typical cartilage cells. This is particularly the case at points where tendon or ligaments are attached. There may often be a deposit of lime salts in the matrix of hyaline cartilage especially in old animals or in the deeper layers of articular cartilage where it is attached to bone. A similar deposit of lime salts is well marked in the superficial parts of the skeleton of the cartilaginous fishes. In the development of animals possessing a bony skeleton, the skeleton is first laid down as hyaline cartilage which subsequently becomes gradually removed, bone being deposited in its place. In the adult, hyaline cartilage is found at the ends of the long bones (articulard cartilage), uniting the cartilage ends (e.g. the epiphyses), and forming the cartilages of the nose, trachea and bronchi, &c. This as well as the other forms of cartilage are non-vascular so that the cells must gain their food-stuffs and get rid of their waste products by a process of diffusion through the matrix, a process which must of necessity be slow.

**White Fibro-Cartilage.** — This is a variety of cartilage in which numerous white fibres ramify in all directions through the matrix (fig. 6). The cells lie separate and not in groups, and the amount of matrix between is commonly small. The white fibres may run in all directions or may chiefly run in one direction only. Under the microscope the tissue closely resembles a dense white fibrous tissue, only the cells enclosed in it are cartilage cells and not connective tissue cells. Owing to the presence of so much fibrous tissue this variety of cartilage is very much tougher than hyaline cartilage and less flexible. It is found in places which have to withstand a considerable amount of compression but where a less rigid structure than bone is demanded. Thus it is found forming the Intervertebral disks, the interarticular cartilages, or at the edges of joint surfaces to deepen the surface.

**Elastic Fibro-Cartilage.** — In this variety the matrix is permeated by a complex and well-defined meshwork of elastic fibres (fig. 7). The size of the fibres varies considerably in different specimens. It is found in parts which have to retain a permanent shape but where a considerable amount of flexibility is requisite, as in the pinna of the ear, the epiglottis, the cartilage of the Eustachian tube, &c.

**Bone.** — Bone is a connective tissue in which a considerable amount of mineral matter is deposited in the intercellular matrix whereby it acquires a dense and rigid consistency. If bone be incinerated so that the organic matter is burnt away, a residue of mineral matter is left. This consists chiefly of calcium phosphate, and amounts to as much as two-thirds of the weight of the original bone. If, on the other hand, bone be macerated in hydrochloric or nitric acid for a time the calcium phosphate is dissolved, leaving the organic matter practically unaffected and still showing the microscopic structure of bone. Hence it follows that the organic matrix is uniformly impregnated with the calcium salts.

According to its naked-eye appearance bone is distinguished as being either *compact* or *cancellated*. The former is dense like ivory and forms the outer surface of all bones. The whole of the shaft of a long bone is composed of this compact form. Cancellated bone has a spongy structure and contains large interspaces filled with a fatty tissue rich in blood vessels. This form of bone tissue is found forming the interior of most bones, especially the heads of the long bones, the interior of the ribs, &c. The cavity of the shaft of a long bone is filled, just as in the case of the smaller cavities in cancellated bone, with a fatty tissue, the Bone Marrow (see below).

The histological structure of bone may be made out from a piece of dried bone which has been ground down between grinding stones until it is sufficiently thin for microscopic purposes. If such a section be prepared from a thin transverse slice of a long bone the appearance pictured in fig. 8 will be seen. The section comprises a number of circular units bound into a compact whole by intervening material showing in the main the same structural details. Each of these circular structures is termed an Haversian system. In the centre of each is seen a dark area, the Haversian canal, around which the bone matrix is deposited in the form of a number of concentric laminae. Enclosed between the laminae are a number of small spaces also appearing black in this preparation. These are the bone lacunae and spreading away from them in directions generally transverse to the laminae are seen a large number of fine branching lines—the canaliculi. All parts of the preparation such as this which appear dark in reality represent spaces in the bone matrix. In the course of the preparation of the
specimen all these cavities have been filled up with finely divided débris and hence appear opaque. In the living bone these spaces are filled with a tissue or a cell or with fine protoplasmic processes. Thus the Haversian canal contains an artery and vein, some capillaries, a flattened lymph space, fine medullated nerve fibres—the whole being supported in a fine fatty tissue. Each lacuna is filled with a cell—the bone corpuscle—and the canaliculi contain fine branching processes of these cells. On comparing such a section with one taken parallel to the long axis of the shaft of a bone it is seen that the Haversian canals run some distance along the length of the bone, and that they frequently unite with one another or communicate by obliquely coursing channels. The spaces between the Haversian systems are filled in with further bony tissues which may or may not be arranged in laminae. Finally, the systems are as it were bound together by other laminae running parallel to the surface of the bone. If a piece of fresh bone be decalcified so that a thin section can be cut from it, the bone corpuscles can be seen filling up the lacunae but the section does not give so typical a picture as that already examined because it is not possible to make the protoplasmic structures filling the lacunae and canaliculi stand out in marked contrast with the surrounding matrix.

Cancellous bone only differs from compact bone in the arrangement of the bone tissue. This encloses a number of irregular spaces which communicate with one another to form a kind of spongework. Commonly the framework is so constructed that a number of trabeculae running parallel to one another are produced. This is for the purpose of especially strengthening the bone in that direction. This direction is in all cases found to be that in which the bone has to support its maximum strain while in position within the body. Usually the bone trabeculae are so narrow that there is no need for Haversian systems within them, and they therefore usually consist of a few laminae arranged parallel to the surface. These laminae include bone corpuscles as in the rest of the bone tissue.

Bone Marrow.—Filling the central cavity of the tubular bones and the cavities of the spongy bone tissue is a tissue largely composed of fat cells. This is the bone marrow. Two varieties are distinguished, the one being red in colour, the other yellow. Red marrow is composed of a number of fat cells lying in a tissue made up of large and small marrow cells and typical giant cells or myeloplasts (fig. 9). The whole of these elements are supported in a delicate connective tissue. The marrow cells exhibit manifold forms. Some are typical leucocytes and lymphocytes as found in circulating blood. Others named myelocytes are slightly larger than leucocytes, with round or oval nuclei, and a protoplasm containing neutrophile granules. Yet another variety contains large eosinophile granules in the protoplasm. These different types of cell probably develop into leucocytes.

In addition to fully developed red blood corpuscles there are also present numerous nucleated red blood cells (erythroblasts or haematoblasts). These are red blood corpuscles in an early stage of formation. They reach the blood after they have lost their nuclei.

**Fig. 8.—Section of Bone.** Showing four Haversian systems and interlying bone material. This is a dry preparation, hence all the cavities (such as the Haversian Canals, the lacunae and canaliculi), being filled with débris from the grinding, appear dark.

**Fig. 9.—Section of Bone Marrow.**

- **e.** Eosinophile cells.
- **my.** Myeloplasts.
- **r.** Red corpuscles.
- **m.** Marrow cells.
- **h.** Haematoblasts or erythroblasts.

**Development of Bone.**—The formation of new bone always takes place from connective tissue, but we may distinguish two different modes. In the first the bone is preceded by cartilage (development from cartilage), in the second the bone is laid down directly from a vascular fibrous membrane (development from membrane). The development of bone from cartilage is the more complicated of the two because in it bone formation is taking place in two positions at the same time and in two rather different manners. Thus bone is being laid down from the outside (perichondral formation) from the fibrous membrane surrounding the cartilage, the perichondrium and also within the substance of the cartilage (endochondral formation). Perichondral formation takes place somewhat earlier than endochondral and in the case of a long bone is first observed around the centre of the shaft, i.e. in that portion of the bone which forms the diaphysis. Here the perichondrium is vascular and carries on the surface next to the cartilage an almost continuous layer of typical cells cuboid in shape, the osteoblasts or bone-formers. Calcium salts are deposited in the matrix of the immediately subjacent cartilage and the cell spaces of the cartilage increase in size while the cartilage cells shrink. Further growth of cartilage ceases in this region so that at one time the shaft of the cartilage may appear constricted in the middle. The formation of bone endochondrally is ushered in by the ingrowth of blood vessels from the perichondrium. A way through the calcified matrix of the cartilage is made for them by a process of erosion. This is effected by a number of polynucleated giant cells, the osteoclasts, which apply themselves to the matrix and gradually dissolve it away. The enlarged cartilage spaces are thus opened to one another, and soon the only remnants of the matrix consist of a number of irregular trabeculae of calcified matrix. In this way the primary marrow spaces are produced, the whole structure representing the future spongy portion of the bone. The next step in both perichondral and endochondral bone formation consists in the deposition of bone matrix. This is effected by the osteoblasts. In the spongy portion they deposit a layer upon the surfaces of the calcified cartilage matrix, and thus in newly formed bone we find a central framework of cartilage matrix enclosed in a layer of bone matrix (see fig. 10). In the perichondral formation the deposition is effected in the same manner but is not uniformly spread over the whole surface, but trabeculae are formed. These become confluent at places, thus leaving spaces through which blood vessels and osteogenetic tissue pass to reach the interior of the bone. As the deposition of bone matrix proceeds, some of the osteoblasts become included within the matrix. These cease to form fresh matrix and in
fact become bone corpuscles. Increase in thickness of the new bone is effected by the deposition of fresh matrix followed again by the inclusion of further osteoblasts. The spaces within the trabeculae become in this way gradually narrowed by the deposition of matrix until at last only a narrow centre is left large enough to contain the blood vessels and their accompanying nerves, lymphatics and a small number of osteoblasts. Bone formation then ceases. In this manner the Haversian systems are produced.

Growth of the bone proceeds by the deposition of more matrix on the exterior, but simultaneously a process of absorption is also taking place. This is most typically seen within the spongy portion of the bone. The absorption of the trabeculae is effected by the osteoclasts. These become applied to the trabeculae and gradually eat their way into the matrix thus coming to lie within lacunæ. They possess the power of dissolving both bone and cartilaginous matrix. Side by side with this solution process we may often see new formation taking place by the activity of new osteoblasts (q. v.). In this manner the whole framework of the bone may be gradually replaced. The process is most active in embryos and very young animals, but also continues during the whole life of an animal, thus effecting alterations in shape and structure of the whole. Growth in the length of a bone is effected by formation of new bone at either end of the shaft. After the ossification centre has formed in the shaft (diaphysis) of the bone subsidiary centres make their appearance in the heads of the bones. These form, by a similar process of bone formation, fresh bone masses which, however, are not continuous with the bone tissue of the shaft. They are attached to the shaft by an intermediate piece of cartilage, and it is by a process of growth of this cartilage and its subsequent replacement by bone that growth in length of the whole bone is effected (fig. 10). This piece of intervening cartilage can be easily seen in a young bone and persists as long as the bone can increase in length. Thus in man the last junction of epiphysis to diaphysis may not take place until the 28th year. Development of bone in membrane shows a course in all respects very similar to perichondral bone formation. A layer of osteogenetic tissue makes its appearance in the membrane from which the bone is to be formed. In this tissue a number of stiff fibres are deposited which soon become covered and impregnated with calcium salts. Around these bundles of fibres numbers of osteoblasts are deposited and by them bone matrix is deposited in irregular trabeculae. The bone increases by the deposition of fresh matrix just as in perichondral bone formation and Haversian systems are formed after precisely the same manner as in that position. The factor determining the position of one of these systems is of course the presence of a blood vessel penetrating towards the deeper part of the bone.

**Muscle.**—Muscle is the contractile tissue of the body, that tissue by which the various parts of the body are moved. Thus it forms the main bulk of the limbs, back, neck and body wall. Most of the viscera too possess well-developed muscular coats. When separated into its constituent parts it is seen that muscle in all instances is built up of a number of long fibres. These are of three well-defined types. Those forming the skeletal muscles are of large size, even in some instances up to 12 cms. in length, their diameter varying from 0.01 to 0.11 mm. When these are examined under the microscope they are found to be characterized by possessing a decided transverse marking, and they are therefore known as striated muscle fibres. From the fact that they comprise those muscles which are under the control of the will they are also called voluntary muscle fibres. The second variety of muscle is made up of much smaller fibres varying in different parts from 0.05 to 0.15 mm. in length and about 0.005 mm. in diameter. These fibres show no transverse striations nor are they directly under the control of the will. They are therefore termed smooth or involuntary muscle. Lastly, there is a third type of muscle found in the heart which lies intermediate in structure between these two varieties. In this the fibres are small and show distinct transverse striations. Longitudinal striations are also present though somewhat less marked. In most respects this form of muscle fibre resembles smooth muscle more closely than striated muscle.

*Voluntary or Striated Muscle.* Each muscle fibre of which this is composed is what is known as a syncytium or plasmoid, i.e. a structure containing a number of nuclei, which has been formed from a single cell by proliferation of its nucleus without subdivision of the protoplasm. It is thus an assemblage of cells possessing a common protoplasm. Each fibre generally runs parallel to the length of the muscle and if that muscle is short extends the whole length. Thus the one end of the fibre may be attached to tendon when the end is rounded off. The other end may also terminate in tendon or in the fibrous covering of bone in which case it is again rounded. In long muscles, however, the fibre may only extend a certain distance along the muscle, and it is then found to terminate in a tapering or bevelled end. In some of the long muscles some of the fibres may both arise and terminate in the substance of the muscles. In such a case both ends are bevelled. All the fibres in a muscle are arranged parallel to one another.

The outer surface of each muscle fibre consists of a tough homogeneous membrane, the sarcolemma. The main muscle substance (see fig. 11) is composed of several parts, viz. the fibrillae, the sarcoplasm and the nuclei. Under the action of the muscle fibres the muscle fibrillae may be split into a number of longitudinal elements. These are the fibrillae. They possess alternate bands of light and dark substance which give them a striated appearance. When viewed under polarized light the dark substance is found to be doubly refracting or anisotropic, the light band is singly refracting or isotropic. According to many observers, in the centre of each isometric segment there is a thin transverse disk of anisotropic material and in the centre of each anisotropic segment a thin disk of isotropic substance.

The fibrillae are arranged in the muscle fibre parallel to one another and with the alternate light and dark bands at approximately the same level across the fibre, thus giving the whole muscle fibre its typical transverse striation. The fibrillae are united to one another by interfibrillar substance to form bundles, of which there may be a considerable number in each muscle fibre. The bundles lie in a surrounding layer of sarcoplasm which apparently represents the remaining portion of unaltered protoplasm of the syncytium. This structure of muscle is best seen in the transverse sections of the fibres. A number of areas separated by a clear protoplasm are then to be seen. The areas are formed by the bundles of fibrillae seen in transverse section,
the intermediate substance is the sarcoplasm. In some muscles, apparently, each fibrilla is surrounded by a considerable amount of sarcoplasm, in which case the fibrillae are easily isolated from one another and can be readily examined. This is the case in the wing muscles of insects. The nuclei of the fibre are arranged close under the sarcolemma. Each is surrounded by a small quantity of sarcoplasm and in shape is an elongated ellipse. In most cases the muscle fibres do not branch, though in a few instances, such as the superficial muscles of the tongue, branching is found.

**Involuntary or Smooth Muscle** (figs. 13 and 14).—This form of muscle tissue when separated into its single constituents is seen to consist of fibres possessing a typical long spindle shape. The central part is somewhat swollen and contains an elongated nucleus centrally placed. The ends of the fibres are drawn out and pointed sharply. There is no definite surrounding membrane to each cell. In most of the cells, especially the larger, a distinct longitudinal marking can be seen. This is due to the presence of the fibrils which run the length of the fibre and in all probability are the essential contractile elements.

In most instances the cells are arranged with one another in a tissue to form bundles or sheets of contractile substance. In each bundle or sheet the cells are cemented to one another so that they may all act in unison. The cementing material is apparently of a membranous character and is so arranged that contiguous fibres are only separated by a single layer of membrane. According to some, neighbouring fibres are connected to one another by minute offshoots, and these communications serve to explain the manner in which the contraction is observed to pass from fibre to fibre along a sheet composed of the muscles.

**Involuntary muscle** is the variety of muscle tissue found in the walls of the hollow viscera, such as stomach, intestines, ureter, bladder, uterus, &c., and of the respiratory passages, in the middle coats of arteries, in the skin, and the muscular trabeculae of the spleen. The arrangement is very typical, for instance, in the small intestine. Here the muscular coat consists of two layers of muscle. Each is in the form of a sheet which varies greatly in thickness in different animals. In the inner sheet the fibres, which are all parallel to one another, are disposed with their long axis transverse to the direction of the gut. In the outer layer, the direction of the fibres is at right angles to this. In a viscus with thick muscle walls the fibres are bound into bundles and the bundles may run in all directions. In some instances the bundles may form branching systems, thus constituting a network, as in the bladder (fig. 14). In other instances, e.g. the villi of the small intestine, the muscle fibres are separate, forming a felt-work with wide meshes.

**Heart Muscle.**—The fibres of which the muscular walls of the heart are composed though cross striated are not voluntary, for they are not under the control of the will. Each fibre is an oblong cell possessing distinct transverse and less distinct longitudinal striations (fig. 15). There is no sarcolemma, and the nucleus of each fibre is placed in the centre. The longitudinal striation is due to the presence of fibrillae, each of which is cross striated. These lie parallel to one another in the cell, the sarcoplasm surrounding them being much more abundant in these fibres than is striated muscle. The fibrillae are arranged in rows, and when a transverse section of one of these fibres is examined it is seen that the rows radiate away from the centre of the cell. A further distinctive character of cardiac muscle fibres is that they frequently branch, the branches uniting with others from neighbouring cells. Moreover, the ends of the fibres are attached to corresponding faces of other cells, and through these attached faces the fibrillae pass, so that there is an approximation to the formation of a syncytium.

**CONNELLITE,** a rare mineral species, a hydrous copper chloro-sulphate, Cu₄[Cl,OH]₂SO₄·15H₂O, crystallizing in the hexagonal system. It occurs as tufts of very delicate acicular crystals of a fine blue colour, and is associated with other copper minerals of secondary origin, such as cuprite and malachite. Its occurrence in Cornwall was noted by Philip Rashleigh in 1802, and it was first examined chemically by Arthur Connell in 1847. Outside Cornwall it has been found only in Namaqua-land in South Africa.

**CONNERSVILLE,** a borough of Fayette county, Pennsylvania, U.S.A., on the Youghiogheny river, about 60 m. S.S.E. of Pitts- burg. Pop. (1890) 5629; (1900) 7160, including 800 foreign-born; (1910) 13,845. It is served by the Pennsylvania, the Pittsburg and Lake Erie, and the Baltimore & Ohio railways, and by the interurban electric system of the West Penn Railway Co., which has a large power plant near Connellsville. Connellsville is the centre of the Connellsville coke district (in Fayette and Westmoreland counties), which has the largest production in the United States, the output in 1907 (13,080,472 tons) being 32.1% of that of the whole country. Connellsville coke is the standard grade. What is called the Lower Connellsville coke region lies in Fayette county S.W. of the Connellsville district. It is richest near Uniontown, and in 1907 produced 6,310,900 tons of coke, making it second only to Connellsville. The so-called Upper Connellsville (or Latrobe) district, near Latrobe, produced in 1907, 1,050,260 tons of coke. The combined output of these three districts was 50.1% of the total of the entire country. The borough of Connellsville has various manufactures including iron, tin plate, automobiles and various kinds of machinery; and a state hospital for the treatment of persons injured in mines is located here. Connellsville was first settled in 1770, was laid out as a town by Zachariah Connell, in whose honour it was named, in 1803, and was incorporat- ed in 1806. The borough of New Haven (pop. in 1900, 1532) was annexed to Connellsville after the census enumeration of 1900.

**CONNEMARA,** a wild and picturesque district in the west of Co. Galway, Ireland. (See Galway.)

**CONNERSVILLE,** a city and the county-seat of Fayette county, Indiana, U.S.A., situated on White Water river, in the east central part of the state, about 50 m. E. by S. of Indianapolis. Pop. (1900) 6856; (1910) 7738. It is served by the Cincinnati, Hamilton & Dayton, the Cleveland, Cincinnati, Chicago & St
CONNOR—CONNON

Louis, the Fort Wayne, Cincinnati & Louisville railways, and by the Indianapolis & Cincinnati Traction line (electric). It has a good water-power, and among its manufactures are wagons and carriages, axles, furniture, flour and electric signs. The water-works are owned and operated by the city. Connersville was first settled about the close of the war of 1812; was laid out in 1817 by John Conner, in whose honour it was named; and received a city charter in 1836.

CONNOR (or O'CONNOR), BERNARD (1666-1698), English physician, was born in Kerry, Ireland, and after studying at Montpellier and Paris, graduated at Reims in 1691. Having travelled through Italy with the two sons of the high chancellor of Poland, he was introduced at the court of Warsaw, and appointed physician to John Sobieski, king of Poland. In 1695 he went to England, where he lectured at Oxford, London and Cambridge, and became a member of the Royal Society and of the College of Physicians. He was the author of a treatise entitled Evangelium Medici (1697), in which he endeavoured to explain the Christian miracles as due to natural causes, and of a History of Poland (1698). He died in London in 1698.

CONNOTATION, in logic, a term (largely due to J. S. Mill) equivalent to Intension, which is used to describe the sum of the qualities and attributes belonging to any given thing and which are involved in the name by which it is known; thus the term “elephant” connotes the having a trunk, a certain shape of body, texture of skin, and so on. It is clear that as scientific knowledge advances the Connotation or Intension of terms increases, and, therefore, that the Connotation of the same term may vary considerably according to the knowledge of the person who uses it. Again, if a limiting adjective is added to a noun (e.g. African elephant), the Connotation obviously increases. In all argument it is essential that the speakers should be in agreement as to the Intension of the words they use. General terms such as “Socialism,” “Slavery,” “Liberty,” and technical terms in philosophy and theology are frequently the cause of controversies which would not arise if the disputants were agreed as to the Intension or Connotation of the terms. In addition Connotative terms, as those which imply attributes, are opposed to Non-Connotative, which merely denote things without implying attributes. See also DENOTATION; and any textbook on elementary logic, e.g. T. Fowler or W. S. Jevons.

CONOIDE, CONOISME, CONOISME (in geometry, the solids (or surfaces) formed by the revolution of a conic section about one of its principal axes. If the conic be a circle the conoid is a sphere (q.v.); if an ellipse a spheroid (q.v.); if a parabola a paraboloid; if a hyperbola the surface is a hyperboloid of either one or two sheets according as the revolution takes place about the conjugate or transverse axis, and the surface generated by the asymptotes is called the “asymptotic cone.” If two intersecting straight lines be regarded as a conic, then the principal axes are the bisectors of the angles between the lines; consequently the corresponding conoid is a right circular cone. It is to be noted that all these surfaces are surfaces of revolution; and they, therefore, differ from the surfaces discussed under the same names in the article Geometry: Analytical.

The spheroid has for its cartesian equation $(x^2+y^2)/a^2+z^2/b^2=1$; the hyperboloid of one sheet (of revolution) is $(x^2+y^2)/a^2-z^2/b^2=1$; the hyperboloid of two sheets $(x^2+y^2)/a^2-z^2/b^2=-1$; and the paraboloid of revolution is $z^2=x^2+y^2$.

CONOLLY, JOHN (1794-1866), English physician, was born at Market Rasen, Lincolnshire, of an Irish family, on the 27th of May 1794. He graduated M.D. at Edinburgh in 1821. After practising at Lewes, Chichester and Stratford-on-Avon successively, he was appointed professor of the practice of medicine at University College, London, in 1828. In 1830 he published a work on the Indications of Insanity, and soon afterwards settled at Warwick. In 1832 in co-operation with Sir Charles Hastings and Sir John Forbes, he founded a small medical association with a view to raising the standard of provincial practice. In later years this grew in importance and membership, and finally became the British Medical Association. In 1839 he was elected resident physician to the Middlesex County Asylum at Hamlin. In this capacity he made his name famous by carrying out in its entirety and on a large scale the principle of non-restraint in the treatment of the insane. This principle had been acted on in two small asylums—William Tuke's Retreat near York, and the Lincoln Asylum; but it was due to the energy of Conolly in sweeping away all mechanical restraint in the great metropolitan lunatic hospital, in the face of strong opposition, that the principle became diffused over the whole kingdom, and accepted as fundamental. In 1844 he ceased to be resident physician at Hamlin, but remained visiting physician until 1852. He died on the 5th of March 1866 at Hanwell, where in the later part of his life he had a private asylum. His works include Construction and Government of Lunatic Asylums (1847); The Treatment of the Insane without Mechanical Restrains (1856); and an Essay on Madness (1863).

CONON, son of Timotheus, Athenian general. After having held several commands during the Peloponnesian War, he was chosen as one of the ten generals who superseded Alcibiades in 406 B.C. He was defeated by the Spartan Callicratidas and shut up in Mytilene. The Athenian victory at Arginusae rescued him from calamity, and he soon afterwards at the battle of Ictis, he was not tried with the other generals, and was allowed to retain his command. In 405, however, the Athenian fleet was surprised by Lysander, at Aegospotami, and Conon with difficulty managed to escape with eight ships to his friend Evagoras, king of Cyprus. On the outbreak of the war between Sparta and the Persians (400) he obtained from King Artaxerxes joint command with Pharnabazus of a Persian fleet. In 394 he defeated the Lacedaemonians near Cnidus, and thus deprived them of the empire of the sea, which they had held since the taking of Athens. Sailing down the Aegean to Athens, he expelled the Lacedaemonian harmosts from most of the maritime towns, and finally completed his services to his country by restoring the long walls and the fortifications of the Peiraeus. According to one account, he was put to death by Tiribazus, when on an embassy from Athens to the Persian court to counteract the intrigues of Sparta; but it seems more probable that he escaped to Cyprus and died there about 390.

See Xenophon, Hellanics, iv. 3. 8; Justin vi. 3; Cornellius Nepos, Conon; Aischylos, Aristeiphon, 41-44; Isocrates, Panegg. 41; M. Schmidt, Das Leben Konons (1873), with notes and references to authorities.

CONON, Greek astronomer and geometer, flourished at Samos in the 3rd century B.C. He was the friend of Archimedes, who survived him. Conon is best known in connexion with the Coma Berenices (Hair of Berenice). Berenice, the wife of Ptolemy Euergetes, had dedicated her hair in the temple of Arsinoe of Zephyrium (Aphrodite Zephyritis) as an offering to secure the safe return of her husband from his Syrian expedition. It disappeared from the temple, and was declared by Conon to have been placed among the stars. The incident formed the subject of a poem by Callimachus, of which only a few lines are preserved, but we still possess the imitation of it by Catullus. Conon is also considered the inventor of the curve known as the "Spiral of Archimedes." He wrote a work on astronomy, which contained a collection of the observations of solar eclipses made by the Chaldaeans, and drew up a parapегma, or meteorological calendar, from his own observations. He also investigated the question of the number of points of intersection of two conics, and his researches probably formed the basis of the 4th book of the Conics of Apollonius of Perga.

CONON, grammarians and mythographer, flourished at Rome in the time of Caesar and Augustus. He was the author of a collection of myths and legends, relating chiefly to the foundation of colonies. The work, dedicated to Archelus Philopator, king of Cappadocia, contained 50 Narratives (Aστυγύματα, Narratives), an epitome, accompanied by brief criticisms, has been preserved in Photius (cod. 186). The style is good, being founded on the best Attic models, and the whole is agreeable to read. Nicolaus of Damascus is said to have made considerable use of the work (edition by U. Høfer, 1890).
CONQUEST—CONRAD II.

From that moment it is the duty of the conqueror to organize the regular government of the conquered territory on a footing of peace. As soon as this regular government has been established, to take human life, destroy property or otherwise disturb public order entails the penalties of the criminal law. A government which is strong enough to maintain its authority, which is in possession of and is de facto administering a country, is the government of that country, and, however just or interesting may be the cause of those who have been dispossessed, they are not entitled to treatment as belligerents. Thus in the South African War of 1899-1902 the British authorities, when the whole territory was occupied, manifestly beyond hope of recovery, might have ceased to treat the roving bands of armed men, who were still carrying on war, as belligerents. This, however, would probably have entailed reprisals; and when the Dutch government offered its good offices in January 1902, with a view to bringing the war to an end, the offer, though not accepted in the form of mediation, nevertheless led to negotiations which resulted in "terms of surrender" between delegates of the belligerents "acting as the government" of the two republics (31st of May 1902), which gave finality to the conquest and made individual resistance thereafter unquestionably an act of rebellion. The position of the remains of a regular force roving over a conquered country, in fact, is one which it is difficult to deal with under principles of law, men who have been fighting for the retention of their national independence differing essentially from insurgents.

(T. B.)

CONRAD, or KONRAD (M. H. Ger. Kuno, etc., "keen in counsel," Lat. Conradus, It. Corrado, cf. the A.S. Conrod), a German masculine proper name, borne by four German kings and emperors. The last of the Hohenstaufen, Conrad the younger, duke of Swabia, is known in history by the diminutive form Conrado (q.v.).

CONRAD I. (d. 918), German king, son of Conrad, count of Lahngau, was a member of an influential Franconian family, and was probably related to the German king Arnulf. He took part in the feud between his family and that of the Babenberg, and after his father's death in 906 passed much of his time at the court of Louis the Child, and assumed the title of "duke in Franconia." When Louis died in 911, Conrad was chosen German king at Forchheim on the 8th of November 911 owing to the efforts of Hatto I., archbishop of Mainz, and to the reputation he appears to have won in war and peace alike. Coming to the throne he found the unity of Germany threatened by the Magyars and the Normans from without, and by the growing power of the stem-duchies from within. He failed, however, to bring Lorraine into subjection, and was equally unsuccessful in his struggle with Henry, duke of Saxony, afterwards King Henry the Fowler. His subsequent years were mainly spent in warfare in Swabia and Bavaria, but owing to ill-health and the feebleness of his forces he was only partially successful in his attempts to restore peace. He died on the 3rd of September 918, and was buried at Fulda. About 914 Conrad married Kunigunde, a sister of Erchanger, count palatine in Swabia, and widow of Liutpert, margrave of Carinthia. He had no sons, and named his former enemy, Henry of Saxony, as his successor.

See E. Dümmel, Geschichte des ostfränkischen Reiche (Leipzig, 1887-1888); P. Stein, Geschichte des Königs Konrad I. von Franken (Hildesheim, 1872); F. Löber, Könige Konrad I. und Herzog Heinrich von Sachsen (Munich, 1857); Die Urkunde des deutschen Königs Konrad I., edited by Th. von Sickel in the Monumenta Germaniae historic. Diplomata (Hanover, 1879).

CONRAD II. (c. 990-1039), Roman emperor, founder of the Franconian or Saxon dynasty, was a son of Henry, count of Spira, grandson of Otto I., duke of Saxony; grandson of Conrad, wife of Conrado the Red, duke of Lorraine, a descendant of the emperor Otto the Great. He was Laut, 1904, pt. i. p. 64), "will take place when the conquering power has declared its will to annex it, and has established its authority throughout the territory, any opposition still made being on the scale of brigandage rather than of war, and no corner remains in which the ordinary functions of government are carried on in the name of the old state."
a member of the family of the Conradines, counts in Franconia, but the family estates had passed to another branch, and were held at this time by another Conrad, called the "younger" to distinguish him from his elder relative. He appears to have been a man of strong character, and owing to his skill in warfare, and especially to his marriage in 1016 with Gisela, widow of Ernest I., duke of Swabia, won position and influence in Germany. When the emperor Henry II. died in 1024, the two Conrads were the most prominent candidates for the throne, and are said to have mutually agreed to abide by the decision of the electors. After some delay the elder Conrad was elected German king early in September 1024. He owed his election to the support of the German bishops, especially that of Arbo, archbishop of Mainz, who crowned him in his cathedral on the 8th of September 1024; and the king's biographer, Wipo, remarks that Charlemagne himself could not have been welcomed more gladly by the people. Arbo, however, refused to perform this ceremony for Gisela, as she was within the prohibited degrees of affinity, and she was crowned some days later at Aix-la-Chapelle by Pilgrim, archbishop of Cologne. Conrad then travelled through his dominions, received tribute from tribes dwelling east of Saxony, and by his former March 1027, the kingdom was restored in the north, and the king went south. His position, however, was full of difficulty, and the various elements of discontent tended to unite. Boleslaus, duke of the Poles, took the title of king, and assumed a threatening attitude; Rudolph III., king of Burgundy or Arles, who had arranged that the emperor Henry II. should succeed him, refused to make a similar arrangement with Conrad; many of the Italians were hoping to obtain a king from France; and some German princes, including Conrad the younger, and the king's step-son Ernest II., duke of Swabia, showed signs of revolt.

The death of Boleslaus in 1025, and a cession of some lands north of the Elder to Canute, king of Denmark and England, secured the northern and eastern frontiers of Germany from attack, and the king's domestic enemies were soon crushed. In 1026 Conrad set out for Italy, and supported by Hildesheim, archbishop of Mainz, assumed the Lombard crown in that city, and afterwards overcame the resistance which was offered by Pavia and Ravenna. Travelling to Rome, he was crowned emperor in the presence of the kings of Burgundy and Denmark by Pope John XII., and afterwards made a tour of Italy, which he was compelled to return from. He then went to southern Italy, where by mingling justice with severity he secured respect for the imperial authority; and returned to Germany to find Ernest of Swabia, the younger Conrad, and their associates again in arms. One cause of this rising was the claim put forward by Ernest to the Burgundian succession, as King Rudolph was his great-uncle. But his efforts were unsuccessful, and in 1028 the revolt was suppressed; while in the meantime the emperor had met Rudolph of Burgundy at Basel, and had secured for himself a promise of the succession. The emperor's presence was soon needed in the east, where Messiaus, duke of the Poles, and Stephen I., king of Hungary, were ravaging the borders of Germany. An expedition against Stephen in 1029 was only partially successful, but he submitted in 1031, and in 1032 Messiaus was compelled to cede Lusatia to Conrad. In 1030 Ernest of Swabia was killed in battle; and in September 1032 the king of Burgundy died, and his kingdom was at once seized by his nephew Odo, count of Champagne. Collecting an army, Conrad marched into Burgundy in 1033, was chosen and crowned king of Burgundy, and after his rival from Nevers had been assassinated, was crowned at Geneva in 1034. Having asserted his authority over the Bohemians and other Slavonic tribes, Conrad went a second time to Italy in 1036 in response to an appeal from Hildesheim, whose oppressions had led to a general rising of the smaller vassals against their lords. An assembly was held at Pavia, and when Hildesheim refused to obey the commands of the emperor he was seized and imprisoned; but he escaped to Milan, where the citizens took up arms in his favour. Unable to take Milan, Conrad issued in May 1037 an edictum de beneficis, by which he decreed that the principle of heredity should apply in Italy to lands held by sub-

vassals, and that this class of tenants should not be deprived of their lands except by the sentence of their peers, and should retain the right of appeal to the emperor. Having crushed a rising at Parma and left the city in flames, Conrad restored Pope Benedict IX. to Rome, and marched into southern Italy, where he invested the Norman Rainulf with the county of Aversa, and gave the principality of Capua to Waimar IV., prince of Salerno. Returning to Germany, the emperor handed over the kingdom of Burgundy to his son Henry, afterwards the emperor Henry III., and proceeded to Utrecht, where he died on the 4th of June 1039. He was buried in the cathedral which he had begun to build at Spires.

Conrad did much for the strengthening of the German kingdom. Its boundaries were extended by the acquisition of Burgundy and the reconquest of Lusatia; disturbances of the peace became fewer and were more easily suppressed than heretofore; and three of the duchies, Bavaria, Franconia and Swabia, were made apanages of the royal house. Although he did not decree that German fiefs should be hereditary, he favoured the tendency in this direction, and so attempted to make the smaller vassals a check on the power of the nobles. He endeavoured to unite the great houses by the marriage between the families of the two countries, governed Henry of Lorraine by German officials, and ordered that the law of Justinian should supersede Lombard law in the Roman territories. He ruled the church with a firm hand; appointed his own supporters, regardless of their individual fitness, to bishops and abbots; and sought by inquiry to restore to the royal domain the estates granted to the church by his predecessors.

CONRAD III. (1093–1152), German king, second son of Frederick I., duke of Swabia, and Agnes, daughter of the emperor Henry IV., was the first king of the Hohenstaufen family. His father died in 1105, and his mother married secondly Leopold III., margrave of Austria; but little is known of his early life until 1115 when his uncle the emperor Henry V. appointed him duke of Franconia. In 1116, together with his elder brother Frederick II., duke of Swabia, he was left by Henry as regent of Germany, and when the emperor died in 1125 he became titular king of Burgundy, or Arles. Returning from the Holy Land in 1126, he took part in the war which during his absence had broken out between his brother Frederick and the new king, Lothair the Saxo, who was crowned king of Burgundy at Cahors by Pope Lucius III. on the 15th of December 1127. His election in preference to Frederick was possibly due to the fact that owing to his absence from Germany he had not taken the oath of fealty to the new king. Hastening across the Alps he was crowned king of Italy at Monza in June 1128, and in spite of the papal ban was generally acknowledged in northern Italy. His position, however, rapidly weakened. The rival popes, Innocent II. and Anacletus II., both declared against him; the Romans repudiated him; and after failing to seize the extensive possessions left by Matilda, marchioness of Tuscany, he returned to Germany in 1132. He continued the struggle against Lothair till October 1135, when he submitted, was pardoned, and recovered his estates; owing this generous treatment, it is said, to the good offices of
CONRAD IV.—CONRAD THE RED

967

St. Bernard, abbot of Clairvaux. In 1136 he accompanied the imperial forces to Italy in the capacity of standard-bearer, distinguished himself by his soldierly skill, and in view of the increasing age and infirmity of Lothair, sought to win the favour of Pope Innocent II.

In December 1137 Lothair died, and some of the princes met at Coblenz, and chose Conrad for a second time as German king on the 7th of March 1138, in presence of the papal legate. Crowned at Aix-la-Chapelle six days later, he was acknowledged at Bamberg by several of the South German princes; but his position could not be strong while Henry the Proud, the powerful duke of Bavaria and Saxony, refused his allegiance. Attempts at a peaceful settlement of this rivalry failed, and Henry was placed under the ban in July 1138, when war broke out in Bavaria and Saxony. The king was unable to make much headway, in spite of the death of Duke Henry, which occurred in October 1139; and his half-brother Leopold IV., margrave of Austria, to whom Bavaria had been entrusted, was defeated by Henry's brother Welf, afterwards duke of Spoleto and margrave of Tuscany. Conrad, however, captured the fortress of Weinsberg from Welf in December 1140, and is said to have allowed the women to leave the town, each with as much of her property as she could carry on her back. To his surprise, the story runs, each one of them turned back her back to the conqueror father-in-law, who thus escaped the vengeance of the conquerors. This tale is now regarded as legendary, and the same remark also applies to the tradition that the cries Hi Wofen, hi Wibelinnen, were first raised at this siege. Peace was made at Frankfurt in May 1142, when Henry the Lion, son of Henry the Proud, was confirmed in the duchy of Saxony, while Bavaria was given to Conrad's step-brother Henry Jasomirgott, margrave of Austria, who married Gertrude, the widow of Henry the Proud.

Affairs in Italy demanded the attention of the king, as Roger I., king of Sicily, had won considerable authority on the mainland, and refused to recognize the German king, whose help Pope Lucius II. implored against the rebellious Romans. This state of affairs drove Conrad into alliance with the East Roman emperor, Manuel Comnenus, who in 1146 married his step-sister; but the condition of Germany prevented the contemplated campaign against Roger. The solitary success amid the general disorder in the Empire was the expedition undertaken in 1144 by Conrad into Bohemia, where he restored his brother-in-law Ladislaus to the throne. He attempted to perform the same service for another brother-in-law, also called Ladislaus, who had been driven from his Polish dukedom, ended in failure. Meanwhile Germany was ravaged and devastated by civil war, which Conrad was unable to repress. Disorder was rampant in Saxony, Bavaria and Burgundy; and in 1146 war broke out between the Bavarians and the Hungarians. A term was placed to this condition of affairs by the preaching of Bernard of Clairvaux, and the consequent departure of many turbulent nobles on crusade. In December 1146 the king himself took the cross, secured the election and coronation of his young son Henry as his successor, appointed Henry I., archbishop of Mainz, as his guardian, and set out for Palestine in the autumn of 1147. Marching with a large and splendid army through Hungary, he reached Asia Minor, where his forces were decimated by disease and by the sword. Stricken by illness, Conrad returned to Constantinople at Christmas 1147, but in March 1148 set out to rejoin his troops. Having shared in the fruitless attack on Damascus, he left Palestine in September 1148, and passed the ensuing winter at Constantinople, where he made fresh plans for an attack on Roumelia. He then set out for Byzantium, but the news that Roger had allied himself with Louis VII., king of France, and his old opponent Welf of Bavaria, compelled him to return hastily to Germany, which was again in disorder. He was obliged to neglect repeated invitations from the Romans, who sent him a specially urgent letter in 1149, and consequently never received the imperial crown.

Conrad died on the 15th of February 1152 at Bamberg, where he was buried. By his wife, Gertrude, daughter of Berenger, count of Suzalbach, he had two sons, the elder of whom, Henry, died in 1150. Passing over his younger son Frederick on account of his youth, he appointed as his successor his nephew Frederick III., duke of Swabia, afterwards the emperor Frederick I. Conrad possessed military talents and had many estimable qualities, but he lacked perseverance and foresight, and was hampered by his obligations to the church.

The chief authority for Conrad's life and reign is Otto of Freising, "Chronicon," in the Monumenta Germaniae historica. Scriptores, Band xx. (Hanover and Berlin, 1826-1892). The best modern authorities are L. von Ranke, Weltgeschichte, achter Teil (Leipzig, 1864); W. von Loehe, Geschichte der deutschen Kaiserzeit, Band iv. (Brunswick, 1877); J. Jastrow, Deutsche Geschichte im Zeitalter der Hohenstaufen (Berlin, 1893); Ph. Jaffé, Geschichte des deutschen Reiches unter Lothar dem Sachsen (Berlin, 1843); V. Bérard, Conrad III. (Leipzig, 1883); O. von Heimann, Lothar der Sachsen und Konrad III. (Halle, 1886).

CONRAD IV. (1228-1254), German king, son of the emperor Frederick II. and Isabella of Brienne, was born at Andria in Apulia on the 26th of April 1228. In 1235 he was made duke of Swabia and in 1237 was chosen king of the Romans, or German king, at Vienna, in place of his half-brother Henry, an election which was subsequently confirmed by the diet at Spires. After spending some time in Italy he returned to Germany and began to take part in the quarrel which had arisen between the emperor and the pope. In 1240 he called an assembly to Eger, where many of the princes declared openly against the pope, and was soon in arms against Siegfried, archbishop of Mainz, the leader of the papal party in Germany. Although defeated near Frankfurt in August 1245 by the anti-king, Henry Raspe, landgrave of Thuringia, he obtained help from the towns and from his father-in-law Otto II., duke of Bavaria, and drove Henry Raspe to Thuringia. He was carrying on the struggle against Henry Raspe's successor, William II., count of Holland, when the emperor died in December 1250, and a few days later Conrad narrowly escaped assassination at Regensburg. Assuming the title of king of Jerusalem and Sicily, he raised an army by pledging his Swabian estates and marched to Italy in 1251, where with the help of his illegitimate half-brother, Manfred, he overran Apulia and took Capua and Naples. He was preparing to return to Germany at the head of a large army when he died at Lavello on the 21st of May 1254. In September 1246 he married Elizabeth (d. 1273), daughter of Otto of Bavaria, by whom he left a son, Conradin, whom he had never seen.

See F. W. Schirmacher, Die letzten Hohenstaufen (Göttingen, 1871); C. Rodenberg, Inconnu IV. et le Konigstum Steuern, 1245-1254 (Halle, 1892); W. Kempt, Geschichte des deutschen Reiches während des grossen Innungskrieges (Würzburg, 1898); and E. Winkelmann, Kaiser Friedrich II. (Leipzig, 1889).

CONRAD (d. 955), surnamed the "Red," duke of Lorraine, was a son of a Franconian count named Werner, who possessed on both banks of the Rhine. He rendered valuable assistance to the German king Otto, afterwards the emperor Otto the Great, and in 944 was made duke of Lorraine. In 947 he married Otto's daughter Liutgarde (d. 952), and afterwards took a prominent part in the struggle between Louis IV., king of France, and Hugh the Great, duke of Paris. He accompanied his father-in-law to Italy in 951, and when Otto returned to Germany in 952, Conrad remained behind as his representative, and signed a treaty with Berengar II., king of Italy, which brought about an estrangement between the German king and himself. He entered into alliance with his brother-in-law Ludolf, and taking up arms against Otto, seized the person of the king, afterwards resisting successfully all attempts to recover him. He afterwards invaded Lorraine; treated with the Magyars for support, but submitted to Otto in June 952, when he was deprived of his duchy, though permitted to retain his hereditary possessions. He was killed on the Lechfeld on the 10th of August 955, while fighting loyally for Otto against the Magyars, and was buried at Worms. He left a son Otto, who was the grandfather of the emperor Conrad II. Conrad is greatly lauded for his valour by contemporary writers, and the historian Widukind speaks very highly of his qualities both of mind and of body.
CONRAD OF MARBURG—CONRAD

CONRAD OF MARBURG (c. 1180–1233), German inquisitor, was born probably at Marburg, and received a good education, possibly at the university of Bologna. It is not certain that he belonged to any of the religious orders, although he has been claimed both by the Franciscans and the Dominicans. Early in the 13th century he appears to have won some celebrity as a preacher, and in 1214 was commissioned by Pope Innocent III. to arouse interest in the proposed crusade. After continuing this work for two or three years Conrad vanishes from history until 1226, when he is found occupying a position of influence at the court of Louis IV., landgrave of Thuringia. He became confessor to the landgrave's wife St. Elizabeth of Hungary (9.6.), and exercised the landgrave's rights of clerical patronage during his absence on crusade. In 1227 he was employed by Pope Gregory IX. to extirpate heresy in Germany, to denounce the marriage of the clergy, and to visit the monasteries. He carried on the crusade against heretics with great zeal in Hesse and Thuringia, but especially in the district around the mouth of the Weser inhabited by a people called the Stedinger. In 1223 he accused Henry III., the Stedinger, of being a chivalrous robber, which indignation he stimulated. An assembly at Mainz of bishops and princes declared Henry innocent, but Conrad demanded that this sentence should be reversed. This was his last work, for as he rode from Mainz he was murdered near Marburg on the 30th of July 1233. He left an Epistola ad papam de miraculis Sanctae Elisabethae, which was first published at Cologne in 1563. Conrad is chiefly known to English readers through Charles Kingsley's King's Tragedy, in which he is a prominent character. See E. L. T. Henke, Konrad von Marburg (Marburg, 1861), B. Kaltner, Konrad von Marburg und die Inquisition in Deutschland (Prague, 1882); A. Hausnath, Der Kaisermeister Konrad von Marburg (Leipzig, 1883); J. Beck, Konrad von Marburg (Breslau, 1871).

CONRAD OF WÜRZBURG (d. 1287), the chief German poet of the second half of the 13th century. As little is known of his life as that of any other epic poet of the age. By birth probably a native of Würzburg, he seems to have spent part of his life in Strassburg and his later years in Basel, where he died on the 31st of August 1287. Like his master, Gottfried of Strassburg, Conrad did not belong to the nobility, from which most of the poets of the time sprang. His varied and voluminous literary work is comparatively free from the degeneration which set in so rapidly in Middle High German poetry during the 13th century. His style, although occasionally diffuse, is dignified in tone; his metre is widely influenced by Gottfried's tendency to relieve the monotony of the epic metre with ingenious variations, but it is always correct; his narratives—if we except Die halbe Birn, of which the authorship is doubtful—are free from coarseness, to which the popular poets of the time are prone, and although mysticism and allegory bulk largely in his work they were not allowed, as in so many of his contemporaries, to usurp the place of poetry. Conrad has written a number of legends (Alexius, Silvester, Pontaleon) illustrating Christian virtues and dogmas: Der Welt Lohn, a didactic allegory on the familiar theme of "Frau Welt," the woman beautiful in front, unselfishly and loathsomely behind. Die goldene Schmiede is a paragogy of the Virgin; the Klage der Kunst, an allegorical defence of poetry. His most ambitious works are two enormously long epics, Der trojanische Krieg (of more than 40,000 verses and unfinished at that!) and Partenopier und Melisur, both of which are based on French originals. Conrad's powers are to be seen to best advantage in his shorter verse romances, such as Engelhart und Engelbrut, Kaiser Otto and Das Hersemaere; the last mentioned, the theme of which has been made familiar to modern readers by Uhland in his Kastellan von Coucy, is one of the best poems of its kind in Middle High German literature.

There is no uniform edition of Conrad's works. Der trojanische Krieg was edited by A. von Kelling for the Stuttgart Literarische Verein (1858); Partenopier und Melisur, by K. Hartung (1871); Die goldene Schmiede and Silvester, by W. Grimm (1840 and 1841); Alexius, by H. F. Massmann (1843) and R. Henczynsky (1898); Der Welt Lohn, by F. Roth (1843); Engelhart und Engelbrut, by M. Haupt (1844, 2nd ed., 1890); Klage der Kunst, by E. Joseph (1885). The shorter poems, Otto und Hersemaere, will be found most conveniently in Erzählungen und Erzählakte des Mittelalters, edited by H. Lambel (2nd ed., 1885). Modern German translations of Conrad's most popular poems have been published by K. Pannier and H. Krüger in Reclam's Universal Bibliothek (1879–1891). On Conrad see F. Pfeifer in Germania, ii. (1867), and W. Kohler in the Allgemeine deutsche Biographie, vol. 44 (1898), s.v. "Würzburg, Konrad von."

CONRAD, JOSEPH (1856– ), English novelist, was born in Poland, his full name having been Joseph Conrad Korzeniowski. He learnt French in infancy, but did not learn English until he was nearly twenty. At Constantinople, where he had gone with the intention of joining the Russians against the Turks, he joined the French merchant navy. Later on he found his way to Lowestoft in England, and, after obtaining his mate's certificate, he sailed for the East in an English ship. The story of this voyage is told in Youth, and other Tales (1902). His chief other volumes are Aylmer's Folly (1895), An Outcast of the Islands (1896), The Nigger of the Narcissus (1897), Tales of Unrest (1898), Lord Jim (1900), Typhoon (1903), The Mirror of the Sea (1906), and, with F. M. Hueffer, Romance (1903). All these are remarkable for their vigorous English style, and the vivid description of exotic scenes; the author being especially successful in tracing the effects of tropical surroundings and the contact with Asians on European sailors and traders. His play One Day More was produced by the Stage Society in June 1905.

CONRADIN, or Conrad the Younger (1252–1268), king of Jerusalem and Sicily, son of the German king Conrad IV., and Elizabeth, daughter of Otto II. duke of Bavaria, was born at Wöllstein in Bavaria on the 25th of March 1252. Having lost his father in 1254 he grew up at the court of his uncle and guardian, Louis II. duke of Bavaria; but little is known of his appearance and character except that he was "beautiful as Absalom, and spoke good Latin." Although he had been entrusted by his father to the guardianship of the church, he was pursued with relentless hatred by pope Innocent IV., who sought to bestow the kingdom of Sicily on a foreign prince. Innocent's successor, Alexander IV., continued this policy, offered the Hohenstaufen lands in Germany to Alphonsus X. king of Castile, and forbade Conradin's election as king of Rome. In 1267, while in the service of the German king in Sicily, Conradin took possession of the duchy of Salerno in 1262, and remained for some time in his dukedom. Conradin's first invitation to Italy came from the Guelphs of Florence, by whom he was asked to take arms against Manfred, who had been crowned king of Sicily in 1268. This invitation was refused by Louis on his nephew's behalf, but after Manfred's fall in 1266 envouys from the Ghibelline cities came to Bavaria and urged him to come and free Italy. Pledging his lands, he crossed the Alps and issued a manifesto at Verona setting forth his claims to Sicily. Notwithstanding the defection of his uncle Louis and other companions who returned to Germany, the threats of Pope Clement IV., and lack of funds, his cause seemed to prosper. Proclaimed king of Sicily, his partisans both in the north and south of Italy took up arms; his envoy was received with enthusiasm in Rome; and the young king himself was welcomed at Pavia and Pisa. In November 1267 he was excommunicated; but his fleet was victorious over that of Charles duke of Anjou, who had taken possession of Sicily on Manfred's death; and in July 1268 he was himself greeted with immense enthusiasm at Rome. Having strengthened his forces, he marched towards Lucera to join the Saracens. On the 23rd of August he was defeated by the Saracens, led by Charles of Tagliacozzo, but was saved by the aid of his soldiers to obtain peace and victors and return to the French. Escaping from the field of battle Conradin reached Rome, but on advice to leave the city he reached Astura, where he was seized and handed over to Charles of Anjou. At Naples he was tried as a traitor, and on the 29th of October was beheaded with his friend and companion Frederick

968
of Baden, titular duke of Austria. With his death the Hohenstaufen family became extinct. His remains, with those of Frederick of Baden, still rest in the church of the monastery of Santa Maria del Carmine at Naples, founded by his mother for the good of his soul: and here in 1847 a marble statue, by Thorwaldsen, was set up in memory by Maximilian, crown prince of Bavaria. In the great 14th century "Manesse" MS. (c) collection of medieval German lyrics, preserved at Heidelberg, there are two songs written by Conrardin, and his fate has formed the subject of several dramas.

**CONRART** (or **CONRAD**, VALENTIN (1603–1673), one of the founders of the French Academy, was born in Paris of Calvinist parents. He was educated for a commercial life; but after his father's death in 1620 he began to come into contact with men of letters, and soon acquired a literary reputation, though he wrote nothing for many years. He was made councillor and secretary to the king; and in 1620 his house became the resort of men of letters, who met to talk over literary subjects, and to read and mutually criticize their works. Cardinal Richelieu offered the society his protection, and in this way (1635) the French Academy was created. Its first meetings were held in the house of Conrart, who was unanimously elected secretary, and discharged the duties of his post for forty-three years, till his death on the 23rd of September 1675. The most important of Conrart's works is his Mémoires sur l'histoire de son temps published by L. J. N. de Monmerqué in 1825.

See also R. Kerviler and Édouard de Barthélemy, Conrart, sa vie et sa correspondance (1881); C. B. Petitot, Mémoires relatifs à l'histoire de France, tome xlvii.; and Sainte-Beuve, Causiers du lundi (19 juillet 1838).

**CONSALVI, ERCOLE** (1757–1834), Italian cardinal and statesman, was born at Rome on the 8th of June 1757. His grandfather, Gregorio Brunacci, of an ancient family of Pisa, had changed his name in order to become heir to a certain marchese di Consalvi. Ercole, who was the eldest of five children early left orphans, began his education at the Piarist college at Urbino. Removed thence on account of the cruel treatment he and his brother received, he went to the college opened at that time by Cardinal Henry of York at Frascati. Here Consalvi soon became one of the cardinal's favourite protégés. In 1776 he entered the Academia Ecclesiastica at Rome, in which Pope Pius VI. took a strong personal interest. This led to his being appointed in 1783 camaroire segreto to the pope, an office which involved the duty of receiving those who desired an audience. Next year he was made a domestic prelate and shortly afterwards a member of the Congregazione del buon governo. His further promotion was rapid; at the instance of Pope Pius, who thought his talents would be best employed at the bar, he became rotatore di segnatura, and, on the first vacancy, auditor of the Rota for Rome. This last post left him plenty of leisure, which he used for travelling and cultivating the society of interesting people, a taste which earned him the title of Monsignore Ubique. When the outbreak of the French Revolution made a reorganization of the papal army necessary, this was carried out by Consalvi as assessor to the new military Congregation.

In 1798, when the French occupied Rome, Consalvi was imprisoned in the castle of St Angelo, together with other papal officials. In retaliation for the murder of General Duhouet, a proposal to whip him through the streets was defeated by the French general in command, but, after three months' confinement, he was deported with a crowd of galley slaves to Naples, and his property was confiscated as that of "an enemy of the Roman republic." He managed with difficulty to reach Pius VI., who had sought refuge in the Certosa of Chè Val d'Ema, and was present at his death-bed. As secretary to the conclave which assembled in the monastery of San Giorgio Maggiore at Venice, Consalvi had the difficult task of corresponding with the various governments and organizing the assembly at a time when the Revolution had confused all issues and reduced the individual cardinals to begging. In this his diplomatic ability was conspicuous evident, and it was also largely owing to his influence that Cardinal Chiaromonte was elected as Pius VII. (March 14, 1800). On the 3rd of June Consalvi received in person the rescript from Rome; on the 14th of August Consalvi was appointed cardinal-priest of San Barnaba, and received the regalia. On his landing at Genoa he went straight to Paris, where he found Consalvi possessed just the qualities necessary to supplement those of Pius. The Pope was above all a religious man, of a gentle and contemplative character; the cardinal was pre-eminently a man of affairs. Their personal sympathy for each other continued to the end, though the notorious judgmental political views differed. Pius, who had openly expressed a sympathy with the freedom of France, was accused of "Jacobinism"; Consalvi, bringing up in the legitimist atmosphere of the entourage of Cardinal York, was a converted supporter of the divine right of kings generally and of Louis XVIII. in particular. But, though opposed to the principles of the Revolution, Consalvi was far from being a blind obscurantist, and he recognized the urgent need for reform in the system of papal government. In this, despite bitter opposition, he made many significant changes. He permitted laymen to hold certain public offices, under surveillance of the prelates, organized a guard from among the Roman nobility, decreed a plan for redeeming the lands, a general and contractual living of the clerics, and the necessary recognition of the public debt. In the long debates between Rome and France about the Concordat Consalvi took the leading part. In June 1801 he arrived in Paris, where his handsome presence, urban manners, and conspicuous ability made him a general favourite. Even Napoleon, though enraged at the firmness with which he maintained the papal claims, could not resist his personal fascination. It was largely owing to Consalvi's combined firmness and tact that the Concordat, as ultimately signed, was free from the objectionable clauses on which the first Consul had at first insisted. During the pope's absence in Paris, at the coronation of Napoleon, Consalvi remained as virtual sovereign in Rome; and his regency was rendered remarkable by a great inundation, caused by the overflow of the Tiber, during which he exposed himself with heroic humanity for the preservation of the sufferers. Not long after the return of the pope the amity between the Vatican and the Tulleries was again broken. Rome was full of anti-revolutionary and anti-Napoleonic stragglers from all parts of Europe. The emperor was irritated, and his ambassador, Cardinal Fesch, kept up the irritation by perpetual complaints directed more especially against Consalvi himself. "Tell Consalvi," wrote the conqueror, still flushed with Austerlitz, "that if he loves his country he must either resign or do what I demand." Consalvi did accordingly resign on the 17th of June 1807, and when in 1808 General Moliès entered Rome, and the temporal power of the pope was formally abolished, he broke off all relations with the French, though many of his intimate friends. In 1809 he was at Paris, and, in a remarkable interview, received from Napoleon's own lips an apology for the treatment he had received. With unbending dignity, however, he retained his antagonism; and shortly afterwards he was one of the thirteen cardinals who refused to attend the ceremony of the emperor's marriage with Marie Louise. For this display of independence he was imprisoned at Reims, and not released till some three years later, when Napoleon had extorted terms from the captive at Fontainebleau. On his release Consalvi hastened to his master's assistance, and he was soon after allowed to resume his functions under the restored pontificate at Rome.

In 1814 Consalvi went, as the pope's representative, to England to meet and confer with the allied sovereigns, and later in the year was sent as papal plenipotentiary to the congress of Vienna. Here he was successful in obtaining the restitution to the pope of the Marches (Ancona, Treviso and Ferrara) and Legations (Bologna, Ferrara and Ravenna), but he failed to prevent Austria from accepting the ancient papal possessions on the bank of the Po and obtaining the right to garrison Ferrara and Comacchio. This led to his presenting at the close of the congress
CONSANGUINITY—CONSCIENCE, H.

a formal protestatio, in which he not only denounced the failure of the Powers to do justice to the church, but also their refusal to re-establish that "centre of political unity," the Holy Roman Empire.

The rest of Consalvi's life was devoted to the work of re-organizing the States of the Church, and bringing back the allegiance of Europe to the papal throne. He was practically governor of Rome; and Pius was so much under his control that "Pasquin" said the pope would have to wait at the gates of paradise till the cardinal came from purgatory with the keys. Nor was the affectionate confidence of the pope misplaced. Consalvi's rule, in times of singular difficulty and unrest, was characterized by wisdom and moderation. He had to steer a middle course between the extremes represented by the Carbonari on the one hand and the Sanfedisti on the other, and he consistently refused to employ the cruel and inquisitorial methods in vogue under his successors. His foreign policy was guided by the traditional antagonism of the papacy to German domination in Italy, and generally by a desire to free the Holy See as far as possible from the political entanglements of the age. Thus he resisted all Metternich's efforts to draw him into his "system"; maintained the doctrine of non-intervention against the majority of the Powers of the continental alliance; protested at the congress of Troppau against the suggestions of the primate of Poland in regard to the disposal of the territories of interpolation to the States of the Church; and at Verona joined with Tuscany in procuring the rejection of Metternich's proposal for a central committee, on the model of the Mainz Commission, to discover and punish political offences in Italy.

On the death of Pius VII. (August 21, 1823), Consalvi retired to his villa of Porto d'Anzio; and, though he accepted from the new pope the honorific office of prefect of the college De Propaganda Fide, his political career was closed. He died on the 24th of January 1824. By his will he directed that all the presents he had received should be sold, and the proceeds applied to the completion of Thorwaldsen's monument of Pius VII. in St Peter's.

Consalvi, besides being a statesman, was a man of wide and varied interests. As a young abate he had followed the fashion of writing verses, and to the end he remained a notable patron of the arts and sciences, music being his main passion. For the city of Rome he did much; ancient buildings were excavated and preserved by his intervention; natural science and archaeology were founded in the university; many choirs were made for the Vatican museum, which was augmented by the addition of the beautiful Braccio Nuovo, or new wing.

Cardinal Consalvi's Mémoires were published in two vols. by S. Crénejole-17 (Paris, 1864). Other collections of documents are—C. von Duern, Correspondence du Cardinal Consalvi avec le Prince C. de Metternich, 1815 (Leuven and Brussels, 1890); S. Riniere, Correspondence inédite des Cardinals Consalvi et Pocca, 1814-1815 (Turin, 1903). See J. L. Bartholdy, Züge aus dem Leben des Cardinal Heroicle Consalvi (Stuttgart, 1854); Cardinal Wiseman, Recollections of the Last Four Popes (London, 1858); Crénejole-17, L'Église romaine en face de la Révolution (1889); Ernest Daudet, Le Cardinal Consalvi (Paris, 1866); E. L. Fischer, Cardinal Consalvi (Mainz, 1899); Dr Fredrik Nielsen, bishop of Aarhus, Hist. of the Papacy in the 10th Century (2 vols., Eng. trans. by A. J. Mason, D.D., London, 1900), which treats of Consalvi's work in great detail. For other general authorities see Cambridge Modern History, bibliographies to vol. ix. chap. vii., by L. G. Wickham-Legg, and vol. x. chap. v., by Lady Blennerhasset.

CONSANGUINITY, or Kindred, in law, the connexion or relation of persons descended from the same stock or common ancestor (vixium personarum ab eodem stipile descendentium). This consanguinity is either lineal or collateral. Lineal consanguinity is that which subsists between persons of whom one is descended in a direct line from the other, while collateral relations descend from the same stock or ancestor, but do not descend the other. Colateral relations, then, are such as arise naturally from one and the same ancestor, who is the stirps, or root, as well as the stipes, trunk or common stock, whence these relations branch out. It will be seen that the modern idea of consanguinity is larger than that of cognatio in the civil law, which was limited to connexion through males, and was modified by the ceremonies of adoption and emancipation, and also than that of cognatio, which did not go beyond the sixth generation, and was made the basis of Justinian's law of succession. The most limited idea of consanguinity was brothers or sisters by the same father, as opposed to ulterni, brothers or sisters by the same mother. The degrees of collateral consanguinity were differently reckoned in the civil and in the canon law. "The civil law reckons the number of descendants between the persons on both sides from the common ancestor. The canon law counts the number of descendants between the common ancestor and the two persons on one side only," and always on the side of the person who is more distant from the common ancestor. English law follows the canon law in beginning at the common ancestor and reckoning downwards. The question of consanguinity owes its great importance to the relationship it bears to the laws of marriage and inheritance. For instance, the law forbids marriage between persons within certain degrees of consanguinity and affinity, a prohibition which applies with equal force to a bastard as well as to those born in wedlock. The laws of inheritance and descent are regulated in a great measure according to consanguinity, however they may vary in different jurisdictions.

Apart from those countries which have made either the civil or the canon law the basis of their systems of consanguinity (and practically all civilized countries adopt one or other), it is impossible to describe any method or system, for they are as various as the countries and tribes. See, however, the article INDIAN LAW; and consult Lewis H. Morgan, Systems of Consanguinity and Affinity of the Human Family (Washington, 1870); J. F. McLennan, On Primitive Marriage (Edinburgh, 1865); E. A. Westernhake, History of Human Marriage (and ed., London, 1894); E. Crawley, The Marriage Rule (1902); J. N. Atkinson, Social Origin and Primacy (1903); E. B. Tyler, Primitive Culture (4th ed., 1911). See also Affinity; Marriage; Inheritance.

CONSCIENCE, HENDRIK (1812-1883), Flemish writer, was born at Antwerp on the 3rd of December 1812. Although he invariably signed his name Hendrik, his baptismal name was Henri. He was the son of a Frenchman, Pierre Conscience, from Besançon, who had been chef de tirermonie in the navy of Napoleon, and who was appointed under-harbourmaster at Antwerp in 1811, when that city formed part of France. Hendrik's mother was a Fleming, Cornelia Baiieu. When, in 1815, the French abandoned Antwerp after the Congress of Vienna, they left Pierre Conscience behind them. He was a very eccentric person, and he took up the business of buying and breaking-up worn-out vessels, of which the port of Antwerp was full after the peace. The child grew up in an old shop stocked with marine stores, to which the father afterwards added a collection of unsaleable books; among them were old romances which he used to tell in Flemish, and the boy and his younger brother were so attached to their grim and somewhat sinister father. In 1825 Pierre Conscience married again, this time a widow much younger than himself, Anna Catherina Bogaerts. Hendrik had long before this developed an insatiable passion for reading, and revelled all day long among the ancient, torn and dusty tomes which passed through the garret of "The Green Corner" on their way to destruction. Soon after his second marriage Pierre took a violent dislike to the town, sold the shop, and retired to that Kempen or Campine which Hendrik Conscience so often describes in his books—the desolate flat land that stretches between Antwerp and Venloo. Here Pierre bought a little farm, with a great garden round it, and here, while their father was buying ships in distant havens, the boys would spend weeks, and even months, with no companion but their stepmother.

At the age of seventeen Hendrik left the paternal house in Kempen to become a tutor in Antwerp, and to prosecute his studies, which were soon broken in upon by the revolution of 1830. He volunteered as a private in the new Belgian army, and served in barracks at Venlo, and afterwards at Dendermonde, until 1837, when he retired with the grade of sergeant-major. Thrown into this way with Flemings of every class, and made a close observer of their mental habits, the young man formed the idea of writing in the despised idiom of the country,
an idiom which was then considered too vulgar to be spoken, and much less written in, by educated Belgians. Although, close by across the Scheldt, the Dutch possessed a rich and honoured literature, many centuries old, written in a language scarcely to be distinguished from Flemish, a foolish prejudice denied recognition to the language of the Flemish provinces of Belgium. As a matter of fact, nothing had been written in it for many years, when the separation in 1831 served to make the chasm between the nations and the languages one which could never be bridged over. It was therefore with the foresight of a prophet that Conscience wrote, in 1830 itself, "I do not know how it is, but I confess I find in the real Flemish something indescribably romantic, mysterious, profound, energetic, even savage. If I ever gain the power to write, I shall throw myself head over ears into Flemish composition." His poems, however, written while he was a soldier, were all in French. He received no pension when he was discharged, and going back idle to his father's house, he determined to do the impossible, and write a Flemish book for sale. A passage in Guicciardini fired his fancy, and straightway he wrote off that series of scenes in the War of Denmark, 1643-45, which lives in Belgian literature under the title of Inti's Wonderjaar 1566; this was published in 1837. His father thought it so vulgar of his son to write a book in Flemish that he turned him out of doors, and the celebrated novelist of the future started for Antwerp, with a fortune which was strictly confined to two francs and a bundle of clothes. An old schoolfellow found him in the street and took him to his home; and soon various people of position, amongst them the eminent painter, Wappers, interested themselves in the brilliant and unfortunate young man. Wappers even gave him a suit of clothes, and presented him to the king, who expressed a wish, which was not immediately carried out in consequence of some red tape, that the Wonderjaar should be added to the library of every Belgian school. But it was under the patronage of Leopold I that Conscience published his second work, Fantasy, in the same year, 1837. A small appointment in the provincial archives relieved him from the actual pressure of want, and in 1838 he made his first great success with the historical romance called The Lion of Flanders, which still holds its place as one of his masterpieces. To this followed How to become a Painter (1841), What a Mother can Suffer (1842), Sixtus I, Romanised (1844), Lambrecht Hensmans (1847), Jacob van Artenwede (1849), and The Conscript (1850). During these years he lived a variegated existence, for some thirteen months actually as an undertaker in a country house, but finally as secretary to the Academy of Fine Arts in Antwerp. It was long before the sale of his books, greatly praised but seldom bought, made him in any degree independent. His ideas, however, began to be generally accepted. At a Flemish congress which met at Ghent so early as 1841, the writings of Conscience were mentioned as the seed which was most likely to yield a crop of national literature. Accordingly the patriotic party undertook to encourage their circulation, and each fresh contribution from the pen of Conscience was welcomed as an honour to Belgium. In 1845 Conscience was made a knight of the Order of Leopold. To write in Flemish had now ceased to be regarded as a proof of vulgarity; on the contrary, the tongue of the common people became almost fashionable, and Flemish literature began to live. In 1845 Conscience published a History of Flanders, which he had wished to return to those exquisite pictures of Flemish home-life which must always form the most valuable portion of his repertory. He was now at the height of his genius, and Blind Rosa (1850), Rikketikketak (1851), The Decayed Gentleman (1851), and The Miser (1853) rank among the most important of the long list of his novels. These had an instant effect upon contemporary fiction, and Conscience had many imitators. Nevertheless, not one of the latter has approached Conscience in popularity, or has deserved to approach him. In 1855 the earliest translations of his tales began to appear in English, French, German and Italian, and his fame became universal. In 1867 the post of keeper of the Royal Belgian museums was created, and this important sinecure was given to Conscience. He continued to produce novels with great regularity, and his separate publications amounted at last to nearly eighty in number. He was now the most eminent of the citizens of Antwerp, and his seventieth birthday was celebrated by public festivities. After a long illness he died, in his house in Antwerp, on the roth of September 1881; he was awarded a public funeral.

The portraits of Conscience present to us a countenance rather French than Flemish in type, with long smooth hair, contemplative dark eyes under heavy brows, a pointed nose, and a humorous broad mouth; in late life he wore the ornament of a long white beard. Whether the historical romances of Conscience will retain the enormous popularity which they have enjoyed is much less than certain, but far more likely to live are the novels in which he undertook to be the genre-painter of the life of his own day. In spite of too rhetorical a use of soliloquizing, and of a key of sentiment often pitched too high for modern taste, the stories of Conscience are animated by a real spirit of genius, mildly lurid, perhaps, rather than startlingly brilliant. Whatever glories may be in store for the literature of Flanders, Conscience is always sure of a distinguished place as its forerunner and father.

**CONSCIENCE** (Lat. con-scientia, literally "knowledge of a thing shared with another person" or "complete knowledge," and derivatively "consciousness" in general), a philosophical term used both popularly and technically in many different senses for that mental faculty which decides between right and wrong. In popular usage "conscience" is generally understood to give intuitively authoritative decisions as regards the moral quality of single actions; this usage implicitly assumes that every action has an objective or intrinsic goodness or badness, which "conscience" may be said to discern much in the same way as the eye sees or the ear hear. Moralists generally, however, are agreed that in all moral judgments of this character there is an implied reference to moral laws, the validity of which is in some ethical systems the true subject matter of conscience. The part played by conscience in relation to general moral laws and particular cases will vary according to the view taken of the character of the general laws. If, on what is called the "jural" theory, these laws are regarded as deriving their authority from the laws of God, then the concept of conscience is so far limited. It may be held to recognize the validity of divine laws, for example; or it may be confined to the deductive process of applying those laws to particular cases, known as "cases of conscience" (see CASUISTRY). If, on the other hand, the general laws are regarded as intuitive, then the discernment of them may be taken as the true function of conscience. In either theory, conscience may be understood as the active principle in the soul which, in face of two alternatives, tells a man that he ought to select the one which is in conformity with the moral law. Apart from the two functions of discerning between right and wrong, and actively predisposing the agent to moral action, conscience has further a retrospective action whereby remorse falls upon the man who recognizes that he has broken a moral law. See ETHICS; also BUTLER, JOSEPH; and compare the "moral sense" doctrine of Shaftesbury.

There are certain special uses of the word "conscience." A **Conscience clause** is the term given to a special provision often inserted in an English act of parliament to enable persons having religious scruples to4 absolve themselves from certain services, or to abstain from certain duties, otherwise prescribed by the act. Conscience money is the name given to a payment voluntarily made by a person who has evaded his obligations, especially in respect of taxes and the like. This usage derives from the last function of conscience mentioned above. **Conscience Courts** were local courts, established by acts of parliament in London and various provincial towns, for the recovery of small debts, usually sums under £5. They were superseded by county courts (q.v.).

**CONSCRIPTION** (from Lat. con-, together, and scribere, to write), the selection, by lot or otherwise, of a proportion of the men of military age for compulsory service in the naval and
military forces of their country; or, more widely, compulsory military service in any form. For a discussion of the military features of conscription and of other forms of recruiting see Army, §§ 40 ff. The present article deals with the economic and social aspects of compulsory military service, for which, generally and non-technically, the word "conscription" is used more commonly than any other. The word occurs for the first time in France in the law of the 9th Fructidor (1798), which prescribes the liability of les défenseurs conscrits to serve if required from their twentieth to twenty-fifth year of age.

There is perhaps no law on the statute-books of any nation which has exercised and is destined in the future to exercise a far-reaching influence on the future of humanity than this little-known French act of 1798, introduced by General Jourdan to the Council of the Five Hundred, for it was the power thus conferred upon the French government which alone rendered the Napoleonic policy of conquest possible. "I can afford to expend thirty thousand men a month"; this boast of Napoleon's, made to Metternich at Schönbrunn in 1805, has determined the trend of events from that day forward, not only on the battlefield, but also in the workshops, and forms even at the present day the guarantee for peace, stability and economic development upon the continent of Europe.

The idea in itself was not new. The principle that every able-bodied male is liable to be called on for defence of the state dates from the earliest times. The essential importance of the event lies in this, that at a critical moment this law passed by an obscure body of men—absolutely in defiance of the opinion of the greatest reformer that France at that moment had discovered, Carnot, and of the feelings of a very large proportion of the whole community—became permanent by the action of causes set in motion by Napoleon, which ultimately compelled all Europe to adopt similar legislation.

To understand its full significance we must trace the line of evolution of the then existing armies of Europe.

In almost any state, in proportion as the central executive power prevailed over internal disturbance, the able-bodied males of each country ceased to have opportunities and incentives for training themselves to arms. Trade became more profitable than plunder, and men began to specialize in various directions. Wealth began to accumulate and fortresses sprang into existence for it. The common guarantee for peace, stability and economic development was the army. Militia forces (corresponding to the former feudal levies) neither could find the specialized labour nor would afford the time, hence the necessity arose of enlisting men who had made the use of arms their special study and were content to abide by the rules of conduct their maintenance as organized bodies imposed. But wherever Europe happened to enjoy a few years of peace, the supply of men who had trained themselves to arms naturally decreased, and the state itself was compelled to assume the task of training its recruits. This, with the exceedingly complicated nature of the weapons in use, was a very long process, and though in the 16th century the idea of universal service was put forward by such statesmen as Machiavelli and Maurice of Nassau, practically it could not be put into force, because in the time the male population could economically give to their training, satisfactory results could not be obtained.

As Motley has pointed out in his Rise of the Dutch Republic, in the time of Alva 5000 disciplined Spaniards were a match for 20,000 and more burghers, though the latter were fighting with the courage, desperation, and by necessity more or less driven to the horrors of warfare. But with the steady improvement in the nature of hand firearms this ratio of superiority of the trained soldiers tended to disappear, whilst as campaigns became fewer and shorter the difficulty of obtaining war-trained soldiers, accustomed to fighting as the Spaniards had been, always increased.

Moreover, after the peace of Westphalia—the close of the great era of religious wars—wars were made for dynastic reasons and primarily for the acquisition of territory; and since the territory was of no use without inhabitants to pay revenue, the "principle of moderation was introduced into the conduct of hostilities, altogether foreign to their nature" (Clauswitz). Men were no longer allowed to live at free quarters or to pillage towns. On the contrary, even in an enemy's country, they had to submit to the severest restraints, and thus soldiering, being no longer remunerative, ceased to attract the more daring spirits.

Thus in the decade preceding the French Revolution soldiering had reached the very nadir of degradation all over Europe, and, though the Prussians, for instance, still retained a great relative superiority in fighting in closed bodies under the eyes of their leaders, the spirit which had led them to victory when fighting in and for their own country had entirely disappeared from their ranks when they had to face the French in their great struggle for existence.

Amongst the earliest problems of the French Revolution was the question of army reform, and compulsory service was at once proposed, and though for the time the opposition of most of the principal soldiers prevailed, ultimately a proposal was accepted by which voluntary enlistment was retained for the line, all unmarried citizens between eighteen and forty years of age constituted the militia, and the rest of the men the national guards for home defence.

The latter proved so popular that over 2,571,000 names were obtained. At once the militia was given up, and reliance was placed upon national guards which was called upon to furnish 160 battalions of volunteers. The result was disappointing. Only 60 incomplete battalions were furnished, and these (except for the few hundreds of enthusiasts amongst them from whom came many of the marshals, generals and colonels of the empire) were recruited from the least trustworthy sections of the community. These were the celebrated Volontaires and proved a positive scourge wherever they were quartered. It was clear that they could not meet the invaders, and the assembly decreed on the 11th of July 1792 "La patrie en danger," and ordered every able-bodied man to consider himself liable for active service, but left it to the communes and districts to select representatives to proceed to the front. These men were called Fédérés, and seem to have been principally those whom the communes desired to get rid of.

But, though the idea of compulsion was present, the means of enforcing the law at the time were so imperfect that the result of this effort was only 60,000 men, of whom not more than half ever reached the field armies. Further, the law had already been found so unsuited to its task that it was amended. But the idea of war was considered to terminate when winter quarters were taken up. In December, therefore, most of the men raised during the year took their discharge, and with the new year the work had to begin all over again. To fill the gaps caused by this sudden defection, and in view of the addition of Great Britain to the list of their enemies, the Convention decreed on the 20th of February 1793 a fresh compulsory levy of 500,000 men. Quotas were assigned to each department and commune, and three days' grace was allowed to each to find their contingents by volunteering; failing this recourse was had to compulsion, all unmarried national guards between the ages of eighteen and forty being held liable. Thereupon thousands fled from their homes, and Vendée (q.v.) rose in open revolt.

Then on the 18th of March came the disaster of Neerwinden, and again the danger of invasion loomed near. In this emergency the Committee of Public Safety replaced the existing recruiting agents by special commissioners with unlimited power, and these ruthlessly hunted down those who attempted to evade their service. But the war was declared inadequate, due, indeed, to the dangers arising from the fall of Valenciennes and Condé. The Jacobins appeared before the Convention on the 12th of August and demanded the Lente en masse, and, using the popular outcry as a fulcrum, Carnot at length succeeded in introducing a workable scheme of compulsion, which limited the liability to service to all able-bodied men between eighteen and twenty-five, but within these limits allowed no exemptions. This became law on the 23rd of August, and it at once began to operate satis-
CONSCRIPTION

factorily, because it was limited to a class who were neither sufficiently numerous, nor sufficiently important politically, to resist coercion. Meanwhile other factors had intervened to render military service more popular. Famine was spreading, political persecution was at its highest, and the ranks of the army became almost the only refuge where men could escape the terrors of secret denunciation. Moreover, experience in the Netherlands and the Palatinate had shown that men could live very comfortably at their enemy’s expense. All these causes combined made an immense increase in the yield of the new law, and, according to the careful estimate of the Duc d’Aumale (1867), by the 1st of January 1794 there were no less than 770,000 men under arms and available for active service. The tide of success in the north of France now definitely turned against the Allies, for they were powerless against the mobility and numbers produced by hunger and political terrorism. Bonaparte’s successes of 1796 were the highest expression of the “new French” method thus developed.

But with the respite which his victories in Italy immediately secured, a reaction against the severity of the conscription soon made itself felt, and the obvious need for internal development gave the discontented a lever for extorting concessions from the government.

To the political economists of the period it seemed a deliberate waste of productive energy to take the young merchant or clerk from his work and force a musket into his hands, whilst other men already trained were willing to renew their contract to defend the state. To regulate this question and also to define more clearly the obligations of the citizen, Jourdan introduced before the Five Hundred a report calling for a reorganization of the army. This ultimately, in the autumn of 1798, became the law of the country and remained practically unaltered as the basis of the French military organization down to 1870. The law definitely laid down the liability of every able-bodied French citizen to serve from his twentieth to his twenty-fifth year, leaving it to circumstances to determine how many classes or what proportion of each should be called up for service. Finally, after much discussion the right of exemption by payment of a substitute was conceded, and therein lay the germ of the disaster of 1870.

Meanwhile, with the assumption of the imperial title by Napoleon, the era of conquest recommenced, and as each fresh slice of territory was absorbed the French law of conscription was immediately enforced. This still further swelled the numerical preponderance against which the other nations had to contend, and each in turn was compelled to follow the French example. Prussia, however, alone pursued the idea to its logical conclusion, and, in the law of 1808 definitely affirmed the principle of universal service without distinction of class or right of exemption by purchase.

Under the restrictions as to numbers imposed on Prussia by Napoleon after Tilsit, and also as a consequence of exceeding poverty, this law found only partial fulfilment, and voluntary organization had to be called into existence to meet the demand for numbers during the Wars of Liberation; but when after 1815 peace was at length assured, the system came into full operation, and it is to this that Prussia owed her phenomenal recovery from the depths of exhaustion into which the catastrophe of Jena had plunged her.

Army expenditure became the fly-wheel which steadied her disorganized finance. The troops had to be fed, clothed, equipped and housed; and the several occupations and trades involved in these processes gave profitable employment both to intellect, which was required to invent, devise and control, and to capital, which would have shirked the risks attending any but government contracts, and remained in private hands, to the detriment of the reproductive power of the nation.

The compulsory intercourse of all ranks compelled the classes to educate the masses—using the term “education” in its broadest sense. Free book-education itself had been forced on the nation as a military necessity of the moment, for without a certain degree of intellectual development in the recruits it was impossible to make soldiers of them within the short time available. But the practical value and application of the book teaching had, in sheer self-defence, to be imparted by the better-class recruits to their social inferiors, and, in the unconscious exercise of these functions as teachers of one another, all found themselves strengthened in character and universal sympathies.

The intelligence of the men reacted on the officers, who could no longer exercise authority by mere word of command, but were compelled, if they wished to survive, to teach by intelligent methods; and they were compelled to struggle for survival because outside of the army absolute ruin and destitution awaited them.

The duration of service being limited to three years, it followed that each year brought with it an influx of recruits to each battalion beyond the power of a few specialists to cope with. Hence the war-hands, now delegated to the captains and subalterns, thus were compelled to become the teachers as well as the leaders of their men. The results from a military point of view were incalculable.

Perhaps the greatest benefit Prussia derived from her system during the first two generations—i.e. from 1810 to 1860—of its continuance was the insensible fusion which took place between the aristocracy and the people as a consequence of their enforced co-operation in a common task. Freed from the fear of French oppression, the court and the older men of the nobility would have swung back to the full exercise of their old feudal privileges; for as they still retained the bulk of the executive power, all the legal reforms and restrictions initiated by von Stein would have proved but paper safeguards; but the army compelled the opposing classes to understand and appreciate one another better, and the younger generation, living always with the threat of invasion impending over them, learnt by emulation from their seniors, who had led their men in battle, the true secret of command, the art of awakening the higher instincts of the men entrusted to them. If it seems to British readers that their progress was slow and that much remains to be accomplished, their starting-point at the outbreak of the French Revolution must be recalled and contrasted with that of the British army; indeed, we must go back to the time of Henry VII. to find a fair parallel.

It must be remembered too that we are speaking of Prussia only. In the other states of Germany which retained conscription with paid substitutes progress was far slower. The whole of Bavaria, Württemberg, and the districts along the Rhine had been saturated with French socialist theories, and here the task of regeneration fell into other hands, and freedom, of a relative kind, had to be extorted by revolutionary means. To these reformers—many of them both devoted and enlightened thinkers—the armies of their own little states necessarily appeared as merely authorized oppressors of the people; and they may well be pardoned for failing to appreciate the essential differences involved in the two systems.

As the years went by, the Prussian military machine was turning out year by year an ever-increasing number of men, who by reason of the physical and moral training they had undergone were head and shoulders above the class whence they had sprung. These men soon asserted their superiority in the labour market and drove their weaker comrades to the wall. The men thus displaced, being obviously less fitted to maintain wives and families, found themselves supplanted by their stronger rivals in the affections of the women, and jealousy being thus evoked, they became as it were a nidus for revolutionary bacilli. This partly explains the temporary recrudescence of revolutionary tendencies during the ’forties and ’fifties. But the growing wealth-producing power of the nation, due to the higher average physique and power of concentration (the consequence of the military training), began to attract the attention of capitalists, and an era of railway construction set in, distributing wealth and employment about the country. This for a time relieved the congestion of the labour market, and, long before the victories of 1866 and 1870 had definitely removed the
last fears of invasion, industries were beginning to spring up around the great trading centres of Germany.

With the treaty of Frankfurt the last fears of the investors vanished, and capital, hitherto dammed back by the uncertainty of land tenure, particularly in the Rhine districts, literally poured into the country, inducing an era of expansion and prosperity for which one can hardly find a parallel, even in America.

That such a period of evolution should have been attended by fluctuations lies in the nature of things. Men accustomed to deal only in hundreds find it difficult to adapt themselves to the business methods requisite to deal securely with millions, and there have been many severe crises due to over-production and speculation, which displaced large masses of workmen and brought misery to thousands of homes.

The remarkable increase of population, the direct consequence of the broader understanding of elementary hygienic principles instilled into the men during their service with the colours, brought a fresh complication into the problem. The strength of the army being definitely fixed by financial considerations, the proportion of men taken for service to the total number annually becoming liable fell off, during the 'eighties, to a very marked degree, and the men who escaped service, being as a consequence of their want of training less fitted for employment in the appeals to the industries, which had turned to swell the ranks of the unemployed and thus afforded fresh material for the socialist propagandists to work upon. If the proportion of men escaping service rose materially above one-half of the total yearly contingent of men becoming available for service, the danger lay very near that the socialist vote might soon exceed all other interests put together, thus threatening the stability of all existing institutions. To meet this danger it was determined in 1893 to increase the annual contingent whilst diminishing the duration of colour service, so that approximately two-thirds of the men available should pass through the ranks, being held that the habit of obedience to constituted authority acquired in the army, together with the silent influence which could be exercised on the ex-soldiers and reservists by the sympathy and example of their former commanders of all ranks, formed the best possible guarantee against the undue spread of socialist doctrine. It was never anticipated that all men who had served their two years would become partisans of constituted authority, but only that, whilst all would learn the hopelessness of armed resistance against the force which held control of the solid-drawn cartridges and artillery material, they would recognize the substantial advantages that accrued to them personally from their previous connexion with the services, and would form a solid bulwark against the spread of subversive doctrines.

To realize the whole situation, the attitude of the leading thinkers amongst the statesmen and soldiers of Germany must be borne in mind. Socialism is to them a necessary lever to extort from capital fairer conditions for labour, capital must be fairly dealt with if the labourers' reasonable demands are to be satisfied, and the army is the compensating lever which secures the necessary adjustments. Capital is attracted by the security of tenure ensured by a strong army, and the working classes are encouraged to put forward reasonable demands by the habits of self-respect and the sense of individuality they acquire in the army, whilst the possible danger of any abuse of the offensive power the army embodies is curbed by the fact, well known and utilized by all continental soldiers, that though one may order men on to the battlefield, one cannot guarantee that they will fight when they get there unless the cause is one in which they can freely resign themselves to the instructions of self-conservation in the race itself. It is unfortunate that sufficient attention has not yet been paid to the statistical side of this question, and concrete figures are not forthcoming to demonstrate the material benefits which have flowed from compulsory service.

Briefly, however, it may be pointed out that under modern conditions of industry the greatest national wealth-producing power resides, not as formerly in the technical skill of the individual, which machinery is gradually superseding, but in the power of continuous collective effort of organized bodies, and that physical health and the power of mental concentration are the principal qualities required by the units of such bodies. Now these are the two essential factors which modern methods of military training aim at developing, and these methods in turn evolved naturally from the conditions of service which compulsion introduced. The men who have undergone this training leave the ranks with bodies steeled to resist disease, and minds capable of prolonged concentrated effort. Hence they not only remain capable of work for a considerably longer period of time, but they also do better work throughout the whole time. It has been estimated that on the average the trained German soldier's expectation of life is about five years better than the normal of his own class. Hence altogether about one million men are still alive and doing good work who without such training would be dead and buried; similarly there are in all some seven millions more, all doing better work day for day than they otherwise would have done.

On the whole the armies of the German states absorbed in taxation some 1,000 million sterling from Waterloo (1815) up to 1900; hence if we assume the increment of wealth-producing power due to training as only two shillings a week per man, the net return on the capital invested must be regarded as enormous, not only in the sense of the soldiers' lives saved, but also in the sense that the economic process has been in action in sufficiently indicated by the almost incredible growth in national credit during the same period.

At the close of the Napoleonic wars, German (including Prussian) credit was actually nil, and there was hardly a town or hamlet throughout the area swept over by the French armies that was not paying heavy interest on loans raised to satisfy the rapacity of its conquerors. Many of these loans still remained unliquidated at the close of the 1870 campaign. Yet since then the credit, both of the individual states and of the empire as a whole, has risen to a point rivalling that of Great Britain, in spite of the fact that in geographical position and in material resources the country is by no means favourably situated.

These advantages have followed on the introduction of compulsory service in Germany—not because there is any inherent virtue in the principle of compulsion in itself, but because it happened that, at the moment compulsion became necessary, the idea was exactly adapted to its environment, and the driving forces necessary to ensure its permanency remained in full activity. Primarily there existed an aristocracy numerically insufficient to fill the organism; in the meantime the masses, and poverty compelled this aristocracy to accept the new responsibility. In the second place there was the knowledge of what war really means, sufficiently vivid and fresh in the minds of the masses to induce them to submit to the necessary restraints of military discipline. When these causes were no longer in full activity, there remained, as sufficient incentive to those still in the active phase of their training, the knowledge that the nation at large, and more particularly the women, fully appreciated the sacrifices that all ranks were compelled to make.

In other nations these driving forces have been absent. Thus in Russia the aristocracy was both numerically and intellectually inadequate to the tasks compulsion entailed upon it. But generally it can be seen that the success or failure of the system has been in exact proportion to the degree in which these driving forces have been available. The failure of compulsion if applied in the British Isles would be due to the fact that the principal factor of its success—the knowledge of what war must mean and the risk of immediate invasion—cannot be brought home to the people as long as the military forces retain their predominance. If the navy is adequate to prevent invasion, then compulsion is unnecessary; if it is inadequate, then the only way to make good its inadequacy is to bring home to the electors by a course of partial training the consequences which must ensure if they continue to neglect it.

(F. N. M.)

CONSECRATION (Lat. consecratio, from con and sacer, "to make sacred"), the separating or setting apart of certain persons, animals, things, places and seasons as sacred, so as to hallow and sanctify them in themselves or adapt them to a
religious rôle and purpose. Thus we consecrate a king, a priest, a deacon; a temple or a church and any part of church furniture; we also consecrate water for use in lustrations, bread and wine in the sacrament; a season or day is consecrated, as a feast or fast. We consecrate ourselves either in a ritual act, as of baptism or ordination, vows or monkish initiation; or, without any implication of particular ceremonies, a man is said to consecrate himself to good works or learning.

The above are good senses of the word, but it is also used in the sense of devoting things and persons to destruction; and in this sense it is tantamount to cursing. Holiness is dangerous and may even involve degradation, as in the case of the Burmese para-gyōon or servitor of the pagoda who is by heredity for ever a slave and outcast, unclean of the unclean, with whom none may eat or intermarry, yet ever tending and keeping clean the shrine. Particular sites, rivers, springs, hills, meadows, caves, rocks, trees or groves, are holy and from time immemorial have been so, as the natural homes or haunts of gods or spirits. Here God has appeared to men, and will again. Such sites in the Old Testament were Hebron with its tree, Sinai with its burning bush, Bethel, Shechem, Beersheba, Mount Gerizim. As a rule their initial consecration goes back beyond memory and tradition; we can rarely seize it in the making, as in the case of a Roman pax votiva. We have images of lightening revered like a well (guleus) against profanation, being thenceforth a shrine of Semo Sancus, the god of lightning. In ancient society certain animals, plants, kins, families, were also holy and bound up with the god by blood-ties or otherwise. A priestly kin owned perhaps the spot haunted by the god, and so became holy. Plants and animals were often hallowed as totems (q.v.). Among the Australian natives we catch the consecrating agency at work. Their babies are incarnations of spirits which quitted a bush or rock passed by the mothers at the moment of conception. Each spirit, as it quits its nānjō or natural haunt to enter the mother, drops a churinga, a slab of stone or wood marked with the child's totem and containing its spirit attributes. These are collected and treasured up for ever.

We also catch the god himself at the work of consecration in tales of voices heard from heaven or of birds alighting on favoured heads. In the Tālmud the voice from heaven, called Bath Kol, attested Rabbi Hillel, as he walked in Jericho, to be worthy of the holy spirit's descent and in-dwelling. At his baptism a dove descended upon Jesus, and one quitted Polycarp's body at the moment of his death. In Philo the wild plants swayed and spread like a well (guleus) against profanation, being thenceforth a shrine of Semo Sancus, the god of lightning. In ancient society certain animals, plants, kins, families, were also holy and bound up with the god by blood-ties or otherwise. A priestly kin owned perhaps the spot haunted by the god, and so became holy. Plants and animals were often hallowed as totems (q.v.). Among the Australian natives we catch the consecrating agency at work. Their babies are incarnations of spirits which quitted a bush or rock passed by the mothers at the moment of conception. Each spirit, as it quits its nānjō or natural haunt to enter the mother, drops a churinga, a slab of stone or wood marked with the child's totem and containing its spirit attributes. These are collected and treasured up for ever.

In such cases the holiness or taboo (q.v.) is traditional, or any-how not imparted at a given moment by human intervention. The god has not been constrained or invited to enter in. The Fetish religions afford examples of such constraint or invitation. Spirits capable of being confined in matter and made useful are in various ways sung or coaxed into the tenements prepared for them. Thus a West African native who wants a suhman takes a rudely-cut wooden image or a stone, a root of a plant, or some red earth placed in a pan, and then he calls on a spirit of Sasa-bonsum (a genus of deities, every member of which possesses identical characteristics of a deity, which, when in its active state, inhabit a certain region) to come and take possession of the image or stone placed there to receive it offerings and worship. If a spirit consents to take up its residence in the object, a low hissing sound is heard, and the suhman is complete. It receives a small portion of the daily food of its owner, and is treated with reverence, and mainly used to bring evil on some one else.1 This is a typical case of a human consecration. Invocation of a name, with sacrifice and anointing, consecrated the Semitic massebas or nosbs,—eclips pillars of stone

in which the god really lived, and which were no mere images or symbols of him. Two such still remain hard by the ruins of the royal sanctuary of Edom, overlooking Petra, and are obelisks in form, 18 ft. high. They were usually set up under a holy tree to commemorate a divine epiphany and were mostly unwrought (Exod. xx. 25), lest the hand of human craftsmen should introduce another nomen or divine power than what the votaries wished to tenant them. The consecration consisted of a smearing with fat of victims or with oil of vegetable offering (Gen. xxviii. 18), and the life or soul inherent in these passed into the stone. Such stones were familiar objects in the streets of an old Greek city, where Theophrastus (Characters, ch. 16) saw the "super-stitious" man, as he passed by, take out his phial of oil, pour it over them, and kneel down before them to say his prayers. In a street of Benares similar devotions meet the eye, as dainty maidens pour out phials of holy water over erect stones of the same obscure pattern that was common also in Greece and Italy. The Semitic word for a stone tenanted by the nomen was Beth-el, house of god, in Greek Bairelos. It was often small and portable, and known as a "stone ensouled." Such stone pillars were usually two in number, as in Solomon's temple (1 Kings vii. 15, 21) or in Melkarth's shrine at Tyre, described by Herodotus (iv. 44). Sometimes twelve stood together, e.g. in Jos. iv. 20 and Exod. xxiv. 4, which passages may have suggested that Armenian and other Semites' stone pillars in the street were a mirror of the transition from a stonehenge to a church building. The bishop and clergy choose a suitable spot, and erect twelve large stones unwrought and unpolished around the central rock of the altar, and on these the walls of the church are laid. In Armenia and the Caucasus the cult of such sacred trees and pillars passed without break into that of the cross, which was hallowed as follows. By popular preference made of the wood of a sacred tree, it was brought into church, and washed first with water and then with wine, or anciently perhaps with blood of a victim. The people pray "for the sending of the grace of the Holy Spirit into this image of the holy cross; the priest that God will "send the grace of His all-powerful and uplifted arm" into the holy oil, with which he then makes the sign of the cross first on the eye and afterwards on the four wings of the cross, saying: "May this cross be blessed, anointed and hallowed in the name of Father and Son and Holy Spirit." Then he lays his right hand on it and ordains it, with the prayer: "Lay, O Lord, Thy holy hand upon this emblem of the cross and bless it:" The people kiss the cross and bow down to it; and ever after Christ's spirit is enshrined in the holy vessels, drives off demons, and wards off wind and hail. Animal victims are sacrificed before it, on old feast-days before the sacred pole or pillar, and it is worshipped and adored. He that dies in defence of it is a holy martyr. Thus Christ oozed in the stocks and stones the old evil spirits that tenanted them, and took their place. Among the Greeks cruciform shape sufficed of itself to hallow wood or stone.

In Hinduisim the various implements of sacrifice are similarly personified and worshipped, especially the sacrificial post to which the victim is bound, and which, under the name of vanaspati and svaru, is defied and invoked. It is a survival of tree-worship and comparative to the Semitic ashera. The Rigveda (3, 8) describes it as a tree well lopped with axe, anointed and adored by the priest. Such a post set up by the priests is a god, is thrice anointed with ghee (or holy butter), and being set up beside the fire is invoked to let the offering go up to the gods.2 It is not always easy to mark off consecration from inspiration. Thus in New Zealand "a priest by repeating charms can cause the spirit to enter into the idol . . . it is the same atua or spirit which will at times enter not the image but the priest himself, throw him into convulsions and deliver oracles through him." It is, however, best to restrict the term "consecration" to cases where the spirit falls on a person, not automatically or unexpectedly, but by invitation, in response to prayer, through laying-on of hands and greasing, after a formal fast, continence, ritual.

washing, and so forth. Thus in 1 Sam. x., Samuel ordaining Saul "took the vial of oil and poured it upon his head and kissed him," and some afterwards "God gave Saul another heart"; so that when he met the band of prophets the contagion flew from them to him, "and the spirit of God came mightily upon him, and he prophesied among them."

The recognized modes of communicating the afflatus, power or numen to a person or thing to be consecrated are many, and only a few can be enumerated. (1) Blowing. The risen Jesus (John xx. 22) breathed on his disciples and said, "Receive ye the Holy Ghost." The Roman priest, in consecrating the water of baptism, blows over it and signs it twice with the cross. He also begins the rite of baptism by blowing in the catechumen's face. In the rite of laying hands on an elect the bishop of the Armenian Paulicians blows three times in the face of the newly ordained. The impure spirit is blown out and the pure blown in. (2) Laying-on of hands. The particular persons whose virtue is to be transmitted lay their hands on the head or shoulders of the consecrator, e.g. three bishops in episcopal consecration. (3) Branding or signing the person, especially on the forehead, with the sacred emblem. So a Hindoo paints his caste emblem on his forehead, and a fugitive slave in ancient Egypt, once marked with sacred stigmata in a temple, could not be reclaimed by the master. He belonged to the god. Roman recruits when they took the sacrament, or oath of fealty, were tattooed with the "sign" or "seal." So in Christian initiations the sign of the cross is made on the brow, and in Revelation the redeemed are so marked. Mexican peasants regularly paint or tattoo a cross on their foreheads, and the old Armenian equivalent for destiny or fate is ekaatogir or forehead-writing. An inanimate object is similarly consecrated. The "soldiers" of Mithras, says Tertullian, were signed or sealed on their foreheads. (4) Use of a name. The invocation of a powerful name over a thing or person brings him or it within its sphere of influence, and actually communicates thereto the divine or supernatural power of the person of the one named.

Amulets, seals, talismans, relics, ear or nose rings stamped with divine emblems or otherwise hallowed, communicate their holiness to the wearers and protect from the Adversary. Personal ornaments and decorations of dwellings, furniture, vehicles and pottery had once a consecrating, or—what often comes to the same thing—a prophylactic value and significance. Mutations, such as circumcision, violation of chastity in the case of maidens hallowed to certain gods, ritual cutting of hair and nails, and their deposition in a sanctuary, rather belong to the category of sacrifice, as also the burial of a living victim under the foundations of a new building or bridge (see SACRIFICE). Cursing, is, equally with consecration, a taboo imposed on a thing or person. It may be noted in consecration how nicely the taboo or contagion, whether of holiness or unholiness, can be localized. An Arab's curse is escaped by falling flat on the face, for it then shoots over the head only. The following custom was referred to as French-Canadian before the judicial committee of the private council. A man buried his wife in a plot he had bought in a Catholic cemetery. Presently he died also, but without the sacraments, for he had changed his religion. His executors ignored the protests of the Catholic clergy and buried him in the same grave. Ultimately the bishop of Quebec, unable to get a mandamus from the English privy council to dig him up, solemnly deconsecrated the ground down to the estimated depth of the lid of the wife's coffin. The use of specially consecrating cemeteries among Christians is first mentioned by Gregory of Tours (c. 570); but under the Roman law they had, like those of the Pagans, been held inviolable by pagan emperors like Gordian and Julian and defined as "res religiis destinatae quin immo (iam) religionis effectae." (Cod. Justin., lib. ix. tit. 19).

Lastly, a classical mode of consecrating persons, or winning or reinforcing their holiness or kinship with the god, is the sacrificial meal at which sacred animals or the god himself are eaten. (See SACRAMENT and SACRIFICE.) Consecration is so frequently the counterpart of purification that the article thereon should be read in connexion with this. For the consecration of bishops, see BISHOP; for that of churches, see DEDICATION.

CONSEIL DE FAMILLE ("family council"), in France, an institution for the protection of the interests of minors. By the Code Civil (art. 407-410) it is composed of seven members. The local justice of the peace (juges de paix) is the presiding officer. The other six members must be relations of the minor, chosen from the mother's and father's side of the family respectively (three on each side). The Code gives in minute detail rules for choosing these relations. Meetings of the family council are held in private, five of the members constituting a quorum. The council has power to appoint a guardian to the minor; to authorize marriage or oppose it; to audit the accounts and decide questions concerning the minor's estate. The French family council is founded on the Roman law of tutelage, and has a long and useful history.

CONSERVATIVE PARTY, in Great Britain, the name of the successors of the Tories (see Whig and Tory) as one of the great political parties, representing the opposition to the Liberal party (q.v.), championing stability rather than innovation, or the advantages of preserving inherited conditions so far as possible rather than adopting changes which are founded on theoretical ideals. J. W. Croker, in an article in Quarterly Review (vol. 5, Jan. 1830) has a more appropriate than "Tory," but for some time it was only used sporadically, and many of the old Tory régime disliked it. The term "Tory" has in fact never quite fallen out of use, and has been commonly retained by many modern Conservatives who wish to emphasize that theirs is a constructive and positive policy of constitutional as opposed to radical reform, and not merely one of letting things remain simply "as they are." Similarly attempts were made in the 'eighties to substitute "Consitutionalist," but without its becoming current coin; and Lord Randolph Churchill called himself a "Tory democrat."

Sir Robert Peel, in a speech in the House of Commons, protested against the "un-English name of Conservative." Yet Peel himself shotted the old Tory and Protectionist party in 1846, and soon after called himself a Conservative, and the Peels were commonly spoken of as Liberal Conservatives. And "Conservative" came into regular use for the party, "Conservative" became the recognized term for its opposite, Toryism being popularly regarded as the reactionary creed of the supporters of "vested interests" and opponents of reform of any kind. The character of any British Conservative party, in the widest sense of the term, has naturally changed, and was bound continually to change, with the progress of events. The successive Reform Acts, which put political power into the hands of new classes of the electorate, made it necessary to make a new sort of appeal to them, in order to support the causes of the church establishment, the House of Lords, and the main features of the constitution. The history of this movement cannot be summarized here, but the salient details may be found in the biographical articles on such leading Conservative statesmen as Lord Beaconsfield, Lord Salisbury and Mr A. J. Balfour (qq.v.). In organization the party followed much on the lines of the Liberal party, J. W. Croker in an article in Quarterly Review (vol. 5, Jan. 1830) as "Consitutional" or "Conservative" multiplied throughout the country; and a "National Union of Conservative and Constitutional Associations" formed a federation in 1867, in alliance with the work of the Central Conservative Office under the party whips. It was, however, unlike the similar
"National Liberal Federation," under the control of influential people who were loyal to the Central Office. In this respect the Conservative party, as an internally loyal party, had some advantage in organization; and such independent outbreaks as that of the "Fourth Party" (in the parliament of 1860), while stimulating to the Central Office, may be said to have applied a useful massage rather than to have led to any breaking of bones; while the Primrose League and similar new bodies acted as co-operating agencies. Mr Gladstone's proposal of Home Rule for Ireland in 1886 resulted in a great accession of strength to the party, owing to the splitting off of the Liberal Unionists from the Liberal party. From this time the term "Unionists" began to come into use, to signify both the Conservative and the Liberal Unionist parties; the distinction between the two wings gradually grew smaller; and by degrees the name of "Conservative party," though officially maintained, became more and more vague, as politics centred round Ireland, Imperialism or Tariff Reform.

See also M. Ostrogorski, Democracy and the Organization of Political Parties (Eng. trans., 1902); T. E. Kebbel, History of Tourism (1886).

CONSERVATOIRE (the Fr. equivalent of Ital. Conservatorio, Ger. Conservatorium, from Med. Lat. conservare, to preserve, to keep safe). The name Conservatoire is generally used not only of the French institutions which to it properly applies, but also of the Italian Conservatorio and the German Conservatorium, and even sometimes of English schools of music. In the United States, however, the anglicized form "Conservatory" is used, a form far more satisfactory from the point of view of linguistic purity, but difficult to establish in England owing to its common application to a particular kind of green-house (see Horticulture). The Italian conservatorios were the earliest, and originated in hospitals for the rearing of foundlings and orphans (whence the name) in which a musical education was given. When fully equipped, each conservatorio had two maestri or principals, one for composition and one for singing, besides professors for the various instruments. Though St Ambrose and Pope Leo I., in the 4th and 5th centuries respectively, are sometimes named in connexion with the subject, the historic continuity of the conservatorio is modern and cannot be traced farther back than the 16th century. The first to which a definite date can be assigned is the Conservatorio di Santa Maria di Loretto, at Naples, founded by Giovanni di Tappia in 1537. Three other similar schools were afterwards established in the city, of which the Conservatorio di Sant' Onofrio deserves special mention on account of the fame of its teachers, such as Alessandro Scarlatti, Leo, Durante and Porpora. There were thus for a considerable time four flourishing conservatorios in Naples. Two of them, however, ceased to exist in the course of the 18th century, and on the French occupation of the city the other two were united by Murat in a new institution under the title Real Collegio di Musica, which admitted pupils of both sexes, the earlier conservatorios having been exclusively for boys. In Venice, on the other hand, there were from an early date four conservatorios conducted on a similar plan to those in Naples, but exclusively for girls. These died out with the decay of the Venetian republic, and the centre of musical instruction for northern Italy was transferred to Milan, where a conservatorio on a large scale was established by Prince Eugène Beauharnais in 1808. The celebrated conservatorio of Paris owes its origin to the École Royale de Chant et de Declamation, founded by Baron de Breteuil in 1784, for the purpose of training singers for the opera. Suspended during the stormy period of the Revolution, its place was taken by the Conservatoire de Musique, established in 1795 on the basis of a school for gratuitous instruction in military music, founded by the mayor of Paris in 1792. The plan and scale on which it was founded had to be modified more than once in succeeding years, but it continued to flourish, and in the interval between 1820 and 1840, under the direction of Cherubini, may be said to have led the van of musical progress in Europe. In more recent years that place of honour belongs decidedly to the Conservatorium at Leipzig, founded by Mendelssohn in 1843, which, for composition and instrumental music, became the chief resort of those who wished to rise to eminence in the art. Of other European conservatorios of the first rank may be named those of Prague, founded in 1810; of Brussels, founded in 1833 and long presided over by the celebrated Fétis; of Cologne, founded in 1849; and those instituted more recently at Munich and Berlin, the instrumental school in the latter long enjoying the direction of Joachim. In England the functions of a conservatoire have been discharged by the Royal Academy of Music of London, founded in 1822, which received a charter of incorporation in 1830, the Royal College of Music (1882), the Guildhall school, and similar institutions. The chief public institution for teaching music in the United States is the National Conservatory of Music of America, founded in New York in 1885. The famous Dvořák was for a time its director. Other well-known American establishments are the Peabody Conservatory in Baltimore (1868), the Cincinnati College of Music (1878), and the New England Conservatory of Music in Boston (1867).

CONSERVATOR (Lat. conservare, to preserve), one who preserves from injury, a guardian or custodian. In the middle ages the title of conservator was given to various officers such as those appointed by the council of Würzburg in 1287 to protect the privileges of certain religious persons, the guardians of academic rights in the university of Paris, certain Roman magistrates as late as the 16th century, or the conservator judaeorum who was enjoined to look after the Jews of the county of Provence in 1424. By the 2 Henry V. there was appointed a conservator of truce and safe conducts in each English seaport "to enquire of all offences done against the king's truce and safe conducts, upon the main sea, out of the liberties of the five ports." In Scotland the conservator of the realm (c. 1553) had jurisdiction to settle the disputes and protect the rights of Scottish merchants in foreign ports or places of trade. In England the conservators of the peace (custodes pacis) were the precursors of the modern justices of the peace. Stubbs traces their origin to the assignment of knights, in 1195, to enforce the oath to preserve the peace which Richard I. ordered to be taken by all persons above the age of 15. By the 1 Edward III. conservators of peace were appointed for each county to guard the peace and to bear and determine feoffes. The office was reconstituted by the parliament of 1327, and its powers were extended in 1360. From the sovereign and the lord chancellor down to the justices and the village constable, all who have to do with the repression of crime are included within the general term of conservators of the peace. As commonly used nowadays in England, the term conservator is applied only to the guardian of a museum or of a river (see Thames).

CONSETT, an urban district in the north-western parliamentary division of Durham, England, 20 m. S.E. of Newcastle-upon-Tyne by a branch of the North Eastern railway. Pop. (1901) 9694. It is the centre of a populous industrial district. At Shotley Bridge (where there is a small spa) a colony of German metal-workers, making swords and knives, was established in the 17th century; but this industry has now been replaced by paper mills. There are extensive collieries and ironworks in the district.

CONSHOHOCKEN, a borough of Montgomery county, Pennsylvania, U.S.A., on the Schuylkill river, 12 m. N.W. of Philadelphia. Pop. (1890) 5470; (1900) 5762 (52.6 being foreign-born); (1910) 7480. It is served by the Pennsylvania and the Philadelphia & Reading railways. The borough is built on land which rises gradually from the river-bank for about 1 1/2 m. and then becomes quite level, but the surrounding country is for the most part occupied by hills, several of which rise to considerable height. It has a variety of manufacturing establishments, among which are cotton and woolen mills, rolling mills, steel mills, foundries, boiler shops, tube works, and works for making surgical instruments and artificial stone. The place was first settled about 1820, and was for several years known as Matson's Ford; in 1830 it was laid out as a town and received its present name, an
Indian word meaning "pleasant valley." It was incorporated in 1850. Immediately across the Schuykill is West Conshohocken (pop. in 1900, 1958), where carpets and woolen goods are manufactured.

CONSIDÉRANT, VICTOR PROSPER (1808–1893). French socialist, was born at Salins (Jura) on the 12th of October 1808. Educated at the École Polytéchnique in Paris, hence to the French army as an engineer, rising to the rank of captain. Becoming imbued, however, with the phalansterian ideas of François Fourier, he resigned his commission in 1831, in order to devote himself to advancing the doctrines of his master. On the death of Fourier in 1837 he became the acknowledged head of the movement, and took charge of La Phalange, the organ of Fourierism. He also established phalanges at Condé-sur-Vesgres and elsewhere, but they had little success and soon died of inanition. During this period he published his Destinée sociale (1834–1838), undoubtedly the most able and most important work of the Fourieristic school. After the revolution of 1848 he was elected to the Constituent Assembly for the department of Loiret, and in 1849 to the Legislative Assembly for the department of the Seine. Considerant's share in the "demonstration" under the leadership of Ledru-Rollin on the 13th of June 1849 caused his compulsory flight to Belgium. Thence he went (1850) to Spain, but soon returned, and offered himself for a short imprisonment for alleged conspiracy against the peace of a neighbouring state. On his release he again set out for Texas, and founded at San Antonio the communist colony of La Réunion. This experiment met with little more success than his former attempts, and in 1869 he returned to Paris, where he lived in retirement, needy and forgotten, till his death in 1893.

The most important of Considerant's other writings were Exposition du système de Fourier (1845), Principes du socialisme (1847), Théorie du droit de propriété et du droit de travail (1848).

CONSIDERATION (from Lat. considerare, to look at closely, examine, generally taken to be from con-, and the base seen in sidus, sideris, a star, the word being supposed to be originally an astrological or astronomical term), observation, attention, regard or taking into account, hence the fact taken into account, and especially something given as an equivalent or reward or in payment; in the law of contract, an act or forbearance, or the promise thereof, offered by one party to an agreement, and accepted by the other as an inducement to that other's act or promise (Pollock on Contract). Consideration in the legal sense is essential to the validity of every contract unless it is made in writing under seal. The meaning of the word is quite accurately expressed by a phrase used in one of the earliest cases on the subject—it is strictly a quid pro quo. Something, whether it be in the nature of an act or a forbearance, must move from one of the parties in order to support a promise made by the other. A mere promise by A to give something to B cannot be enforced unless there is some consideration "moving from B." While every contract requires a consideration, it is held that the court will not inquire into the adequacy thereof, but it must be of some value in the eye of the law. It must also be legal, and it must be either present or future, not past. See further CONTRACT.

CONSIGNMENT (from consign, Fr. consigner, Lat. consignare, to affix a signum, seal; whence, in Late Lat., to hand over, transport), generally, the delivery or transmission of any person or thing for safe custody, e.g. of a malefactor to prison, or of a horse to the care of a groom. In law, consignment is used of the sending or transmitting of goods to a merchant or factor for sale. The person who consigns the goods is called the consignor, and the person residing at the port of delivery or elsewhere to whom the goods are to be delivered when they arrive there is called the consignee. See further APPREHENSION.

CONSOLOY (Lat. consistitorium, literally, a standing place, hence meeting place, waiting or audience chamber), a term which, like many other expressions, has undergone a regular evolution in the course of centuries. It was first applied to the audience-chamber in which the emperors received petitions and gave judgment; it soon came to mean also the persons who took part in the deliberation, and, by an extension of meaning, a tribunal or jurisdiction (see Du Cange, Glossarium, s.v.). But the expression has now long been exclusively applied to gatherings of ecclesiastical persons for the purpose of administering justice or transacting business.

In the Western Church the episcopal consistory was simply the bishops' tribunal, the proceedings of which took a more or less strictly judicial form. But the name has disappeared almost everywhere; the only episcopal consistories outside England (see Consistory COURTS) which survive are in Austria and in certain dioceses of Bavaria and Germany (see Vering, Kirchenrecht, § 140). Thus the name consistory has come to be applied almost exclusively to meetings of the college of cardinals with the pope as president, formerly for deliberative purposes, but nowadays purely formal. These meetings used to be frequent, but are now held very seldom, taking place only three or four times a year.

The cardinals (q.v.) form the pope's council and senate; before it became the custom to entrust the management of various kinds of business, grouped according to their nature, to commissions composed of cardinals, the pope used to consider and discuss with the whole sacred college matters of general interest or those which were specially referred to him, notably the questions submitted to him by bishops from all parts of Christendom. The number of such matters had become very large, and the cardinals were few in number, consistories were held very often. Thus the Geo\(\text{t}o\) of Innocent III. tell us that this great pope "held publicly, three times a week, according to the usage then established, a solemn consistory; in it he heard complaints from all men, and examined in person even affairs of the least importance with a prudence and perspicacity which were the admiration of all." Later we have recorded only one consistory a week; in the 16th century, according to Cardinal De Luca, it usually took place only twice in a month; and soon the consistories were held at still greater intervals; they were held more or less regularly during the Ember weeks, but now they have no longer a fixed date.

Whatever be their form, they are nowadays merely ceremonial, the business upon which they are supposed to meet being discussed and decided previously; consequently, they are merely a kind of solemn promulgation. The preparation of the business is entrusted to the commission of cardinals known as the Consistorial Congregation.

There are three kinds of consistory: the secret consistory, in which only the cardinals take part; the public consistory, to which are admitted persons from outside and a fairly large audience; and finally, the semi-public consistory, in which the bishops present in Rome take part with the cardinals, and are allowed to state their opinion. The last form is only used in the case of the consistory preceding a canonization. The public consistory is now only held for the ceremony of conferring the hat on newly created cardinals; formerly the popes used to receive in public consistory sovereigns and certain other great persons, but in this case the consistory was not deliberative in form.

Finally, in secret consistories were discussed matters of general interest, such as the creation of cardinals, the provision of cathedral churches and other higher benefices—hence called consistorial,—the creation, union or division of dioceses, the conferring of the pallium (q.v.), and other matters of importance. In these consistories takes place the "preconization" of bishops appointed since the last consistory. The custom is for the pope to open the meeting by a discourse, or "consistorial allocution," in which he deals with the position of the Church, either in general or in some particular country; or again, he may denounce some danger which is threatening at the time either the faith or discipline, or protest against attacks upon the rights of the Church. Such, for example, were the allocutions of Pius IX. against the successive invasions of his temporal domain, or that of Pius X. against the breaking of the Concordat by the French government.

In the consistory, the cardinals are seated in a circle around the pope; on his right sits the chief cardinal bishop, after whom
are placed in order all the others; on the left of the pope stands the chief cardinal deacon; the chief cardinal priest comes next to the last cardinal bishop, and the last cardinal priest next to the last cardinal deacon. As in the old imperial consistorium, the cardinals assemble in the hall of the consistory, and there await the pope, who takes his place upon his throne; in former days he used first to give audience to those cardinals who had to submit certain matters to him, after which the doors were shut and the consistory became secret.

(Δ. Bo.)

CONSIORY COURTS, those ecclesiastical courts wherein the ordinary jurisdiction of the bishop is exercised (see Consistory). They exist in every diocese of England. Consistory courts were established by a charter of William I., which appointed the cognizance of the ecclesiastical causes to the distinct place or court from the temporal. The officer who exercises jurisdiction in a consistory court is known as the chancellor (q.v.), and he is appointed by patent from the bishop or archbishop. All jurisdiction, both contentious and voluntary, is committed to him under two separate offices, those of official principal and vicar-general; the distinction between the two offices is that the official principal usually exercises contentious jurisdiction and the vicar-general voluntary jurisdiction. (In the province of York there is an official principal of the chancery court and a vicar-general of the diocese.) Since about the middle of the 19th century consistory courts have been shorn of much of their importance. Before the year 1858 consistory courts exercised concurrently with the courts of their respective provinces jurisdiction over matrimonial and testamentary matters. This jurisdiction was taken away by the Court of Probate Act 1857 and the Matrimonial Causes Act 1857. They had also corrective jurisdiction over criminal clerks, but this was abrogated by the Church Discipline Act 1840. The principal business of consistory courts is now the dispensing of faculties. The procedure in such is strictly forensic, for all applications for faculties, though they may be unopposed, are commenced by citation, calling on all who may have an interest to oppose. From the consistory courts an appeal lies to the provincial courts, i.e. the arches court of Canterbury and the chancery court of York. Also, by the Clergy Discipline Act 1892, a clergyman may be prosecuted and tried in a consistory court for immoral acts or conduct. Under this act, either party may appeal either to the provincial court or to the king in council against any judgment of a consistory court.

CONSOLATION (Fr. consolation, Lat. consolatio, from consolari, to assuage, comfort, console), in general, the soothing of disappointment or grief. The word is applied equally to the action of consoling, or the state of being consoled, and to the instruments by which comfort is brought. Thus we speak of a person making attempts at consolation, of receiving consolation, and e.g., of the consolations of religion. In the sense of compensation for loss, the word "consolation" has had a variety of adaptations. Of its use in ecclesiastical Latin, in this sense, Du Cange gives various instances. Thus the synod of Angers (453) decreed that clerics "qui sunt caelibus, nonnisi a sororibus aut amatis aut matribus consolentur"; consolatio was also the name given, e.g., to the evening meal given to monks after the regular collation "by way of consolation" and to certain payments made to members of chapters over and above the revenues of their benefices. In an analogous sense we use the word in such combinations as "consolation price," "consolation race," "consolation stakes," meaning such as are open only to competitors who have not won in any preceding "event." Consolation is also the name of a French gambling game, so called because it is usually played on and about races-courses after the races have been run and the players have presumably lost. The necessary implements are a board divided into sections numbered from 1 to 6, upon which the players place their stakes, and a die which is shaken in a box and thrown on the board. The banker, usually a professional gambler, pays five times the money on the winning number and pockets the rest. His chances of winning are overwhelming, as the die is never thrown until a stake has been placed upon all six compartments.

CONSOL (a French form, supposed to be an abbreviation of consolidé, from Lat. consolidare, to strengthen), the architectural term given to a corbel (q.v.) placed on end, i.e. in which the height is greater than the projection. The corbel brackets which carry the cornice of a Roman doorway, and are described by Vitruvius as ancones (see Ancon), are among the best examples. The word is, however, more familiar in its connexion with furniture. The console-table was originally so called because the slab was supported upon a scroll-shaped bracket, or upon legs which in form and contour answered roughly to the idea of a bracket. A console-table has a front and two sides; the back, which remains unornamented, always stands against the wall. Since this piece of furniture was first introduced in the 17th century it has undergone many modifications of form. It has been flat and oblong, oval and bombé; but, save during the Empire period, it has rarely been square. The console-table—the slab of which is often of marble—lends itself with peculiar adaptability to ornament, and, especially during the first half of the 18th century which was its most distinguished and, artistically, its most satisfactory period, it was often of extreme grace and elegance. France was always its natural home, and the Mohler National and the great French palaces still contain many extremely ornate examples, in which fruits and flowers, wreaths and scrolls, gildings and inlays produce gorgeous and yet homogeneous effects. Until the reign of Louis XVI. console-tables were almost invariably gilded, but they then began to be painted usually in gris-perle, and by degrees came to be manufactured in rose-wood and mahogany. Although much used in England the console has never been thoroughly acclimatised there; that it has always retained a foreign character is indicated by the fact that, unlike most other pieces of furniture, it has failed to command itself to any but the richer classes.

CONSOLIDATION ACTS. To "consolidate" (Lat. consolidare, from cons-, together, and solidus, firm) is to press compactly together, put on a firm basis, and especially bring together into one strong whole. The practice of legislating for small portions of a subject only at a time, which is characteristic of the English parliament, produces as a necessary consequence great confusion in the statute law. The acts relating to any subject of importance or difficulty will be found to be scattered over many years, and through the operation of clauses partially repealing or amending former acts, the final sense of the legislature becomes enveloped in unintelligible or contradictory expressions. Where opportunity offers, the law thus expressed in many statutes is sometimes recast in a single statute, called a Consolidation Act. Among such are acts dealing with the customs stamps and stamp duties, public health, weights and measures, sheriffs, coroners, county courts, housing, municipal corporations, libraries, trusts, copyright, diseases of animals, merchant shipping, friendly societies, &c. These observations apply to the public general acts of the legislature. On the other hand, in settling private acts, such as those relating to railway and canal enterprise, the legislature always inserted certain clauses founded on reasons of public policy applicable to the business in question. To avoid the necessity of constantly re-enacting the same principles in private acts, their common clauses were embodied in separate statutes, and their provisions are ordered to be incorporated in any private act of the description mentioned therein. Such are the Lands Clauses Acts, the Companies Clauses Acts and the Railways Clauses Acts.

CONSOLS, an abbreviation of consolidated annuities, a form of British government stock which originated in 1731. Consols formed the larger portion of the funded debt of the United Kingdom. In the progress of the national debt it was deemed expedient, on grounds which have been much questioned, instead of borrowing at various rates of interest, according to the state of the market or the need and credit of the government, to offer
CONSORT—CONSPIRACY

A fixed rate of interest, usually 3 or 3½%, and as the market required to give the lenders an advantage in the principal funded. Thus subscribers of £100 would sometimes receive £350 of 3½% stock. In 1819, at the close of the French wars, a large loan was raised at as much as £174 3½% stock for £100. The low rate of interest was thus purely nominal, while the principal of the debt was increased beyond all due proportion. This practice began in the reign of George II., when some portions of the debt on which the interest had been successfully reduced were consolidated into 3½% annuities, and consols, as the annuities were called, and other stocks of nominally low interest, rapidly increased under the same practice during the great wars. In times of peace, when the rate of money has enabled portions of the debt at a higher interest to be commuted into stock of lower interest, it has usually been into consols that the conversion has been effected. Temporary deficits of the revenue have been covered by an issue of consols; exchequer bills when funded have taken the same form, though not constantly or exclusively; and some government loans for special purposes, such as the relief of the Irish famine and the expenditure in the Crimean and Boer Wars have been wholly or partly raised in consols. The consequence has been to give this stock a presence in the amount of the funded debt. See further under National Debt—United Kingdom.

CONSORT (Lat. consors, a companion), in general, a partner or associate, but more particularly a husband or wife. The word is also used in conjunction with some titles, as “queen consort,” “prince consort.” Under the law of the United Kingdom, the queen consort is a subject, but has certain privileges. By the Treason Act 1351, the compassing and imagining her death is high treason, as is also the commission of adultery with her. With regard to the acquisition and disposal of property, the incurring of rights and liabilities under contract, suing and being sued, a queen consort is regarded as a feme sole (3 Henry VIII. c. 51, 1540; Private Property of the Sovereign Act 1800). The queen consort has her own ceremonial officers and appears in the courts by her attorney and solicitor—general. At one time she had a revenue out of the demesne lands of the crown and a portion of any sum paid by a subject to the king in return for a grant of any office or franchise; this was termed curtum regnum or queen-gold. Provision is now made for the queen consort by statute. When the husband of a queen consort dies she becomes a queen dowager. A queen dowager is not under the protection of the law of treason. It is said (Blackstone, Commentaries) that she cannot marry without the king’s licence, but this is doubtful. A queen regnant, holding the crown in her own right, has all the prerogatives of a sovereign. In the four cases of queens regnant in English history, the husbands’ positions have each been different. When Queen Mary I. married Philip of Spain it was provided by every safeguard that words could suggest that the queen alone should exercise all the powers of the crown; official documents, however, were to issue in their joint names. William III. occupied the throne jointly with his wife, Mary II. The husband of Queen Anne, George of Denmark, who was naturalized by act of parliament in 1689, occupied no definite position, and differed only from other subjects of the queen in the exercise of his naturalization. The position of Prince Albert of Saxe-Coburg-Gotha in the reign of Queen Victoria was somewhat like that of Prince George of Denmark. A few days before his marriage he had been naturalized as a British subject, and immediately after his marriage letters patent were issued, giving him precedence next to the queen. He had, however, no distinctive title, and the privileges and precedence he received were only by courtesy. As the patent which gave him precedence was inoperative outside the United Kingdom, certain difficulties occurred at foreign courts, and in order to settle these, the formal title of “Prince Consort” was conferred upon him by letters patent in 1857.

CONSPIRACY (from Lat. conspiro, literally to breathe together, to agree, combine, and especially to form a secret plot), in English law, an agreement between two or more persons to do certain wrongful acts, which may not, however, be punishable when committed by a single person, not acting in concert with others. The following are enumerated in text-books as the things, an agreement to do which, made between several persons, constitutes the offence of conspiracy:—(1) Falsely to charge another with a crime punishable by law, either from a malicious or vindictive motive or feeling towards the party, or for the purpose of extorting money from him; (2) wrongfully to injure or prejudice a third person or any body of men in any other manner; (3) to commit any offence punishable by law; (4) to do any act with intent to pervert the course of justice; (5) to effect a legal purpose with a corrupt intent or by improper means; to which are added (6) conspiracies or combinations among workmen to raise wages.

The division is not a perfect one, but a few examples under each of the heads will indicate the nature of the offence in English law. First, a conspiracy to charge a man falsely with any felony or misdemeanour is criminal; but an agreement to prosecute a man who is guilty, or against whom there are reasonable grounds for suspicion, is not. Under the second head the text-books give a great variety of examples,—e.g. mock auctions, where sham bidders cause the goods to go off at prices grossly above their real value; and associations to raise the price of goods by spreading false rumours; a conspiracy by persons to cause themselves to be reputed men of property, in order to deceive tradesmen. These examples show how wide the law stretches its conception of criminal agreement. The third head requires no explanation. A conspiracy to murder is expressly made punishable by penal servitude and imprisonment (The Offences against the Person Act 1861). A curious example of conspiracy under the fourth head is the case in which several persons were convicted of conspiracy to procure another to rob one of them, so that by convicting the robber they might obtain the reward given in such cases. The combination to effect a lawful purpose with corrupt intent or by improper means is exemplified by agreements to procure seduction, &c.

The most important question in the law of conspiracy, apart from the statute law affecting labourers, is how far things which may be lawfully done by individuals can become criminal when done by individuals acting in concert, and some light may be thrown on it by a short statement of the history of the law. In the early period of the law down to the 17th century, conspiracy was defined by the Ordinance of Conspirators of 1305:—“Conspirators be they that do confed or bind themselves by oath, covenant, or other alliance, that every of them shall aid the other falsely and maliciously to indite, or cause to indict, or falsely to move or maintain pleas, and also such as children within age to appeal men of felony, whereby they are imprisoned and sore grieved, and such as retain men in the cause with livers or fees to maintain their malicious enterprizes, and this extendeth as well to the takers as to the givers.” The offence aimed at here is conspiracy to indict or to maintain suits falsely; and it was held that a conspiracy under the act was not complete, unless some suit had been maintained or some person had been falsely indicted and acquitted. A doctrine, however, grew up that the agreement was in itself criminal, although the conspiracy was not actually completed (Poulterer’s case, 1611). This developed into the rule that any agreement to commit a crime might be sufficient to found a conspiracy. A still further development of this doctrine is that a combination might be criminal, although the object apart from combination would not be criminal. The cases bearing on this question will be found arranged under the following heads, and in chronological order, in the Law of Criminal Conspiracies and Agreements, by R. S. Wright (London, 1873):—Combinations against government; combinations to defeat or pervert justice; combinations against public morals or decency; combination to defraud; combination to injure otherwise than by fraud; trade combinations. “It is conceived,” says the author, “that on a review of all the decisions, there is a great preponderance of authority in favour of the proposition that, as a rule, an agreement or combination is not criminal unless it be for acts or omissions (whether as ends or means) which would be criminal apart from agreement.” A dictum of
Lord Denman's is often quoted as supplying a definition of conspiracy. It is, he says, either a combination to procure an unlawful object, or to procure a lawful object by unlawful means; but the exact meaning to be given to the word "lawful" in this antithesis has nowhere been precisely stated. A thing may be unlawful in the sense that the law will not aid it, although it may not expressly punish it. The extreme limit of the doctrine is reached in the suggestion that a combination to hiss an actor at a theatre is a punishable conspiracy.

The application of the wide conception of conspiracy to trade disputes and to civil questions arising out of contracts for service is dealt with under the headings LABOUR LEGISLATION, STRIKES AND LOCK-OUTS AND TRADE UNIONS. The criminal side is regulated by the Conspiracy and Protection to Property Act 1875, which enacted that "an agreement or combination by two or more persons to do, or procure to be done, any act in contemplation or furtherance of a trade dispute between employers and workmen shall not be indictable as a conspiracy, if such act committed by one person would not be punishable as a crime. When a person is convicted of any such agreement or combination to do an act which is punishable only on summary conviction, and is sentenced to imprisonment, the imprisonment shall not exceed three months, or so longer a period, if any, as may have been prescribed by the statute to which the punishment of the said act when committed by one person." The effect of the act of 1875 in connection with the Employers and Workmen Act of the same year is that breach of contract between master and workmen is to be dealt with as a civil and not as a criminal case, with two exceptions. A person employed on the supply of gas and water, breaking his contract with his employer, and knowing, or having reasonable cause to believe, that the consequence of his doing so, either alone or in combination with others, will be to deprive the inhabitants of the place wholly or to a great extent of their supply of gas or water, shall be liable on conviction to a penalty not exceeding £20, or a term of imprisonment not exceeding three months. And generally any person wilfully and maliciously breaking a contract of service or hiring, knowing or having reasonable cause to believe that the probable consequences of his so doing either alone or in combination with others will be to endanger human life or cause serious bodily injury, or to expose valuable property whether real or personal to destruction or serious injury, shall be liable to the same penalty. By section 7 every person who, with a view to compel any other person to abstain from doing or to do any other person to do any act of which such other person has a legal right to do or not to do, or in such manner that such other person is thereby induced to do, or not to do, or to attempt to do or not to do, the act, uses violence to or intimidates such other person or his wife and children, or injures his property, or (2) consistently follows such other person about from place to place; or (3) hides any tools, clothes or other property owned or used by such other person, or deprives him of or hinders him in the use thereof; or (4) watches or besets the house or other place where such other person resides, or works, or carries on business, or happens to be, or the approach to such house or place; or (5) follows such other person with two or more other persons, in a disorderly manner, in or through any street or road, shall be liable to the before-mentioned penalties. Of course a combination to do any of these acts would be punishable as a conspiracy, as mentioned in section 3 above.

Seamen are expressly exempted from the operation of this act.

The exceptions as to contracts of service for the supply of gas and water, &c., were supported by the circumstances of the London gas stokers' case in 1872.

Conspiracy at common law is a misdemeanour, and the punishment is fine or imprisonment, or both, to which may be added hard labour in the case of any conspiracy to cheat and defraud, or to obtain money or goods, or falsely to accuse any crime, and to obstruct, pervert, prevent or defeat the cause of justice. Conspiracy to murder, whether the victim be a subject of the king or resident in his dominions or not, is, by the Offences against the Person Act 1861, punishable by penal servitude.

United States.—The most generally accepted definition of conspiracy in the United States is "a combination of two or more persons by some concerted action to accomplish some criminal or unlawful purpose, or to accomplish some purpose not in itself criminal or unlawful by criminal or unlawful means." Though in some states, e.g., Colorado, it is not conspiracy under the statute to do a lawful act in an unlawful way (Lipschitz v. People [1898] 25 Col. 261). In some states an overt act must be shown (N.Y. Pen. Code, § 171). This is so in the Federal Courts, United States v. McCard (72 Fed. R. 150). Conspiracy out of the state to do any act which if done within the state would be treason is punishable by imprisonment not exceeding ten years (ibid. § 170). The United States Revised Statutes, § 5440, make any conspiracy to commit an act, declared by any law of the United States to be a crime, an offence against the United States, e.g., a conspiracy to plunder a wrecked vessel within the admiralty and maritime jurisdiction of the United States (U.S. v. Sanchez, 7 Fed. R. 715), conspiracy to violate the postal laws (Re Renkle [1903] 125 Fed. R. 990), to violate the revenue laws (U.S. v. Cohn [1904] 128 Fed. R. 613). It is not essential that the object be accomplished (Radford v. U.S. [1904] 129 Fed. R. 49). A conspiracy to depress the market price of stock by circulating false reports that the company was going into or out of business is indictable (N.Y. Pen. Code, § 168 (People v. Goslin [1901] 67 N.Y. App. D. 16, affirmed 171 N.Y. 637).

CONSTABLE, ARCHIBALD (1774-1827). Scottish publisher, was born on the 24th of February 1774 at Carnbee, Fife. His father was land steward to the earl of Kellie. In 1788 Archibald was apprenticed to Peter Hill, bookseller, of Edinburgh, but in 1795 he started in business for himself as a dealer in rare and curious books. He bought the Scots Magazine in 1801, and John Leyden, the orientalist, became its editor. In 1800 Archibald began the Farmer's Magazine, and in November 1802 he issued the first number of the Edinburgh Review, under the nominal editorship of Sydney Smith; Lord Jeffrey, was, however, the guiding spirit of the review, having as his associates Lord Brougham, Sir Walter Scott, Henry Hallam, John Playfair and afterwards Macaulay. Constable made a new departure in publishing by the generosity of his terms to authors. The writers for the Edinburgh Review were paid at an unprecedented rate, and Constable offered Scott 1000 guineas in advance for Marmion. In 1804 A. G. Hunter joined Constable as partner, bringing considerable capital into the business and making Constable a leading firm in the publishing world. In 1805, jointly with Longman & Co., Constable published Scott's Lay of the Last Minstrel, and in 1807 Marmion. In 1808 a split took place between Constable and Sir Walter Scott, who transferred his business to the publishing firm of John Ballantyne & Co., for which he supplied the greater part of the capital. In 1813, however, a reconciliation took place. The publishing firm of Ballantyne was in difficulties, and Constable again became Scott's publisher, a condition being that the firm of John Ballantyne & Co. should be wound up at an early date, though Scott retained his interest in the printing business of James Ballantyne & Co. In 1812 Constable, who had admitted Robert Cathcart and Robert Cadell as partners on the retirement of A. G. Hunter, purchased the copyright of the Encyclopaedia Britannica, adding the supplement (6 vols., 1816-1824) to the 4th, 5th and 6th editions (see Encyclopaedia). In 1814 he bought the copyright of Waterley. This was issued anonymously; but in a short time 12,000 copies were disposed of; Scott's other novels following in quick succession. The firm also published the Annual Register. Through such conspicuous success Constable's business flourished, and in 1826 a crash came. Constable's London agents stopped payment, and he failed for over £250,000, while James Ballantyne & Co. also went bankrupt for nearly £90,000. Sir Walter Scott was involved in the failure of both firms. Constable started business afresh, and began in 1827 Constable's Miscellany of original and selected works . . . consisting of a series of original works, and of standard books republished in a cheap form, thus making one of the earliest and most famous attempts to popularize wholesome literature. He died on the 21st of July 1827. After Constable's bankruptcy, Robert Cadell (1788-1849), who
had been his partner, in conjunction with Sir Walter Scott, bought from the various publishers in whose hands they were, all the poems in series which had been issued up to that time, and began the issue of the forty-eight volume edition (1820-1833). The result of its publication was that the debt on Abbotsford was redeemed, and that Cadell bought the estate of Ralno near Edinburgh, which he owned till his death on the 21st of January 1840.

Archibald Constable's son, Thomas (1812-1881), was appointed in 1839 printer and publisher in Edinburgh to Queen Victoria, and issued, among other notable series, Constable's Educational Series, and Constable's Foreign Miscellany. In 1865 his son Archibald became a partner, and when he retired in 1893 the firm continued under the name of T. & A. Constable.

See also Archibald Constable and his Literary Correspondents, by his son Thomas Constable (3 vols., 1873). This book contains numerous contemporary notices of Constable's, and dedicates him from the exasperation of J. G. Lockhart and others.

CONSTABLE, HENRY (1562-1613), English poet, was born in 1562. His father, Sir Robert Constable, was knighted by the earl of Essex in Scotland in 157o, and was the author of a work On the Ordering of a Camp. The poem went to St John's College, Cambridge, where he took his degree of B.A. in 1586. He was (or now became) a Roman Catholic, and we hear of him next in Paris, whence in 1584 and 1585 he wrote to Walsingham letters which still exist, and which prove Constable to have been in the secret service of the English government. A later correspondence with Essex contains protestations of his loyalty. He was probably still abroad, when, in the autumn of 1592, a London publisher issued Diana, the praises of his Mistress in certain sweet sonnets, by H. C., containing 23 poems. A reissue of this pamphlet in 1594 (misprinted 1593) was greatly enlarged, not by more sonnets which may or may not be Constable’s, but by eight poems which were certainly the work of Sir Philip Sidney. Published a few weeks after the Delia of Daniel, the original Diana of 1592 claims a very early place in the evolution of the Elizabethan sonnet. In a letter from one Pope to Scotland, the idea being that James VI. was to be supported in his claim to the English succession on condition of his setting English Romanists free from the existing disabilities. Constable’s mission came to nothing, and he entered the service of the king of France. Later he asked for permission to return to England, but it was refused. In consequence of a surreptitious excursion to London, he was captured and imprisoned in the Tower in 1604. After a manhood spent in almost continuous exile, Henry Constable died at Liége on the 9th of October 1613. The Diana was the only work printed in the poet’s life-time; it was augmented from MS. sources by H. J. Todd, in 1831. His Spiritual Sonnets first appeared in 1815, edited by Thomas Park. Almost the only known pieces by Constable which are not sonnets are the song of ’Diaphania,’ and the beautiful pastoral canzone on ’Venus and Adonis,’ contained in the England’s Helicon of 1609. In 1594 he prefixed four sonnets, addressed to the Earl of Essex, by Sir Philip Sidney, to that writer’s work Effusion. A proper work of devotion, The Catholic Moderator (1623), has been attributed to Constable. Who Diana was has never been determined, but it has been conjectured that she may have been Mary, countess of Shrewsbury, who was a distant cousin of the poet. The body of Constable’s writing is so small, and its authenticity so little supported by evidence, that it is rash to give a very definite opinion as to its character. But it is evident, from its undoubted productions, that he was much under the influence of the French poets of his time, particularly of Desportes, as well as of Petrarch and Sidney. That Shakespeare was acquainted with Constable’s poetry and admired it seems to be certain, and that he borrowed from it, “gives it,” as Mr Sidney Lee has said, “its most lasting interest.” In the arrangement of his rhymes, Constable usually keeps closer to the Petrarchan model than Daniel and the other contemporary sonneteers are accustomed to do. (E. G.)

CONSTABLE, JOHN (1776-1837), English landscape painter, was born at East Bergholt in Suffolk on the 11th of June 1776.

His father was a man of some property, including water-mills at Dedham and Flatford, and two windmills, in which John, the second son, was set to work at the age of seventeen, after leaving Dedham grammar school. From boyhood he was devoted to painting, which he studied in his spare time in company with John Dunthorne, a local plumber and glazier. While working thus he made the acquaintance of Sir George Beaumont, a mediocrity painter but a keen patron of the arts, and was inspired by the sight of Claude’s “Hagar and Ishmael” and by some drawings of Girtin which Sir George possessed. His passion for art increasing, he was allowed by his father to visit London in 1795 to consult the landscape-painter Joseph Farington, R. A. (1747-1821), who recognized his originality and gave him some technical hints. He also made the acquaintance of the engraver J. T. Smith, who taught him etching, and corresponded with him during the next few years, which were spent partly in London and partly in Suffolk. In 1797 he was recalled to work in his father’s counting-house at Bergholt, and it was not till February 1799 that he definitely adopted the profession of painting, and became a student at the Royal Academy. The few existing works of this period are heavy, clumsy and amateurish. Recognizing their faults, Constable worked hard at copying old masters “to acquire execution.” The remedy was effective, for his sketches on a tour in Derbyshire in 1801 show considerable freshness and accomplishment. In 1802 he exhibited at the Royal Academy, and was much helped and encouraged by the president, Benjamin West, who did him a further service by preventing him from accepting a drawing-mastership (offered by Archdeacon Fisher, of Salisbury), and thereby greatly stimulating his efforts. The manner of West appears strongly in the altarpiece painted by Constable for Brantham church in 1804, but Gainsborough, the Dutch masters and Girtin are the predominant influences upon his landscape, especially Girtin in the year 1805, and in 1806, when he visited the Lake District. From 1806 to 1809 Constable was frequently engaged in painting portraits or in copying portraits by Reynolds and Hopnner. The effect on his landscape was great. He learned how to compose an oil painting, and the efforts of the next few years were devoted to combining this knowledge with his innate love of the fresh colour of nature.

With the year 1811 began a critical period. He exhibited a large view of Dedham Vale, in which the characteristic features of his art appear for the first time almost fully developed, and he became attached to Miss Maria Bicknell. His suit was opposed by the lady’s relatives, and Constable’s apparently hopeless prospects drove him again to portrait-painting, in which he acquired considerable skill. It was not till the death of his father in 1816 that he was able to marry and settle in No. 1 Keppel Street, Russell Square, where a succession of works now well known were painted: “Flatford Mill” (1817), “A Cottage in a Cornfield,” and in 1819 “The White Horse,” which was bought by his great friend Archdeacon Fisher for £105, as was the view of Stratford Mill in 1826. In 1819 two legacies each of £4000 diminished his domestic anxieties, and he was recognized by his election in November to the associateship of the Royal Academy. The series of important works was continued by “The Haywain” (1821), “A View on the Stour” (1822), “Salisbury Cathedral from the Bishop’s Garden” (1823), and “The Lock” (1824). This last year was a memorable one. “The Haywain” was sold to a Frenchman, was exhibited at the Louvre, and, after creating a profound sensation among French artists, was awarded a gold medal. In the following year “The White Horse” won a similar distinction at Lille. In 1825 he exhibited “The Leaping Horse” (perhaps his masterpiece), in 1836 “The Cornfield,” in 1827 “The Marine Parade and Chain Pier, Brighton,” and in 1828 “Dedham Vale.”

In 1822 Constable had taken Farington’s house, 35 Charlotte Street, Fitzroy Square, but his wife’s failing health made him turn his attention to Hampstead, and after temporary occupation first of a Lower Terrace and then of a house on Downshire Hill, he took No. 6 Well Walk, in 1827, letting the greater part of his London house. In 1828 his financial position was made
secure by a legacy of £20,000 from Mr Bicknell, but the death of his wife towards the end of the year was a shock from which he never wholly recovered. His election to membership of the Academy in the following year did not lessen his distress: he felt that the honour had been delayed too long. His chief exhibit in 1829 was "Hadleigh Castle," and this was succeeded by the great "Salisbury Cathedral from the Meadows" (1831), "The Opening of Waterloo Bridge" (1832), which had been begun in 1817, "Englefield House" (1833), "The Valley Farm" (1835), "The Cenotaph" (1836), and "Arundel Mill and Castle" (1837). Constable had long suffered from rheumatism and nervous depression, but his sudden death on the 31st of March 1837 could be traced to no definite disease. He was buried in Hampstead churchyard, where his tomb may still be seen.

In May 1838 his remaining works were sold at auction, but fetched very small prices. Many were bought in by his children, and through their generosity have passed to the national collection at Trafalgar Square, Millbank and South Kensington testify. Nowhere else can Constable's art be studied completely or safely, since forgeries and imitations are common and have crept into the Louvre and other famous galleries. Much of the power of his work survives in the noble series of mezzotints made after his sketches by David Lucas, and first issued in 1816, but not in the edition of 1830. The excellence of presentation, this English Landscape series is now deservedly prized, as are the other plates which Lucas engraved after Constable. Constable himself made a few desultory experiments in etching, but they are of no importance.

As already indicated, the mature art of Constable did not develop till after the year 1811, when he began to combine the fresh colour of nature, which he had learned to depict by working in the open air, with the art of making a picture, which he had learned from painting portraits and copying those of other masters. His development was unusually slow, and his finest work, with but few exceptions, was done between his fortieth and fiftieth years (1816-1826). During the last twelve years of his life his manner became more free, and the palette knife was constantly used to apply spots and splashes of pure colour, so that his technique often suggests that afterwards employed by the Impressionists. Yet his direct influence upon French landscape has sometimes been overrated. When Constable first exhibited at the Salon in 1825 Théodore Rousseau, the pioneer of French naturalism, was only twelve years old, and the movement had much further to go. The excellence of Constable's art was rewarded by the critics, whose pronouncements, this English Landscape series is now deservedly prized, as are the other plates which Lucas engraved after Constable. Constable himself made a few desultory experiments in etching, but they are of no importance.

Since the British nation came into the possession of a large portion of Constable's pictures and sketches, his work has been better understood. Though limited in range of subject to the scenery of Suffolk, Hampstead, Salisbury and Brighton, his sketches express the tone, colour, movement and atmosphere of the scenes represented with unrivalled force and truthfulness, and modern criticism tends to rate their spontaneity above the deliberate accomplishment of his large finished works. His treatment of skies is specially notable. Here his early experience as a miller told in his favour. No one has painted English cloud effects so truthfully, or used them as a compositional quantity with such skill. Though he was influenced in France by Géricault, while in England the water-colour painters led the way. Constable's death in 1837 removed the man and most of his work from the public eye for another generation, and he became a famous shadow rather than a living force. So Monet and the Impressionists, when they sought after the secret of painting air and sunshine, looked to Turner rather than to Constable, and in England the eloquence of Ruskin pointed in the same direction.

Who took their ideas from other painters instead of getting them directly from nature.

CONSTABLE, SIR MARMADUKE (c. 1455-1518). English soldier, was descended from a certain Robert (d. 1216), lord of Flamborough, who was related to the Lacies, hereditary constables of Chester, hence the surname of the family. A son of Sir Robert Constable (d. 1488), Marmaduke was in France with Edward IV. in 1475 and with Henry VII. in 1492. He was sheriff of Staffordshire and Yorkshire, was in high favour with Henry VII. and Henry VIII., and led his kinsmen and retainers to the battle of Flodden in 1513. He was twice married, and left several sons when he died on the 20th of November 1518. In Flamborough church one may still read a rhyming epitaph describing Constable's life and prowess.

Sir Marmaduke's eldest son, Sir Robert Constable (c. 1478-1537), knighted by Henry VIII. to defeat the Cornish rebels at Blackdown and 1497. In 1536, when the rising known as the Pilgrimage of Grace broke out in the north of England, Constable was one of the insurgent leaders, but towards the close of the year he submitted at Doncaster and was pardoned. He did not share in the renewal of the rising which took place in January 1537; but he refused the king's invitation to proceed to London, and was arrested. Tried for treason, he was hanged at Hull in the following June.

Sir Marmaduke's second son, Sir Marmaduke Constable (c. 1480-1549), was knighted after the battle of Flodden, and was at the Field of the Cloth of Gold in 1526. He was a knight of the shire for Yorkshire and then for Warwickshire, and was a member of the Council of the North from 1537 until his death.

Another noteworthy member of this family was the regicide, Sir William Constable (d. 1655), who was created a baronet in 1611. A member of the Long Parliament, he fought with distinction among the parliamentarians at Edgehill; in 1644 his military enterprises in north Yorkshire were very successful, and later he guarded the king at Carlisle, and was governor of York. Hailed as one of the king's judges, was a member of the council of state under Cromwell, and died in London on the 25th of June 1655.

CONSTABLE (O. Fr. connestable, Fr. constable, Med. Lat. comestabilis, constabilis, constabularius, from the Lat. comes stabuli, count of the stable), a title now confined to the lord high constable of England, the lord constable of Scotland, the constables of some royal castles in England, and to certain executive legal officials of inferior rank in Great Britain and the United States.

The history of the constable is closely analogous to that of the marshal (q.v.); for just as the modern marshals, whatever their rank or office, are (caseably both as to their title and functions to the marqueses, or master of the horse, of the Frankish kings, so the constable, whether he be a high dignitary of the royal court or a "petty constable" in a village, is derived by a logical evolution from the counts of the stable of the East Roman Emperors.

The Byzantine comes stabuli (κωμή τοῦ σταβυλοῦ) was in his origin simply the imperial master of the horse, the head of the special equestrian guard, and a great officer of state. From the East the title was borrowed by the Frankish kings, and during the Carolingian epoch a comes stabuli was at the head of the royal stables, the marshals (morescoci) being under his orders. The office survived and expanded in France under the Capetian dynasty; in the 11th century the constable has not only the general superintendence of the royal stables, but an important command in the army—though still under the orders of the seneschal,—and certain limited powers of jurisdiction. From
CONSTANCE

This time onward the office of constable tended, in France, continually to increase in importance. On the abolition of the seneschalship by King Philip Augustus in 1191, the constable succeeded to many of his powers and privileges. Thus in the 13th century he claimed as of right the privilege of serving as the vanguard of the army. Under Philip the Fair (1268-1314) he begins to be invested with the military government of certain provinces as lieutenant of the king (locum tenens regis); and, finally, in the 14th century, owing to the confusion of his high prerogatives as the royal lieutenant with his functions as constable, he is, as constable, recognized as commander-in-chief of the army. The French kings never allowed the office of constable to become hereditary, and in January 1627, after the death of François de Bonne, duc de Lesdiguières, the office was suppressed by royal edict. Napoleon created the office of grand constable for his brother Louis, and that of vice-constable for Marshal Berthier, but these were suppressed at the Restoration.

The jurisdiction of the constable, known as the constable et marchéchaussée de France, was held in fee until the abolition of the office of constable, when it became a royal court, without, however, changing its name. Henceforth it was nominally under the senior marshal of France, and all marshals had the right of sitting as judges; but actually it was presided over by the lieutenant général with the lieutenant particulier and the procureur du roi as assessors. At first peripatetic, its seat was ultimately fixed at Paris, as part of the organization of the department. Its jurisdiction, which included all military persons and causes, was somewhat vaguely extended to embrace all crimes of violence, &c., committed outside the jurisdiction of the towns; it thus came often into conflict with that of the other royal courts.

The office of constable was not confined on the continent to France. The Gothic kings of Spain had their comites stabuli; so did, later on, the kings of Naples, where the functions of this officer were much the same as in France. The great vassals of the French crown, moreover, arranging their households on the model of that of the king, had their constables, whose office tended for the most part to become hereditary. Thus the constabulary of the city of Toulouse was hereditary in the family of Sabran, that of Normandy in the house of Crespin.

In England the title of constable was unknown before the Conquest, though the functions of the office were practically those of the English staller. In the laws of Edward the Confessor the title constable is mentioned as the French equivalent for the English heretoga, or military commander (dux exercitus). But among the great officers of the Norman-English court the constable was as yet merely the commander of the quartermain. Under the Great Seal of the reign of Stephen it is styled constable general. In England, however, the office soon became hereditary, the constable never attaining the same commanding position as in France, though the military duties attached to his office prevented its sinking into a mere grand seigneur. He was not the superior of the marshal, the functions of the two offices being in fact hardly distinguishable.

From the first, moreover, the title of constable was not confined to the constable proper, whose office in the reign of Stephen was made hereditary under the style of high constable (see Lord High Constable); for every command held under the supreme constabularia was designated by this name, and there were constables of troops, of castles, of garrisons and even of ships (constabularia navigii regis). Under the Norman and Angevin kings, then, the title had come to be loosely applied to any high military command. Its extension to officials exercising civil jurisdiction is not difficult to account for. In feudal society, based as this was on a military organization, it is easy to see how the military jurisdiction of the constables would tend to encroach on that of the civil magistrates. The origin of the modern chief and petty constables, however, is to be traced to the Statute of Winchester (1195 c.), by which the national militia was composed of officers designated by a blending of the military system with the constitution of the shires. Under this act a chief or high constable was appointed in every hundred; while in the old tithings and villaiis the village bailiff was generally appointed a petty constable, receiving in addition to his old magisterial functions a new military office.

From the time of Edward III. the old title of revee or tithing-man is lost in that of constable, which represents his character as an officer of the peace as well as of the militia. The high and petty constables continued to be the executive legal officers in the several counties until the County Police Acts of 1839 and 1840 reorganized the county police. In 1842 an important state statute was passed enacting that for the future no appointment of a petty constable, headborough, bosholder, tithing-man, or peace officer of the like description should be made for any parish at any court leet, except for purposes unconnected with the preservation of the peace, and providing, as a means of increasing the security of persons and property, for the appointment by justices of the peace in divisional petty sessions of fit persons or their substitutes to act as constables in the several parishes of England, and giving vestries an optional power of providing paid constables. Under the acts of 1839 and 1840 the establishment of a paid county police force was optional with the justices. With the Police Act of 1856 this optional power became compulsory, and henceforth the history of the petty constable in England is that of the police. In 1869 provision was made for the abolition of the old office of high constable (the High Constables Act 1869) and, as the establishment of an efficient police force rendered the general appointment of parish constables unnecessary, the appointment ceased, subject to the appointment by vestries of paid constables under the chief constable of the county (Parish Constables Act 1872). See further Police.

"Special constables" are peace officers appointed on occasional emergencies when the ordinary police force is thought to be deficient. The appointment of special constables is for the most part regulated by an act of 1831. In the absence of volunteers the office is compulsory, on the appointment of two justices. The lord-lieutenant may also appoint special constables and the statutory exemptions may be disregarded, but voters cannot be made to serve during a parliamentary election. While in office special constables have all the powers of a common law constable, and in London those of a metropolitan police officer.

In the United States, outside the larger towns, the petty constable retains much the same status as in England before the act of 1842. He still has a limited judicial power as conservator of the peace, and often exercises various additional functions, such as that of tax-collector or Overseer of the roads or other duties, as may be decided for him by the community which appoints him. In the old colonial days the office, borrowed from England, was of much importance. The office of high constable existed also in Philadelphia and New York, in the latter the title of constable being retained for the chief of the police force.

CONSTANCE (Ger. Konstanz or Costniz), a town in the grand-duchy of Baden. It is built, at a height of 1303 ft. above the sea, on the S. or left bank of the Rhine, just as it issues from the Lake of Constance to form the Untersee. The town communicates by steamer with all the places situated on the shores of the Lake of Constance, while by rail it is 30 or 31 m. by one or other bank of the Rhine from Schaffhausen (on the W.) and 225 m. along the S.W. shore of the lake from Rorschach (S.E.). In 1905 it numbered 24,818 inhabitants, mostly German-speaking and Romanists. A fine bridge leads north over the Rhine to one suburb, Petershausen, while to the south the town gradually merges into the Swiss suburb of Kreuzlingen. It is a picturesque little town, with several noteworthy medieval buildings.

The former cathedral church was mainly built 1060-1069, but was later gothicized; near the west end of the nave a plate in the floor marks the spot where Huss stood when condemned to death, while in the midst of the choir is the brass which covered the grave of Robert Hallam, bishop of Salisbury, who died here in 1417, during the council. The old Dominican
constituent, on an island east of the town, is now turned into a hotel, but the buildings (especially the cloisters) are well preserved. The 14th century Kasthaus (warehouses for goods) was the scene of the council that elected Martin V., but the council really sat in the cathedral church. The town-hall dates from 1592, and has many points of interest. In the market-place, side by side, are two houses wherein two important historical events are said to have taken place—in the "Gasthaus zum Barbarossa" Frederick Barbarossa signed the peace of Constance (1183), while in the house named "zum Hohen Hafen" the emperor Sigismund invested Frederick of Hohenzollern with the mark of Brandenburg (1417). On the outskirts of the town, to the west, in the Brühl suburb, a stone marks the spot where Hus and Jerome of Prague were burnt to death. The Rosgarten museum contains various interesting collections. Constance is the centre of a brisk transit trade, while it has various factories and other industrial establishments.

Constance owes its fame, not to the Roman station that existed here, but to the fact that it was a bishop's seat from the 6th century (when it was transferred either from Vindonissa, near Brugg, in the Aargau) till its suppression in 1821, after having been secularized in 1803 and having lost, in 1814-1815, its Swiss portions. The bishop was a prince of the Holy Roman Empire, while his diocese was one of the largest in Germany, including (shortly before the Reformation) most of Baden and Württemberg, and 12 out of the 22 Swiss cantons (all the region on the right bank of the Aare, save the portions included in the diocese of Coire)—in it were comprised 350 monasteries, 1760 benefices and 17,000 priests. It was owing to this important position that the see city of the diocese was selected as the scene of the great reformation council, 1414-1418 (see below), which deposed all three rival popes, elected a new one, Martin V., and condemned to death by fire John Huss (6th of July 1415) and Jerome of Prague (23rd of May 1416). In 1192 (some writers say in 1259) the city became an imperial free city, but the bishop and his chapter practically ruled it till the time of the Reformation. Constance is the natural capital of the Thurgau, so that when in 1460 the Swiss wrested that region from the Austrians, the town and the Swiss Confederation should have been naturally drawn together. But Constance refused to go up to the Swiss the right of exercising criminal jurisdiction in the Thurgau, which it had obtained from the emperor in 1417, while the Austrians, having bought Bregenz (in two parts, 1451 and 1523), were very desirous of securing the well-placed city for themselves. In 1530 Constance (whose bishop had been forced to flee in 1527 to Meersburg, on the other side of the lake, and from that time the episcopal residence) joined, with Strassburg, Memmingen and Lindau, the Schmalkalden League. But after the great defeat of the Protestants in 1547, in the battle of Mühlberg, the city found itself quite isolated in southern Germany. The Austrians had long tried to obtain influence in the town, especially when its support of the Protestant cause attracted the sympathy of the Habsburgs. Here Hemhut (1479) was defeated, and in 1484 forced it, after a bloody, though unsuccessful, fight on the bridge over the Rhine, not merely to surrender to the imperial authority and to receive the bishop again, but also to consent to annexation to the Austrian family dominions. Protestantism was then vigorously stamped out. In 1633 Constance resisted successfully an attempt of the Swedes to take it, and, in 1805, by the treaty of Pressburg, was handed over to Austria to Baden.

Maurer, Der Übergang der Stadt Konstanz von der Heimtück zu ihrem Heimkehr (Frauenfeld, 1904). (W. A. B. C.)

CONSTANCE, COUNCIL OF. This council, convoked at the instance of the emperor Sigismund by Pope John XXIII.—one of the three popes between whom Christendom was, at that time divided—with the object of putting an end to the Great Schism of the West and reforming the church, was opened on

the 6th of November 1414 and did not close until the 22nd of April 1418. In spite of his reluctance to go to Constance, John XXIII., who succeeded Alexander V. (the pope elected by the council of Pisa), hoped that the new council, while continuing the work of the council of Pisa, would proclaim him sole legitimate pope and definitely condemn his two rivals, Gregory XII. and Benedict XIII. But he was soon forced to renounce this hope. So urgent was the need of restoring union at any cost that even prelates who had taken an active part in the work of the council of Pisa, such as Pierre d'Ailly, cardinal bishop of Cambrai, were forced to admit, in view of the fact that the decisions of that council had been and were still contested, that the only possible course was to reconsider the question of the union de novo, entirely disregarding all previous deliberations on the subject, and treating the claims of John and his two competitors with the strictest impartiality. Feebly supported by the Italians, by the majority of the cardinals, and by the representatives of the king of France, John soon found himself in danger of being driven to abdicate. With the connivance of the duke of Austria he fled, first to Schaffhausen, then to Laufenburg, Freiburg, and finally to Breisach, in the house of egging in Burgundian territory the pressure exerted upon him by the emperor and the fathers of the council. His flight, however, only precipitated events. Sigismund declared war on the duke of Austria, and the fathers, determined to have their will carried out, drew up in their 4th and 5th sessions (30th of March and 6th of April 1415) a set of decrees with the intention of justifying their attitude and putting the fugitive pope at their mercy. Interpreted in the most general sense, these decrees, which enacted that the council of Constance derived its power immediately from Jesus Christ, and that every one, even the pope, was bound to obey it and every legitimately assembled general council in all that concerned faith, reform, union, &c., were tantamount to the overturning of the constitution of the church by establishing the superiority of the council over the pope. Their terms, however, could not fail to give rise to some ambiguity, and their validity was especially contested on the ground that the council was not ecumenical, since it represented at that date the obedience of only one of three rival popes. Nevertheless, John, who had been abandoned by the duke of Austria and imprisoned in the castle of Radolfzell, near Constance, was arraigned, suspended and deposed (May 29th), and himself ratified the sentence of the council.

Pope Gregory XII. was next required to renounce his rights, and this he did, with as much independence as dignity, through a legate, who previously convoked the council in the name of his master, and thus in some sort gave it the necessary confirmed authority. This was the regular extinction of the line of pontiffs who, if the validity of the election of Urban VI. on the 8th of April 1378 be admitted, had held the legitimate papacy for thirty-seven years.

All that remained was to obtain the abdication of Benedict XIII., successor of the Avignon pope Clement VII., but the combined efforts of the council and the emperor were powerless to overcome the obstinacy of the Aragonese pope. It was in vain that Sigismund journeyed to Perpignan, and that the kings of Aragon, Castile and Navarre ceased to obey the aged pontiff. Abandoned by almost all his adherents Benedict found refuge in the castle of Peñiscola on an impregnable rock overlooking the Mediterranean, and remained intractable. At the council proceedings were instituted against him, which ended at last on the 26th of July 1417 in his deposition. In this sentence it is to be noted that the council of Constance was careful not to base itself upon the former decision of the council of Pisa. The action of the council of Constance in renewing the condemnation of the doctrines of Wycliffe pronounced at Rome in 1413, and in condemning and executing John Huss and Jerome of Prague, is dealt with elsewhere (see Wycliffe; Huss; Jerome of Prague). Nor is it possible to mention here all the intrigues and quarrels that arose during three and a half years among the crowd of prelates, monks, doctors, simple clerks, princes and ambassadors composing this tumultuous assembly—perhaps
the greatest congress of people the world has ever seen. From the outset, voting by count of heads had been superseded by voting according to nations, i.e. all questions were deliberated and settled in four distinct assemblies—the Italian, the French, the German and the English,—the decisions of the nations being merely ratified afterwards pro forma by the council in general congregation, and also, if occasion arose, in public session. These four groups, however, were of unequal importance, and thanks to this arrangement the English, although weakest in number of points, were able to exercise some influence in the council. As if they had formed a fourth of the voters—a influence, for instance, as the Italians, who had an imposing numerical force. This anomaly aroused lively protests, especially in the French group, after the battle of Agincourt had rekindled national animosity on both sides. The arrival of the Spaniards at Constance necessitating the formation of a fifth nation, Pierre d’Ally availed himself of the opportunity to ask whether the English nation might be merged in the German, or that each great nation might be allowed to divide itself into little groups each equivalent to the English nation. It is not difficult to imagine the storm aroused by this indiscreet proposal; and had not the majority of the Frenchmen assembled at Constance had the sagacity to refuse to uphold the cardinal of Cambrai on this point, the upshot would have been a premature dissolution of the council.

Another source of trouble was the attitude of the emperor Sigismund, who, not content with protecting by his presence and as far as possible directing the deliberations of the "Universal Church," followed on more than once occasion a policy of violence and threats, a policy all the more irritating since, weary of his previously assumed role of peacemaker between the Christian powers, he had abruptly allied himself with the king of England, and adopted an extremely hostile attitude towards the king of France.

The reform which the council had set itself to effect was a subject of the fullest interest to the fathers could not broach without stirring up dissension: some stood out obstinately for preserving the status quo, while others contemplated nothing less than the transformation of the monarchical administration of the church into a parliamentary democracy, the subordination of the sovereign pontiff, and the abolition of the Sacred College. In view of these difficulties, the opinion which tended to assure the success of one at least of the great tasks before the council, viz. the re-establishment of unity by the election of a single pope, finally prevailed in despite of Sigismund. The general reform on which the council had failed to come to an understanding had to be adjourned, and the council contented itself with promulgating, on the 9th of October 1417, the only reforming decrees on which an agreement could be reached. The principle of the periodicity of the councils was admitted; the first was to assemble after the lapse of five years, the second within the next seven years, and subsequent councils to be maintained. In the event of the council being unable to decide, it was admitted that the council, which bound itself to assemble immediately, even without formal convocation, was to remain sole judge of the conflict. After his election the pope had to make a profession of the Catholic faith, and give guarantees against arbitrary translations. Finally, the council pronounced in favour of the pope’s renunciation of the right to the movable property of deceased prelates (spolium) as well as of the right of procurations. The execution of the surplus of the great reform of the church in its head and members was left to the hands of the future pope, who had to proceed conjointly with the council, or rather with a commission appointed by the nations—in other words, once the new pope was elected, the fathers, conscious of their impotence, were disinclined to postpone their dispersion until the laborious achievement of the reform. They were weary of the business, and wished to be done with it.

In order to rebuild the see of St Peter on a basis now cleared of obstacles, an attempt was made to surround the election of the future pope with all the necessary guarantees. The authority of the cardinals, who were the only persons judicially invested with the right of electing the pope, emerged from the crisis through which the church had just passed in fair too feeble and contested a condition to carry by its own weight the general assent. It was therefore decided that with the cardinals each nation should associate six delegates, and that the successful candidate should be required to poll two-thirds of the suffrages, not only in the Sacred College, but also in each of these five groups. The advantage of this arrangement was that the choice of the future pope would depend, not only on the vote of the cardinals, thus safeguarding tradition, but at the same time on the unanimous consent of the various nations, by which the adhesion of the whole Catholic world to the election would be guaranteed. There was, indeed, a danger lest the rivalries in the assembly might render it exceedingly difficult, not to say impossible, to obtain such unanimity. But at the end of three days the conclave resulted in the election of Cardinal Otto Colonna, who took the name of Martin V. (11th of November 1417), and the Great Schism of the West was at an end.

To conform to the decrees of the council, the new pope drew up a project of reform with the concurrence of the fathers still remaining at Constance, and subsequently made various reforming treaties or concordats with the nations of the council, which finally broke up after the 4th session, held on the 22nd of April 1418. To all seeming the pope had admitted the canonicy of several of the decrees of Constance—for instance, he had submitted to the necessity of the periodical convocation of other councils; but from his reticence on some points, as well as from his general attitude and some of his constitutions, it appeared that the whole of the decrees of Constance did not receive his unqualified approval, and without any definite pronouncement he made some reservations in the case of decrees which were detrimental to the rights and pre-eminence of the Holy See.

The Lake of Constance, LAKE OF, or lake of Bregenz, and now usually named in German Bodensee, as well as the “Swabian Sea”), the most extensive sheet of water in the Alpine region, after the Lake of Geneva. It is situated on the north-east frontier of Switzerland, and is formed by the Rhine. Its shape is oblong, while at its north-western extremity it divides into two arms, the Untersee (from Constance to Stein-am-Rhein) and the Überlingersee (running up to Ludwigshafen). The length of the lake from Bregenz to Stein-am-Rhein is 46 m., while that from Bregenz to Ludwigshafen is but 40 m. Its surface is 1’309 sq. ft. above sea-level, the greatest width is 109 m., and the greatest depth 827 ft. The area of the lake is 204 sq. m., of which 814 sq. m. have belonged to Switzerland since 1805, the canton of Thurgau holding 504 sq. m. and that of St Gall 114 sq. m. Austria has held Bregenz, at the south-eastern angle of the lake, since 1451, while the north end of the lake belongs to Baden (Constance held since 1805), and bits of its eastern shore form part of Württemberg (Friedrichshafen, formerly called Buchhorn, since 1810) and of Bavaria (Lindau since 1805). The first steamer was placed on its waters in 1824. Numerous remains of lake-dwellings have been found on the shores of this lake (see E. von Tröltsch, Die Pfahlbauern des Bodenseegebietes, Stuttgart, 1902).

CONSTANTS, JEAN ANTOINE ERNEST (1833–1904), French statesman, was born at Béziers. He began his career as professor of law, and in 1876 was elected deputy for Toulouse. He sat in the Left Centre and was one of the 363 of the 16th of May 1877. Re-elected in October 1877, he joined Freycinet as minister of the interior in May 1880, holding this portfolio until the 14th of November 1881. On the 22nd of February 1880 he again assumed the same office in the Tirard cabinet. He became prominent as a stalwart opponent of the Boulanger party.
constituting the senate a high court of justice, and taking police measures against the Ligue des patriotes. He resigned on the 1st of March 1890, but his resignation involved the fall of the cabinet, and he resumed his portfolio in the Freycinet cabinet on the 17th of March. On the 29th of December 1890 he had been elected senator by the department of the Haute-Garonne. He was violently attacked by the press and the Boulangist deputies, but did not resign until the whole cabinet withdrew, on the 26th of February 1892. In December 1898 he was appointed ambassador at Constantinople.

CONSTANT, BENJAMIN (1845–1902), French painter, was born in Paris, and studied under Cabanel. His first Salon picture, “Hamlet et le Roi,” was hung in 1869, and he became at once one of the recognized modern masters in France. In addition to a number of subject-pictures, such as “Trop Tard” (1870), “Samson et Delilah” (1871), and others taken from Moroccan studies, he was an eminent painter of portraits of some of the most prominent men and women of the day, one of his last being that of Queen Victoria (1900). He was a member of the Institut de France and received several French and foreign decorations.

CONSTANT DE REBEQUE, HENRI BENJAMIN (1767–1830), French writer and politician, was born at Laussanne on the 25th of April 1767. After an apothecary's education at Brussels, he was sent to Oxford, and thence to Erlangen; a subsequent residence at Edinburgh and the relations there formed with prominent Whigs profoundly influenced his political views. He returned to Switzerland in 1786, and in the next year visited Paris, where he met Madame de Charrière, a Dutchwoman who had married into a Swiss family with which his own was connected. Madame de Charrière, although twenty-seven years older than Constant, became his mistress, and the liaison, an affair possibly more of the intellect than of the heart, lasted until 1826, when Constant became intimate with Madame de Staël. After an escaptade in England in 1787, he spent two months with her at Colombier before becoming, in deference to his father’s wishes, chamberlain at the court of Charles William, duke of Brunswick, where in 1789 he married one of the ladies-in-waiting, Wilhelmina, Baroness Charman. The duke’s share in the coalition against France made his service incompatible with Swiss sentiment, and Constant retired to Hanover, where he remained always a faithful republican, and, on the dissolution of his marriage in 1819, he resigned his post. Meanwhile his father had been accused of malversation of the funds of his regiment; Benjamin helped him with his defence, with the result that he was finally exonerated and restored to the service with the rank of general.

Constant, who had met Madame de Staël at Lausanne in 1794, followed her in the next year to Paris, where he rapidly became a personage in the moderate republican circle which met in her salon; and by 1796 he had established with her intimate relations, which, in spite of many storms, endured for ten years. In 1796 he published two pamphlets in defence of the Directory and against the counter-revolution, “De la force du gouvernement actuel et de la nécessité de se rallier” and “Des réactions politiques.” He was one of the promoters of the constitutional club of Salm, formed to counterbalance the royalist club of Clichy, and he supported Barras in 1797 and 1799 in the coups d’état of 18 Fructidor, and of 18 Brumaire. In December 1799, he was nominated a member of the Tribunate, where he showed from the outset an independent and unconquerable Republican, by whom he was removed in the “creaming” of that assembly in 1802. His incessant opposition was attributed partly to his association with Madame de Staël, whose salon was a centre for those disaffected from the Napoleon régime, and in 1803 he followed her into exile. After M. de Staël’s death in 1802, there was no longer any obstacle to their marriage, but Madame de Staël was apparently unwilling to change her name. Much of Constant’s time was spent with her at Coppet; but he also made long sojourns at Weimar, where he mixed in the Goethe-Schiller circle, and accumulated material for the great work on religion which he had begun, so far back as 1787, at Colom-
sentiment imperishable under its varying forms. Besides Adolphe, in its way as important as Chateaubriand's René, he left a series of novels in MS., which are apparently lost. His political tracts were collected by himself as, Collection complète des ouvrages publiés sur...la France, formating a spéce de cours de politique constitutionnelle...vol. vi., 1818-1820), as were his Discours à la Chambre des Députés (2 vols., 1827).

AUTHORITIES.—See Constant's Cahier rouge, published first in 1907, containing his autobiography from 1707 to 1787; Journal intime (1804-1816), re-edited with the Letters of Madame de Stael in 1879; the semi-autobiographical Adolphe; his letters to Madame de Charrière; to Madame Récamier, edited by Madame Lenormant in 1882. His ordinary diary has disappeared, with his letters to his wife and to Madame de Stael. See further analysis by Léon de Terra, Anecdotes de la vie de Constant (1907); H. Cazalis, B. Constant (1879); The Réminiscences of J. J. Coulmann (3 vols., 1862-1869); Ed. Herriot, Madame Récamier et ses amis (1903); Sainte-Beuve in Derniers portraits littéraires (B. Constant and Adolphe, Cahier Vol. xi.).

CONSTANTIA, a district of Cape Colony, in the Cape peninsula, noted for the excellent quality of its wines, the best produced in South Africa. The government wine farm, Groot Constantia, 10 m. S. of Cape Town, contains over 150,000 vines. This and the adjacent farm of High Constantia are the only farms on which the vines yield the finest wines flourish. The district is also celebrated for the excellence of the fruit it yields. Groot Constantia House is a good example of the Dutch colonial dwelling-houses of the 17th century. It was built (c. 1684) by the governor Simon van der Stell, and named in honour of his wife Constanze. Van der Stell also laid out the vineyard, which soon attained a wide reputation. Old Cape Colony, by Mrs A. F. Trotter (London, 1903), contains a plan and sketches of Groot Constantia.

CONSTANTIN, the name of several Roman and Later Roman emperors.

CONSTANTINE I., known as "The Great" (287-337), Roman emperor—Flavius Valerius Constantinus, born on the 27th of February, probably in 287, at Naisus (the modern Nish) in Upper Moesia (Servia). He was the illegitimate son of Constantius I. and Flavia Helena (described as St Ambrose as an innkeeper). His father, already a distinguished officer, soon afterwards became praefectus pridorio, and in 303 was raised to the rank of Caesar and placed in command in the western provinces. While still a boy, Constantine was sent—practically as a hostage—to the Eastern court. He accompanied Diocletian to the East in 302, was invested with the rank of tribunus primi ordinis and served under Galerius on the Danube. In 305 Diocletian and Maximinus abdicated, and Constantius and Galerius became Augusti, while Severus and Maximinus Daia attained the rank of Caesares. Constantius now demanded from Galerius the restoration of the western provinces, which was refused, and the resulting quarrel led that Constantine only escaped from the court of Galerius by flight, and evaded pursuit by carrying off all the post-horses! He traversed Europe with the greatest possible speed and found his father at Bononia (Boulogne), on the point of crossing to Britain to repel an invasion of Picts and Scots. After gaining a victory, Constantine died at Eboracum (York), and on the 25th of July 306, the army accorded his son as Augustus. Constantine, however, displayed that union of determination and prudence which the occasion required. He accepted the nomination of the army with feigned reluctance and wrote a carefully-worded letter to Galerius, disclaiming responsibility for the action of the troops, but requesting recognition as Caesar—a position to which he sought naturally, and was peremptorily required. He therefore received the credentials of Caesar, and was formally recognized as Augustus (A.D. 307); their alliance was confirmed by the marriage of Constantine with Fausta, the daughter of Maximianus, and the father and son-in-law held the consularship, which, however, was not recognized in the East. Galerius now invaded Italy, but was forced by a mutiny of his troops to retire from the gates of Rome. Maximianus urged Constantine to fall upon the flank of his retiring army, but he once more showed his determination to tread the strict path of legitimacy. Maximianus, after the failure of his attempt to depose his son Constantine, was forced to seek refuge with Constantine, and became a quantité négligeable. In 308 Diocletian and Galerius held a conference at Carnuntum and determined to annul the actions of the Western rulers. Maximianus was set aside, Licinius invested with the purple as Augustus of the West (Nov. 11), while the title silius Augustorum was conferred upon Constantine and Maximinus Daia, and the former was destined for a first consulship (that of 307 being passed over) for 309. Constantine, with his customary union of prudence and decision, tacitly ignored this arrangement; he continued to bear the title of Augustus, and in 309, when he himself was proclaimed consul (with Licinius) in the East, no consuls were recognized in his dominions. In 310, while Constantine was engaged in repelling an inroad of the Franks, Maximianus endeavoured to resume the purple at Arelate (Arles). Constantine returned in haste from the Rhine, and pursued Maximianus to Massilia, where he was captured and put to death. Since Constantine's legal title to the Empire of the West rested on his recognition by Maximianus, he had now to seek for a new ground of legitimacy, and found it in the assertion of his descent from Claudius Gothicus (g.v.), who was represented as the father of Constantius Chlorus. Constantine I.'s patience was soon rewarded. In 311 Galerius died, and Maximinus Daia (who had assumed the style of Augustus in 310) at once marched to the shores of the Bosporus and at the same time entered into negotiations with Maximentius. This threw Licinius into the arms of Constantine, who entered into alliance with him and betrothed his half-sister Constantia to him. In the spring of 312 Constantine crossed the Alps, before Maximentius, who had been obliged to suppress the rebellion of Domitius Alexander in Africa, had completed his preparations. The force he commanded was of uncertain strength; according to his Panegyrist (who may have underrated it) it consisted of about 35,000, according to Zonaras of nearly 100,000 men. Constantine besieged and took the cities of Treves, Verona, and Marche straight for Rome. This bold and almost desperate move, which contrasted strongly with Constantine's usual caution, and seemed to court the failure which had befallen Severus and Galerius, was, it would seem, the result of an event which, as told in Eusebius's Life of Constantine, takes the form of a conspicuous miracle—the vision of the Flaming Cross which appeared in the sky on any day with the legend 'Ev totró pia ('By this conquer'), and led to Constantine's conversion to Christianity. Eusebius professes to have heard the story from the lips of Constantine; but he wrote after the emperor's death.

1 The praenomina Lucius, Marcus and Gaius are found in various inscriptions. In reality Constantine, like his father and successors, bore no praenomen.

2 His age at death is variously stated at 62 (Aur. Vict.), 63 (Epit. de Caes), 64 (Euseb.), 65 (Zonaras and Socrates) and 66 (Eutropius) years. Seeck has shown that these statements are false, and that Constantine was born in or about the year 288 A.D.

The story told in the De mortibus persecutorum (cap. 30) of a later conspirator of Maximianus, which failed owing to the fidelity of Fausta, is most probably a fiction.
death; and it was evidently unknown to him in the shape given above when he wrote the _Ecclesiastical History_. The author of the work, Eusebius, who was a well-informed contemporary, and he tells us that the sign was seen by Constantine in a dream; and even Eusebius supplements the vision by day with a dream in the following night. In any case, Constantine, who may have been impressed by the misfortunes which had befallen the more strenuous opponents of Christianity, adopted the monogram as his device and staked his all on the issue.

Maxentius, trusting in superiority of numbers,—he is said to have had 170,000 infantry and 18,000 cavalry at his disposal, but this total probably includes the forces defeated by Constantine in Northern Italy—marched out of Rome and prepared to dispute the passage of the river by the Pons Mulvius (Ponte Molle), beside which a bridge of boats was constructed. Our authorities give no satisfactory account of the battle which followed, and Aurelius Victor places it at Saxa Rubra, a statement accepted by Moltke and other modern authorities. It is more probable, as Seck has shown, that while the head of Maxentius's column may have reached Saxa Rubra (which is some miles to the north of the Mulvian Bridge on the Via Flaminia), Constantine, by a rapid turning movement, reached the Via Cassia and attacked Maxentius's rear guard at the bridge, forcing him to fight in the narrow space between the hills and the river. The army which Constantine had been training for six years at once proved its superiority. The Gallic cavalry swept the left wing of the enemy into the river, swollen with autumn rains, and with it perished Maxentius, owing, as was said, to the collapse of the bridge of boats (Oct. 28). The remainder of his troops surrendered at discretion and were incorporated by Constantine in the ranks of his army, with the exception of the praetorian guard, which was finally disbanded. Thus Constantine became undisputed master of Rome and the West, and Christianity, although not as yet adopted as the official religion, secured by the edict of Milan toleration throughout the Empire. This edict was the result of a conference between Constantine and Licinius in 313 at Milan, where the marriage of the latter with Constantia took place. Constantine was forced to recognize Licinius's natural son as his heir. In the course of the same year Licinius defeated Maximinus Daia, who perished at Tarsus by his own hand. In 314 war broke out between the two Augusti, owing, as we are told, to the treachery of Bassianus, the husband of Constantine's sister Anastasia, for whom he had claimed the rank of Caesar. After two hard-fought victories Constantine made peace, Illyricum and Greece being added to his dominions. Constantine and Licinius held the consularship in 315, in which year the former celebrated his decennalia, and on the 1st of March 317 Constantine's two sons and Licinius's bastard were declared Caesars.

Peace was preserved for nearly nine years, during which the wise government of Constantine strengthened his position, while Licinius (who resumed the persecution of the Christians in 321) steadily lost ground through his indolence and cruelty. Great armaments, both military and naval, were called into being; and in the spring of 324 Licinius (whose forces are said to have been superior in numbers) declared war. He was twice defeated, first at Adrianople (July 1) and afterwards at Chrysopolis (Sept. 18), when endeavouring to raise the siege of Byzantium, and was finally captured at Nicomedia. His life was spared on the intercession of Constantia and he was interned at Thessalonica, where he was executed in the following year on the charge of treasonable correspondence with the barbarians. The name _labrum_, given to the military standards bearing the monogram, is of unexplained origin. Lactantius says that the symbol was first adopted by Constantine and the standards of his troops.

The battle was called after the Milvian bridge is indicated by a relief and inscription from Cherchel (C.I.L. viii. 9356).

It has been disputed whether the final struggle between Constantine and Licinius took place in A.D. 323 or 324; but the formulae employed in the dating of Egyptian papyri seem to point to the latter year (see _Comptes-rendus de l'académie des inscriptions_, 1906, p. 231 ff.).

Constantine now reigned as sole emperor in East and West. He presided at the council of Nicaea (see under NICAEA and Constans) in 325; in the same year he celebrated his _Vindiciation_ in the East, and in 326 repeated the celebration in Rome. Whilst he was in Rome his eldest son, Crispus, was banished to Pola and there put to death on a charge brought against him by Fausta. Shortly afterwards, as it would seem, Constantine became convinced of his innocence, and ordered Fausta to be executed. The precise nature of the circumstances remains a mystery.

In 326 Constantine determined to remove the seat of empire from Rome to the East, and before the close of the year the foundation-stone of Constantinople was laid. At least two other sites—Sardica and Troy—were considered before the emperor's choice fell on Byzantium. It is very probable that this step was connected with Constantine's decision to make Christianity the official religion of the empire. Rome was naturally the stronghold of paganism, to which the great majority of the senate clung with fervent devotion. Constantine did not wish to do open violence to this sentiment, and therefore resolved to found a new capital for his new empire of his creation. He announced that the site had been revealed to him in a dream; the ceremony of inauguration was performed by Christian ecclesiastics on the 11th of May 326, when the city was dedicated to the Blessed Virgin.

In 332 Constantine was called in to aid the Sarmatians against the Goths over whom his son gained a great victory on the 20th of April. Two years later there was again fighting on the Danube, when 300,000 Sarmatians were settled in Roman territory. In 335 a rebellion in Cyprus gave Constantine an excuse for executing the younger Licinius. In the same year he carried out a partition of the empire between his three sons and his two nephews, Delmarius and Hannibalianus. The last named received the vassal-kingdom of Pontus with the title of rex regum, while the others ruled as Caesars in their several provinces. Constantine, however, retained the supreme government, and in 335 celebrated his _tricennalia_. Finally, in 337, Shapur (Sapor) III. of Persia asserted his claim to the provinces against Maximus and Diocletian, and war broke out. Constantine was preparing to lead his army in person, when he was taken ill, and after a vain trial of the baths at Helenopolis, died at Anchon, a suburb of Nicomedia, on the 22nd of May, having received Christian baptism shortly before at the hands of Eusebius. He was buried in the church of the Apostles at Constantinople.

It has been said by Stanley that Constantine was entitled to be called "Great" in virtue rather of what he did than of what he was; and it is true that neither his intellectual nor his moral qualities were such as to earn the title. His claim to greatness rests mainly on the fact that he divined the future which lay before Christianity, and determined to enlist it in the service of his empire, and also on his achievement in completing the work begun by Aurelian and Diocletian, by which the quasi-constitutional monarchy or "Principate" of Augustus was transformed into the naked absolutism sometimes called the "Dominate." There is no reason to doubt the sincerity of Constantine's conversion to Christianity, although we may not attribute to him the fervent charity of faith which he attributed to him, nor accept as genuine the discourses which pass under his name. The moral precepts of the new religion were not without influence upon his life, and he caused his sons to receive a Christian education. Motives of political expediency, however, caused him to delay the full recognition of Christianity as the religion of the state until he became sole ruler of the empire, although he not merely secured toleration for it immediately after his victory over Maxentius, but intervened in the Donatist controversy as early as 313, and presided at the council of Arles in the following year. By a series of enactments immunities and privileges of various kinds were conferred on the Catholic Church and clergy—heretics being specifically excluded—and the emperor's attitude towards paganism gradually revealed itself as one of contemptuous toleration. From being the established religion of the state it sank into a mere _superstition_.

CONSTANTINE I.
CONSTANCE I.

At the same time its rites were allowed to subsist except where they were held to be subversive of morality, and even in the closing years of Constantine's reign we find legislation in favour of the municipal flamines and collegia. In 333, or later, a cult of the Genus Flavia, as the Imperial family was called, was established at Hispellum (Spello); the offering of sacrifices in the new temple was, however, strictly prohibited. Nor was it until after Constantine's final triumph over Licinius that pagan symbols disappeared from the coinage and the Christian monogram (which had already been used as a mint mark) became a prominent device. From this time forward the Arian controversy demanded the emperor's constant attention, and by his action in presiding at the council of Nicaea and afterwards pronouncing sentence of banishment against Athanasius he not only identified himself more openly than ever with Christianity, but showed a determination to assert his supremacy in ecclesiastical affairs, holding no doubt that, as the office of pontiff maximus gave him the supreme control of religious matters throughout the empire, the regulation of Christianity fell within his province. In this matter his discernment failed him. It had been comparatively easy to apply coercion to the Donatists, whose resistance to the temporal power was not wholly due to spiritual considerations, but was largely the result of less pure motives; but the Arian controversy raised fundamental issues, which to the mind of Constantine appeared capable of compromise, but in reality, as Athanasius rightly discerned, disclosed vital differences of doctrine. The result foreshadowed the process by which the church which Constantine hoped to mould into an instrument of absolutism became its most determined opponent. It is unnecessary to give more than a passing mention to the legend according to which Constantine, smitten with leprosy after the execution of Crispus and Fausta, received absolution and baptism from Silvester I, and by his Donation to the bishop of Rome laid the foundation of the temporal power of the papacy (see Donation of Constantine).

The political system of Constantine was the final result of a process which, though it had lasted as long as the empire, had assumed a marked form under Aurelian. It was Aurelian who surrounded the imperial person with oriental pomp, wearing the diadem and the jewelled robe, and assuming the style of dominus and even deus, who assimilated Italy to the condition of the provinces and gave official furtherance to the economic process by which a régime of status replaced a régime of contract. Diocletian endeavoured to secure the new despotism against military usurpation by an elaborate system of co-regency with two lines of succession, bearing the names of jovii and herculti, but maintained by adoption and not by hereditary succession. This feudal military system was destroyed by Constantine, and established dynastic absolutism in favour of his own family, the gens Flavia, evidence of whose cult is found both in Italy and in Africa. To form a crown he created a new official aristocracy to replace the senatorial order, which the military emperors of the 3rd century A.D. had reduced to practical insignificance. Upon this aristocracy he showered titles and distinctions, such as the revised patriciate, which carried with them the coveted immunity from fiscal burdens. As the senate was now a quantité négligeable, Constantine could afford to readmit its members freely to the career of provincial administration, which had been almost closed to them since the reign of Galerius, and to accord to it certain empty privileges such as the free election of quaestors and praetors, while on the other hand the right of the senator to be tried by his peers was taken away and he was placed under the jurisdiction of the provincial governor.

In the administration of the empire Constantine completed the work of Diocletian by effecting the separation of civil from military functions. Under him the proiecti praetorio ceased entirely to perform military duties and become the heads of the civil administration, more especially in the matter of jurisdiction: in 335 their decisions were made final and no appeal to the emperor was permitted. The civil governors of the provinces (vicarii and proconsules) had no control of the military forces, which were commanded by duces; and not content with the security against usurpation which was afforded by this division of power, Constantine employed the comites who formed a large element in the official aristocracy to supervise and report upon their conduct of affairs (see COUNT), as well as an army of so-called agentes in rebus who, under colour of inspecting the Imperial posting service, carried on a wholesale system of espionage.

In the organization of the army the creation of a field force (comitatus) beside the permanent frontier-garrisons (limitani) was probably the work of Diocletian; to Constantine is due the creation of the great commands under the magistri pedalium and equitum. He also introduced the practice, afterwards to become general among barbarians, especially Germans, in posts of high responsibility.

The organization of society in strictly hereditary corporations or professions was no doubt partly completed before the accession of Constantine; but his legislation contributed to rivet the fetters which bound each individual to the caste from which he sprung. Such origines are mentioned in Constantine's earliest laws, and in 332 the hereditary status of the agricultural colonus was recognized and enforced. Above all, the municipal decuriones on whom the responsibility for raising taxation rested saw every avenue of escape closed against them. In 326 they were forbidden to acquire immunity by joining the ranks of the Christian clergy. It was the interest of the government by such means to secure the regular payment of the heavy fiscal burdens both in money and in kind which had been laid on the subjects of the empire by Diocletian and were certainly not diminished by Constantine. One of our ancient authorities speaks of him as having been for ten years an excellent ruler, for twelve a robber and for ten a spendthrift, and he was constantly forced to have recourse to fresh exactions in order to enrich his favourites and to carry out such extravagant projects as the building of a new capital. To him are due the taxes known as collatio globalis, levied on the estates of senators, and collatio lustralis, levied on the profits of trade.

In general legislation the reign of Constantine was a time of feverish activity. Nearly three hundred of his enactments are preserved to us in the Codes, especially that of Theodosius. They display a genuine desire for reform and distinct traces of Christian influence, e.g., in their humane provisions as to the treatment of prisoners and slaves and the penalties imposed on offences against morality. Nevertheless they are in many cases contradictory, and very irregular in content as well as in date, and were manifestly drafted by official rhetoricians rather than by trained legis. Like Diocletian, Constantine believed that the time had come for society to be remodelled by the fiat of despotic authority, and it is significant that from henceforth we meet with the undisguised assertion that the will of the emperor, in whatever form expressed, is the sole fountain of law. Constantine, in fact, embodies the spirit of absolute authority which, both in church and state, was to prevail for many centuries.

Authorities.—The principal ancient sources for the life of Constantine are the biography of Eusebius, which is, however, partial and untrustworthy owing to the ecclesiastical bias of its author (whose Ecclesiastical History is a labour of love), the tract de mortibus persecutorum ascribed to Lactantius, the orations of the Pontifical, Nos. vi.-x., the second book of the history of Zosimus (which is written from the pagan standpoint), the so-called Excerpta aus der Zeit Augustus bis Constantins des Grossen (1817), Jacob Burckhardt, Die Zeit Constantins des Grossen (2nd ed., 1880), H. Schiller, Geschichte der römischen Kaiserzeit, ii. 2, 164 ff. (1897), and above all Seeck, Geschichte des Unter- gangs der antiken Welt, vol. i. (2nd ed., 1897). For a short account in English C. H. Firth's Constantine the Great (1905) may be consulted.

(H. S. J.)

1 The watchword Quid est imperatori cum ecclesia? belongs to a later period.
2 These titles were so freely bestowed that in A.D. 326 Constantine found it necessary in the interest of the treasury to enact that the fiscal immunity which they carried should no longer be hereditary.
Constantine II. (317–340), son of Constantine the Great, Roman emperor (337–340), was born at Arleate (Arles) in February 317. On the 1st of March in the same year he was created Caesar, and was consul in 320, 321, 324 and 329. The fifth anniversary of his Caesarship was celebrated by the panegyrist Nazarius (q.v.). He gained the credit of the victories of his generals over the Alamanni (331, for which he received the title Alamannicus), and over the Goths (332). From 335 he administered the Gallic portion of the empire as Caesar till his father’s death (22nd of May 337). On the 9th of September in the same year he assumed the title of Augustus, together with his brothers Constant and Constans, and in 338 a meeting was held at Viminacium, on the borders of Pannonia, to arrange the distribution of the empire. In accordance with the arrangements made by his father, Constantine received Britain, Spain and the Gauls; Pontus, Asia, the East, and Egypt fell to Constant; Africa, Pannonia and the Italies to the youngest brother Constans, whose dominions were further increased by the addition of Macedonia, Dalmatia and Thrace, originally intended for Delmatius, a nephew of Constantine I. and one of the victims of the general massacre of that emperor’s kinmen. By virtue of his seniority, Constantine claimed a kind of control over his brothers. Constans, an ambitious youth encouraged by intriguing advisers, declined to submit; and Constantine, jealous of his prerogatives and dissatisfied with his share in the empire, demanded from Constans the cession of Africa and equal authority in Italy. After protracted but unavailing negotiations, Constantine in 340 invaded Italy. He had advanced far as Aquileia, when he fell into an ambuscade and lost his life. His body was thrown into the little river Alsa, but subsequently recovered and buried with royal honours.

Constantine III., son of the emperor Heraclius (d. 641) by his first wife Eudocia, succeeded his father as joint-emperor with Heracleonas, the son of Heraclius by his second wife Martina. Court intrigues nearly led to a civil war, which was prevented by the death of Constantine (May 641), after a brief reign of 103 days. He was supposed to have been poisoned by order of his step-mother Martina.

Constantine IV. Pogonatus (the “bearded”), son of Constans II., was emperor from 668 to 685. After his father’s death he set out for Sicily, where an Armenian named Mzizibis had been declared emperor. Having defeated and put the usurper to death, he returned to the capital. For six years (672–677) the Arabs under the caliph Moawiya (see CALIPHATE) besieged Constantinople, but the ravages caused amongst them by the so-called “Greek fire,” heavy losses by land and sea, and the inroads of the Christian Mardaîtes (or Maronites, q.v.) of Mount Lebanon, obliged Moawiya to make peace and agree to pay tribute for thirty years. The attacks of the Slavs and Avars upon Thessalonica were heroically repulsed by the inhabitants. But Constantine, exhausted by the war with the Arabs, was unable to prevent the Bulgars, a tribe of Finno-Ugrian race, from crossing the Danube and settling in the district where their name still survives. The Bulgarian kingdom was established under its first king Isperich in 679. The tribute paid by the Arabs was used to purchase the good will of the new settlers. In order to restore peace in the church, Constantine summoned an ecumenical council (the sixth) at Constantinople, which held its sittings from the 7th of November 680 to the 10th of September 681. The result was the condemnation of the Monothelites and a recognition of the doctrine that two wills, neither opposed nor intermingled, were united in the person of Christ, in accordance with his twofold nature (see under CONSTANTINOPEL, COUNCILS OF).

Constantine V. Coemperor (Gr. kôrpos), son of Leo III., the iconoclast, was emperor 740–775. Immediately after his accession, while he was engaged in a campaign against the Arabs, his brother-in-law, an Armenian named Arvatavasdis, a supporter of the image-worshippers, had been proclaimed emperor, and it was not till the end of 743 that Constantine re-entered Constantinople. When he felt his position secure, he determined to settle the religious controversy once for all. In 754 he assembled at the palace of Hieroïon 338 bishops, by whom the worship of images was forbidden and a proposed to an Christian doctrine and a curse pronounced upon all who should it. But in spite of the severity with which the resolution was enforced, the resistance to iconoclasm continued, chiefly owing to the attitude of the monks, who exercised great influence over the common people. A vigorous campaign against monasticism took place; the monasteries were closed, and many of them pulled down or converted into barracks; monks and nuns were compelled to marry, and exiled in large numbers to Cyprus; the literary and artistic treasures were sold for the benefit of the imperial treasury. One of the most important results of the struggle was the defection of the pope, who sought and obtained protection from Pippin, king of the Franks. All attempts to induce Pippin to throw over his new protegé failed, and from this time onward the nominal dependence of Rome and the papacy on emperors at Constantinople ceased. Constantinople has been described by the orthodox historians of his time as a monster of iniquity; but, in spite of the harshness and occasional cruelty with which he treated his religious opponents, for which an excuse may be found in the obstinate fanaticism of the monks, it is now generally admitted that he was one of the most capable rulers who ever occupied the Byzantine throne. He restored the aqueduct built by Valens and destroyed by the barbarians in the reign of Heraclius, re-peopled Constantinople (after it had been devastated by a great plague) and some of the cities of Thrace, revived commercial prosperity, and carried on a number of wars, in which, on the whole, he was successful, against the Arabs, Slavs and Bulgarians. In the year of his death he set out on an expedition against the last-named, but a violent attack of fever obliged him to discontinue his journey. He died on board his fleet on his way home.

Constantine VI., grandson of Constantine V., was emperor 780–797. At ten years of age he succeeded his father, Leo IV., under the guardianship of his mother Irene (q.v.), who held the reins of government for ten years. In 782 the Arabs under Harun al-Rashid penetrated as far as the Bosporus, and exacted an annual tribute as the price of an inglorious peace (see CALIPHATE, § C, 3rd ed. fn.). Even when Constantine came of age, Irene practically retained the supreme power. At length, Constantine had her arrested, but foolishly pardoned her shortly afterwards. Disastrous campaigns against the Bulgarians and Arabs afforded her an opportunity of rousing the contempt and hatred of the people against their ruler. On his return to Constantinople, Constantine managed to escape to the Asiatic coast, but being brought back practically by force he was seized and blinded. According to some, he died on the same day; according to others, he survived for several years. With Constantine VI. the Syrian (Isaurian) dynasty became extinct.

See Theophanes, and the biographies of the patriarch Tarasius and Theodore of Studium; also F. C. Schlosser, Geschicte der bildstürmenden Kaiser des oströmischen Reichs (Frankfurt-am-Main, 1812); other works s.d. IRENE.

Constantine VII. Porphyrogennetus (Gr. Porphyrogennétos, “born in the purple”) (905–959), East Roman emperor, author and patron of literature, was the son of Leo VI. the Wise. Though nominally emperor from 912–959, it was not until 945 that Constantine could really be called sole ruler. During this period he had been practically excluded from all real share in the government by ambitious relatives. Though wanting in strength of will, Constantine possessed intelligence and many other good qualities, and his reign on the whole was not unsatisfactory. He was poisoned by his son Romanus in 959. Constantine was a painter and a patron of art, a literary man and a patron of literature; and herein consists his real importance, since it is to works written by or directly inspired by him that we are indebted for our chief knowledge of his times. He was the author or inspirer of several works of considerable length. (1) De Themalibus, an account of the military districts (Themata)
of the empire during the time of Justinian, chiefly borrowed from Hierocles and Stephanus of Byzantium. (2) De administrando imperio, an account of the condition of the empire, and an exposition of the author's view of government, written for the use of his son Romanus; it also contains most valuable information as to the condition and history of various foreign nations with which the Byzantine empire had been brought into contact on the east, west and north. (3) De cerimonialia adae Byzantinae, which describes the customs of the Eastern Church and court. (4) A life of Basilius I., his grandfather, based on the work of Genesius. (5) Two treatises on military subjects are attributed to him; one on tactics, which, as the title shows, was really written by his grandson Constantine VIII., the other a description of the different methods of fighting in fashion amongst different peoples. (6) A speech on the despatch of an image of Christ to Abgar, king of Edessa. Of works undertaken by his instructions the most important were the Encyclopaedic Excerpts from all available treatises on various branches of learning. (1) Historia, in 53 sections, devoted to a special subject; of these the sections De legationibus, De virtutibus et vitiiis, De sentenziis, De insidiae, have been wholly or partly preserved. (2) Basilica, a compilation from the different parts of the Justinianus Corpus Juris, subsequently the text-book for the study of law. (3) Genesius, agricultural treatises, for which see Genesius and Bassus, CASSIUS. (4) Iatria, a medical handbook compiled by one Theophanes Nonnus, chiefly from Orisabus. (5) Hippiatria, on veterinary surgery, the connexion of which with Constantine is, however, disputed. (6) Historia animalium, a compilation from the epistles of Aristotle's work on the subject by Aristophanes of Byzantium, with additions from other writers such as Aelian and Timotheus of Gaza.

On Constantin VII. generally the most important work is A. Rambaud, L'Empire grec au xième siècle (1870); see also Gibbon, Decline and Fall, ch. 53. G. Finlay, Hist. of Greece, ii. 294 (1877). Many of his works will be found in Migne, tourlogia Graeca, cit., exc., citii., citii.; for editions of the rest, C. Krummacher, Geschichte der byzantinischen Literatur (1897), and the article by Cohn in Pauly-Wissowa's Realencyclopaedie der classischen Altertumswisssenschaft (1900) should be consulted. The former contains a valuable note on the "gothic Christmas", described in detail in the De cerimonialis; see also Bury in Eng. Hist. Rev. xii. (1907).

CONSTANTINE VIII. This title is given by Gibbon to the son of Romanus I. Lecapenus, one of the colleagues of Constantine VII. Porphyrogenitus, but it is now generally bestowed upon Constantine, the brother and colleague of Basil II. from 976-1025, sole ruler 1025-1028. An absolute contrast to his brother, he gave himself up to a life of pleasure and allowed the administration to fall into the hands of six eunuchs.

CONSTANTINE IX. Monomachus, emperor 1042-1054, owed his elevation to an old admirer, Zoë, the widow of Romanus III. Argyrus (1028-1034) and of Michael IV. the Paphlogionion (1034-1041), who, after the brief reign of Michael V. Calaphates (December 1041-April 1042), was proclaimed emperor with her sister, Theodora. Quarrels broke out between the sisters, and, in order to secure her position, Zoë married Constantine, with whom she shared the throne till her death in 1050. In his old age Constantine, who had once been a famous warrior, utterly neglected the defence of the empire and reduced his army by disbursing 30,000 of his best troops; on the other hand, he spent extravagant sums on luxuries and the erection of magnificent buildings. Rebellions broke out at home and abroad; the Normans conquered Lombardy, which subsequently (1055) became the duchy of Apulia, and thus Italy was lost to the empire; the Petchenecs (Patzinaks) crossed the Danube and attacked Thrace and Macedonia; and the Seljuk Turks made their appearance on the Armenian frontier.

CONSTANTINE X. Ducas, emperor 1059-1067, succeeded Isaac I. Comnenus (q.v.). But the choice was not justified, for Constantine, who as the friend and minister of Isaac had shown himself a capable statesman and financier, proved incompetent as an emperor. He devoted himself to philosophical trifling, petty administrative and judicial details, while his craze for economy developed into avarice. He reduced the army, cut down the soldiers' pay, failed to keep up the supply of war material, and neglected the frontier fortresses at a time when the Seljuk Turks were pressing hard upon the eastern portion of the empire. Alp Arslan, the successor of Toghrul Beg, overran Armenia in 1064, and destroyed its capital Ani. The Magyars occupied Belgrade, the Petchenecs (Patzinaks) continued their inroads, and in 1065 the Uzes (called by the Greeks Comani), a Turkish tribe from the shores of the Euxine, crossed the Danube in vast numbers, ravaged Thrace and Macedonia, and penetrated as far as Thessalonica. The empire was only saved by an outbreak of plague amongst the invaders and the bravery of the Bulgarian peasants. In the year before Constantine's death the remnant of the Byzantine possessions in Italy was finally lost to the empire, and the chief town, Bari, taken by the Normans.

For the later Constantines references to general authorities will be found under ROMAN EMPIRE, LATER; see also CALIPHATE and SELJUKS for the wars of the period.

CONSTANTINE [FLAVIUS CLAUDIUS CONSTANTINUS], usurper in Britain, Gaul and Spain (A. D. 407-410) during the reign of Honorius, was a common soldier, invested with the purple by his comrades in Britain by reason of his alleged descent from Constantine the Great. He at once crossed over to Bononia (Boulone), and with the support of the Gallic troops soon made himself master of the country as far as the Alps and Pyrenees, and established his capital at Arelate (Arles). In Spain two kinsmen of Honorius, who offered considerable resistance, were finally defeated by Constans, the son of Constantine. The downfall of Stilicho caused an alteration in the policy of Honorius, who, hard pressed by the barbarians, pardoned Constantine, recognized him as joint ruler, and permitted him to confer the title of Caesar upon Constans. This gave Constantine his opportunity. With a large army he marched into Italy, avowedly to assist Honorius, in reality with the intention of making himself ruler of the West. But his plans were upset by the revolt of Genertius. This capable general, who had been appointed commander in Spain during the absence of Constans on a visit to his father, indignant at being superseded, set up one of his own adherents as emperor, invaded Gaul, and put Constans to death at Vienna (Vienne). He then besieged Constantine himself at Arelate, but the advance of an Italian army under Constantius and Ulphiias forced him to retire. The generals of Honorius themselves continued the siege and completely defeated a body of German troops on their way to assist Constantine. The latter, seeing that further resistance was useless, took refuge in a church, laid down the imperial insignia, took orders as a priest, and surrendered the city on condition that his life should be spared. He and his younger son Julian were sent to Honorius, by whose orders they were put to death on the way to Ravenna. The revolt of Constantine materially influenced the subsequent history of Britain, since the virtual abandonment by Honorius of any claim to sovereignty over it cleared the way for the Saxon conquest of the island.
